CHEESE.—The market is without new features. Exporters are operating moderately, and there is a fair home trade demand; fancy factories bring up to 13½c.

New State factory, fancy, 13¾@13½c.; fine, 12½c.; do. good to prime, 11¾@12¾c.; fair to good, 10@11¾c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12¾c.; good to prime, 10¾@11¾c.; fair to good, 9¼@10¾c. Western factory, cheddar, fine, 12@12½c.; good to prime, 11@12c.; flat fine, 12¾@13c.; good to prime, 11@12c.; fair, 8@10c.; poor to fair, 6@8c.; pineapple, 16@18c. English dairy, Connecticut, 12@13½c., do. State, 14@15c.

COTTON.—With larger receipts at the Southern ports and dull markets in Liverpool, prices here are easier. Latest sales for February, 12 15-16c.; March, 13 5-32c.; April, 13¾c.; May, 13 19-32c.; June, 13 31-32@14c.; July, 13 31-32@14c.; August, 14 1-16@14 3-32c.

DOMESTIC DRIED FRUITS.—Apples are held higher, with stocks considered small, and a better jobbing demand; otherwise, trade is of a restricted character, with prices about nominal. The late consignment of California raisins consisted of 1,000 boxes of 20 lbs. each, quoted at 10@12½c. ⅘ lb.

Apples—State, sliced, 10@10½c.; quarters, 9¼@9½c.; Western quarters, 9c.; Southern sliced, 1875 crop, 10½c. for prime, and fancy 12c.; Tennessee qrs., 8¼@8½c. Blackberries, new, 12@c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12½c. for halves, 11@11½c. for quarters. Plums, 20c. Raspberries, 28c. Cherries, 22@23c.

EGGS.—The market has been drooping all of the week. To-day the first real snow storm for the season adds a little strength to prices. Still, buyers have loaded up pretty heavily during the late low turn of prices, and it will require winter weather of some duration to create firmness. One thing in favor of sellers is the fact that lately-received stock is in good condition, and curtailed supplies, in the advent of obstructed roads, will stiffen the feeling.

We quote near points, 19¾@20c.; State and Pennsylvania, 19¾—c.; Canadian, choice, 19¾—c; Western, do., 01@—c.; other Western, 19¾—c.; Southern, 18c.; Limed, 12@13c.

FLOUR.—Export trade has fallen off, while the arrivals are larger than had been expected and prices are weak. We quote:

Superfine State, $4.25@4.60; extra do., $4.85@5.10; superfine Western, $4.25@4.60; extra do., $4.85@5.20; No. 2, $3.50@4.00 extra round-hoop Ohio, $4.90@5.35 trade brands do., $5.35@7.40; white wheat extras, $6.95@7.00; St. Louis, $5.20@9.00; City Mills extra, $5.01@8.50. Southern at $4.15@4.70 for superfine; $4.75@6.25 for poor to choice shipping extras; $6.20@8.75 for trade and family brands.

FRESH FRUITS.—Exports of apples since Jan. 1st, 1,325 bbls.; same time last year, 4,193 do. Apples are dull, but the stock of choice is not oppressive, and holders are asking full former rates for fine red fruit. Off qualities are irregular and favor the buyer. Railroad lots largely contribute to the latter grades. California pears are out of first hands. Cranberries are scarce and look ton profitable wind-up. Peanuts are in good demand. Hickory nuts not wanted. Domestic oranges arrive in bad order.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; other $1.50@2. Cranberries—Jersey, choice, bush. crates, full measure, $3.50@3.75; good to prime, $2.25@3.50; made bbls., $11@12.50. Nuts—Peanuts, Virginia, $1.60@1.90; do. Wilmington, $1.90@2.10; do. Tennessee, 75@90c.; Hickory nuts, $1@1.25. Black walnuts, 50c.

FURS AND SKINS.—The market is fairly firm, without business. We quote prime skins:

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50
Cat, Wild, North and East States, cased	50 to 60
Cat, Wild, Southern and Western	40 to 50
Fisher, Northern and Eastern	7 00 to 12 00
Fisher, Southern and Western	3 00 to 8 00
Fox, silver	15 00 to 50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00 to 5 00
Fox, Red, Northern and Eastern, according to size and color	1 50 to 1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25 to 1 50
Fox, Red, Southern and Western	75 to 1 00
Fox, Gray, North and Eastern, cased	75 to 1 00
Fox, Gray, South and West	40 to 60
Fox, Kitt	30 to 50
Lynx	1 00 to 2 00
Marten, Stones	1 50 to 2 00
Mink, New York and New England	3 00 to 4 00
Mink, Can., Mich., and Minn	2 00 to 3 00
Mink, New Jersey, Pennsylvania, and Ohio	1 00 to 1 50
Mink, Maryland, Virginia, Kentucky, Indiana, Wisconsin and Iowa	75 to 1 25
Missouri and all Southern	50 to 75
Muskrat, N. and East'n, fall & winter	25 to 27
Muskrat, West, including Penn. and Ohio, winter	22 to 25
Muskrat, Southern prime winter and fall	12 to 20
Otter, North'n and Eastern and North-West	10 00 to 12 00
Otter, Penn., N. J., Ohio and Western	6 00 to 10 00
Otter, South Carolina and Georgia	2 00 to 6 00
Opossum, North, cased	18 to 20
Opossum, South and open North	12 to 15
Raccoon, Mich., N. Ind., N. Ohio, Indiana handled, dark	80 to 1 00
Raccoon, Ill., Iowa, Wis. and Minn	50 to 65
Raccoon, N. Y. and E. States & N. Penn	65 to 75
Raccoon, N. J., S. Penn., Ind., Ill., Mo., Neb. and Kan	40 to 50
Raccoon, Md., Va., Ky., Tenn., N. and S. Car., Geo., Ark., Fla. and Ala	15 to 40
Rabbits, prime, cased	2 00 to 3 00
Skunks, prime black, No. 1, cased	— to 1 30
Skunks, prime black, No. 1, open	— to 1 00
Skunks, prime one-half white streak	50 to 80
Skunks, whole streaked	15 to 20
Wolf Skins, mountain, large	2 00 to 3 00
Wolf Skins, prairie, prime	75 to 1 25

GRAIN.—Wheat has been hard to sell, reports from abroad showing full stocks, and prices have been lower and closed weak. Prime No. 2 Milwaukee spring quoted held at $1.20, $1.18 offered; $1.18@1.20 for No. 2 spring; $1.18@1.17 for winter red and amber; $1.35@1.55 for white and $1.30@1.37 for No. 1 spring. Rye at 95c. for State. Barley at 85@88c. for two-rowed State, and 93c. for two-rowed Canada. Corn is lower, with less export demand. Sales at 62½@63c. for mixed Western; 63½c. for yellow do.; 64½c. for new white Southern. Oats are lower and dull; mixed State 47c.; white State at 50c. White Western at 49@50c.

HAY AND STRAW.—Receipts have been a little larger through the open weather, and it has been difficult to sustain unchanged prices.

Bale hay is quoted:—Shipping, 85c.; retail qualities, $1.05@1.15; clover, 70@80c.; salt, 65@70c. Straw is quoted at $1.10@1.20 for long rye; 80@90c. for short rye; 75@85c. for oat.

HIGHWINES.—Higher; selling at $1.11.

HOPS.—Prices are advanced on medium and choice grades. Export trade has continued fair, while supplies of choice are running low.

New York State, 12@17c.; Eastern, 10@15c.; Wisconsins, 10@13c; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias, 17@20c.

MILK.—The season is still marked with low prices for commission milk; the range has been $1.25@2, with much left unsold.

MAPLE SUGAR.—As one of the curiosities of this remarkably open winter, sap has been obtained in Delaware Co. at this early date.

POULTRY AND GAME.—Dressed poultry is doing fairly, but it is mainly because we are not overcrowded with stock, and even with the moderate supply prices are not extravagant. We quote:

Turkeys, N. J., choice, 15@16c.; do. other, 12@14c.; State, prime, 14@15c.; do. other, 12@13c.; Western, prime, 13@14c.; other, 10@12c. Chickens, N. J., prime, 15@16c.; other, 12@14c. State, prime, 13@14c.; State, 11@12c.; Western, prime, 12@12c.; do. other, 8@11c. Fowls, choice, 12@14c. Ducks, N. J., 17@19c.; State and Western, 16@17c.; Geese, Western, 10@11c.

Live poultry is in demand as follows:

Turkeys, Jersey, ⅘ lb., 12c.; do. Western, 10@12c.; Geese, Jersey, ⅘ pair, $2.50@3; do, Western, $1.50@1.75; ducks, Western, ⅘ lb., 65@75c.; ducks, Jersey, ⅘ pair, 1@1.20; fowls and chickens, State and Jersey, ⅘ lb., 12@13c.; do. Western, 10@13c.; roosters, 7@8c.

Quail, trapped, prime, ⅘ doz., $3.75@4.00; soft, $2.50@3.00. Grouse, prime, ⅘ pair, $1.12@1.25; drawn, 80@1.00 Partridges, choice, ⅘ pair, $1.10@1.20; Hares, ⅘ pair, 20@30c. Rabbits, ⅘ pair, 30@35c. Ducks, canvas back, ⅘ pair, $1.50@2.50; redhead, $1@1.37; common, 50@75c.

PROVISIONS.—Mess pork is higher and very strong under a sharp speculative inquiry. Mess is quoted at $21.25@21.30 for February, $21.35@21.45 for March, $21.45@21.50 for April, $21.50@21.60 for May, $21.55@21.65 for June; extra prime, $16. Western prime mess, $19.75@20. Western dressed hogs, 9¼@9¾c. Boxed dry salted shoulders, 8¾c. Western dressed pickled hams, 12@12¾c. Bacon is scarce and wanted by export buyers at decidedly better prices; Western long clear, 11¾c.; long and short do., 11¼c.; long and short do. together, 11¾c.; short do., 12¾. Lard is stronger, with increased export demand; latest figures are—12-52½c. bid and 12-57½c. asked for February, 11-82½c. bid and 12-83c. asked for March, 12-95c. bid and 13c. asked for April, 13-05c. bid and 13-12½c. asked for May, 13-17½c. bid and 13-22½c. asked for June. Stearine at 14c. for prime Western. Prime tallow at 9¼@9¾c. Beef hams at $22@22.50 for Southern and $24@25 for Western. Beef—New extra mess, $12@12.50; do. plain mess, $11@11.50; do. tierced at $23 for prime mess, and $25 for India mess. City extra India mess, $31.50@32.50 Old extra mess, $11.50, and $10.50 for plain mess; packet, $15.50@16.50.

SALT.—Ashton's, $2.50; Denkin's, $1.45@1.50; Marshall's, Washington's and Worthington's, $1.45@1.50.

SEED.—Clover is scarce and wanted. Prime and choice, 10¾@11¾c.

SUNDRIES.—Honey remains quiet at 18@20c. for white clover comb and 10@12c. for dark and strained. Feathers, 58@60c. for prime Western: do. mixed, 30@45c.; hen and turkey feathers not wanted. Ginseng, $1.15@1.16 for Northern; $1.30@1.50 for Southern.

TOBACCO.—Exporters are taking a few small lots; with a light local trade, prices have varied slightly.

VEGETABLES.—Exports of potatoes, since Jan. 1st, 21,547 bbls.; same time last year, 11,831 do. Notwithstanding the low rates at which the stock of potatoes was laid in at, it seems likely that many will go to loss.

Early Rose, bulk, ⅘ bbl., $1.00@1.25; Peach Blows, $1.50@1.75; Prince Alberts, $1.00@1.25; Peerless, 65c.@$1.00. Sweet potatoes, $2.25@2.50. Cabbages, ⅘ 100, $3@5; red, $6@9. Cauliflower, bbl., $2@5. Squash, Marrow, bbl., 50@75c.; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@3.00. Russia Turnips, ⅘ bbl., 75c.; white, 60c. Carrots, $1.00. Baltimore spinach, ⅘ bbl., $1.50@2.

WOOL.—The market is very dull, only small lines selling; but as stocks are moderate, holders are firm for nearly all descriptions.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Feb. 5, 1876.

THE prospects look brighter this week, and dairymen feel encouraged that prices for cheese will soon advance, though there is not much change to note at present in the interior markets. Fine factory cheese of September and October make is held firmly at 13½@14c., with no sales to speak of, as dealers are hardly prepared to pay these prices. "Late ends" of factories may be quoted at 9@11c., according to quality.

Very small lots from farm dairies continue to come forward and sell at irregular prices, sometimes as low as 6c., and the better grades at 8@9c. We do not know of any strictly fancy farm dairy cheese in market.

There has been nothing but winter butter in the market this week, and sales are made at 22@25c. In a recent tour through Onondaga, Broome and Cortland Counties, we learned that considerable quantities of butter were in makers' hands, some few dairymen having half their season's stock.

We have advices from Europe up to the middle of January. Our London correspondent says:

Large transactions in American cheese are reported, and the market fairly cleared of old stocks and low qualities.

American extra, 64@65s.; fine, 63@64s.; good, 56@60s.; common, 36@46s. English cheddar brings 84@94s.; Wiltshire double, 70@80s.; Cheshire medium, 60@70s.; fine, 76@80s.; Scotch, 70@76s. Dutch cheese—Edams, 74s. ⅘ cwt.

Fine butter is not to be had, and more is doing in Irish and American and secondary Continental.

Cloumels, 150s.; Corks, 144s.; Dorsets, 168s.; Normandy, 120@160s.; Swedish, 160s.; American and Canadian, 90@120s., ⅘ cwt.

Oleomargarine or artificial butter brings 90@110s. ⅘ cwt.

The European market, it will be seen from the above report, has a favorable look for the American export trade, and the prospects seem good for an advance in prices on all sorts of cheese.

LIVE STOCK MARKETS.

NEW YORK, Feb. 5, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.

BEEVES.—On last Monday forenoon trade in horned cattle was firm, but not active. The quality of the herds on sale ranged from poor to choice, being generally coarse. Prices were 8¼@13¾c. ⅘ lb.; weights, 5¾@9¾ cwt. Wednesday trade dull at 8¾@12¾c. ⅘ lb.; weights, 5@11½ cwt. Thursday, sales slow, at 8@13c. ⅘ lb.; weights, 4@9 cwt. Friday, the markets closed weak at 9@12¾c. ⅘ lb; weights, 5@8¾ cwt. Spanish herds were not quoted. Native steers sold at 8½@12¾c. ⅘ lb.; grades do. at 12@14¾c. ⅘ lb. Dry cows and poor quality heifers at 7¾@9c. ⅘ lb. Oxen at 9@13c. ⅘ lb. Bulls, on live weight, at 4¾@5¾c. ⅘ lb. From 58@58 lbs., net, has been allowed to the cwt. The quality of the herds, as above quoted, has been generally coarse, extreme range poor to choice.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13¾	12 @13¾
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	7¾@ 9¾	8 @ 9¾
Gen. selling rates	10 @11	10 @11¾

MILCH COWS.—Trade fair in fair quality cows; some sold at $35@100 ⅘ head, calves included. Extreme range of prices, $30@125 ⅘ head. Twenty-three cows sold at $55@75 ⅘ head; 10 do. at $60@79.50 ⅘ head; 3 do. at $95@1.25 ⅘ head; 3 do. at $35@45 ⅘ head.

VEALS AND CALVES.—Smooth quality veals scarce and in demand at 9@11¼c. ⅘ lb. Grass calves, quality being very poor, slow of sale at 4@4¾c. Meal-fed calves in moderate demand at 5@8c., quality coarse.

SHEEP AND LAMBS.—Monday last trade in sheep improved on a moderate run of fair quality sheep, with choice top prices at 5¾@7¾c., lambs, 7¾c. Wednesday, no improvement in trade; sheep sold at 5@7¾c.; lambs not quoted. Thursday, sales at 5¾@8¾c.; lambs, 8c. Friday, the markets closed weak at 5@7c. for sheep; lambs not on sale. State sheep sold at 5¾@7¾c.; Canada, 7¾c.; Michigan, 5¾@6¾c.; Virginia, 5¾@6c.; Missouri, 5¾@6¾c.; Illinois, 4¾@6¾c.; Ohio, 4¾@7¾c.; State lambs, 7@8c.; Pennsylvania, 6¾c. being calls.

HOGS.—Monday last live hogs sold at $8@8.6¾c. ⅘ cwt.; Wednesday, 8¾c. ⅘ lb.; Thursday and Friday same rate. Monday, city dressed sold at 9¾@10c. ⅘ lb.—trade moderate. Wednesday, prices at 9¾@10¾c. Pigs, 1c. ⅘ lb. lower—10¾c. Thursday and Friday trade slow at 9¾@10¾c.; general sales, 9¾@10¾c.

HORSE MARKET.—City trade slow except on roadsters with fair trotting action, several head of which sold at $275@450 ⅘ head; 8 pairs family carriage do. $300@500 ⅘ pair. Heavy draft horses of good quality in brisk demand but scarce—3 pairs sold at $500@700 ⅘ pair. No change in values of poor and ordinary quality light harness horses since our last quotations. Forty-three horses arrived ⅘ Erie Railroad, via Oak Cliff Station.

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Trempealeau* (Wis.) *Republican.*

PERSONAL ITEMS.

PIUS IX. has nominated 22 new bishops

EX-GOV. FENTON is still staying in Florida.

WINSLOW, the forger, went abroad as "John Clifton."

ANTHONY TROLLOPE'S writing hours are from 5 to 9 A. M.

PROF. PATTON has retired from the editorship of the Interior.

B. P. SHILLABER (Mrs. Partington) will shortly visit San Francisco.

GEN. SHERMAN will perhaps make another visit to Europe next Summer.

EX-GOV. B. GRATZ BROWN has resumed the practice of the law in St. Louis.

MR. MOODY arrived in Jacksonville, Fla., recently, accompanied by his family.

J. M. SMITH has been elected President of the Cortland County Agricultural Society.

MRS. KENT of Wythe County, Va., recently distributed $2,100 among her former slaves.

F. A. PECKHAM, a well-known artist, died suddenly at Newport on the night of Jan. 31.

WALT WHITMAN read Schiller's "Diver" in Philadelphia, recently, for the benefit of the poor.

CARL SCHURZ and Reverdy Johnson are members of the advisory committee of the Free Trade Club.

MR. DEAK, the Hungarian statesman, was buried February 3d, at Buda Pesth, at the expense of the nation.

THE late Mr. Ralston's residence near San Francisco is now occupied by Budd Doble, the horse trainer.

THE last niece of Gen. John Stark, the Revolutionary hero, died recently at Dover, N. H., at the age of 92.

IT is said that Prof. John Tyndall will shortly marry the daughter of the Right Hon. Lord Claud Hamilton.

J. B. GOUGH has been lying seriously ill for several days, at the house of Dr. J. H. Helmer, at Lockport, N. Y.

GEN. JOHN JAY KNOX of Knoxport, Oneida Co., N. Y., died at his late residence on the night of Jan. 31st, aged 84.

MR. and MRS. LEWIS SMITH celebrated their sixty-seventh wedding anniversary at Mechanicsville, N. Y., last week.

A LIFE of Hans Christian Andersen is being prepared by Miss Wood, the translator of "The Dead Cities of the Zuyder Zee."

PROF. NORTHROP will decide upon the merits of the productions of those who wish to speak at the next Yale commencement.

THE late Theodore Parker's society in Boston are talking of inviting the Rev. Moncure D. Conway to become their pastor.

NEWS comes from London of the death of the Rev. Jabez Burns, D. D., a well-known Baptist Minister and author, aged 70.

F. REGAMEY has distinguished himself in Boston by a remarkable likeness in colored crayons of Henry Wadsworth Longfellow.

GEN. BANKS came forward as a pacificator in the amnesty debate, but, as might have been expected, pleased neither party.

RALPH WALDO EMERSON has accepted an invitation to address the literary societies of the University of Virginia on the 29th of June.

THE Rev. Dr. Charles C. Keys died on the 1st inst. at his late residence, in this city, of Bright's disease, after an illness of two months.

THE statue of Lord Palmerston in Palace Yard, near the Parliament House, Westminster, was unveiled Feb. 2. There was no ceremony.

ON the Sunday that the Prince of Wales spent in Lucknow, he went to church in the morning and to an elephant show in the afternoon.

LIEUT. CAMERON traveled on foot 2,953 miles from Zanzibar to Benguela, trusting to mere accident for his livelihood as he went along.

THE health of Father Tom Burke of Dublin, the well-known pulpit orator, which has been seriously impaired recently, is now much improved.

PROF. COIT TYLER, of Michigan University, has recently finished a work on American literature which will be published some time next season.

MRS. POLLY JEROME of New London, is the next coming Centennial woman; ninety-eight years old now, and exactly ninety-eight descendants.

THE Hon. John V. L. Pruyn of Albany, is said to own one of the finest collections of Oriental chinas, porcelains and works of art in the country.

MR. ROBERT DALE OWEN will soon give a public reading of "Enoch Arden," in Marquette, Mich., where he is now staying at the house of his son.

MR. MURRAY, missionary in China, uses Melville Bell's "visible speech" alphabet to teach Chinese their own language, with great degree of success.

A GENTLEMAN of Lynchburg, Va., owns a set of chessmen neatly molded in lead from bullets picked up on the battle-field near Appomattox Court house.

THE famous Singer will case has been decided in favor of Mrs Isabella Singer, the woman mentioned as his rightful widow, the application of Mrs. Foster being denied.

MR. H. PEASE of Darlington, England, has offered £50 for the best essay on juvenile smoking. The Rev. Dr. Ritchie, author of "The Workman's Pipe," is to be one of the judges.

A GENTLEMAN of Castleton has in his possession the dinner bell which used to call Horace Greeley to his meals when he was learning the printer's trade at Poultney, Vt. It will be placed among the relics at the Centennial.

AN INDUCEMENT!

A Good Way to Secure a Practical and Scientific Library.

WE have made a selection from our Publications of the following Standard Works, which we offer to subscribers in conjunction with the RURAL NEW-YORKER, at the extremely low rates below. These works are by men who have a national reputation in their various specialties, and we feel sure that we are conferring a double service when we offer the best Agricultural and Family Journal, *and* a Valuable Book, at little more than the cost of either alone.

We will send one year (postage prepaid on both) the

Rural N.-Y. and Willard's Dairy Husbandry, for		$5 00
"	Randall's Practical Shepherd	4 00
"	Allen's American Cattle	4 00
"	People's Practical Poultry Book	3 50
"	Quinn's Money in the Garden	3 50
"	Willard's Practical Butter Book	3 00

THE PEOPLE'S

PRACTICAL POULTRY BOOK.

A Work on the Breeding, Rearing, Care and General Management of Poultry.

THIS is one of the finest bottom-up works on the subject on which it treats, for its size and price, of any publication of the kind in this country. It is nicely and profusely Illustrated, and printed and bound in extra style. Contains 224 large octavo pages. Sent, by mail, post-paid, for $1.50. Address D. D. T. MOORE, Publisher, 78 Duane St., New York.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

Address MOORE'S RURAL NEW YORKER, 78 Duane St., New York

MOORE'S RURAL NEW-YORKER is one of the best agricultural and family newspapers published, and for many years has been an established favorite. It has a most competent corps of writers, and while matters of agricultural interest receive especial attention, the literary and news departments are not neglected. The conducting editor and publisher, D. D. T. MOORE, assures his patrons that his paper for 1876 will present even greater attractions than before, and he is sure to fulfill his promise.—*Penn Yan Express.*

NEWS CONDENSER.

— Manufacturers of sleighs have the blues.

— Ice-cutting on the Hudson began last week.

— Michigan pays its Governor only $1,000 a year.

— Poughkeepsie, N. Y., wants a new ferry route.

— America produces 1,000,000 paper collars a day.

— Farmington, Missouri, is to have a woolen mill.

— Rhode Island has 1,415,734 spindles against 814,534 in 1860.

— Gas has been reduced to $2.50 per thousand feet in Chicago.

— The National debt was reduced $1,599,000 during January.

— The Marietta, Ga., mine is found to have superior magnetic iron.

— A strike of engineers on the Boston and Maine road is feared.

— The Legislature of Kansas gives $25,000 outright to the Centennial.

— The Bank of West Troy, N. Y., is to reduce its capital stock to $100,000.

— The Seattle (W. T.) coal mines furnished 8,000 tons of coal during December.

— The Spring City Stove Works of West Chester, Pa., have resumed operations.

— There are 81,320 flour mills in Russia, driven by wind, water, treadle or steam.

— The annual importation of eggs into England now reaches the value of £2,500,000.

— A lead mine is said to have been discovered near Conklingville, Saratoga County.

— The reward of $10 offered for the arrest of "Boss" Tweed is published in Germany.

— The eight-oared race between Harvard and Yale will be rowed at Springfield, June 30.

— Twenty thousand volumes have been stolen from the Mercantile Library of San Francisco.

— The State Homeopathic Society at Albany resolved to ask for a law upon mortuary reports.

— The non-taxpayers of Mississippi already represent nearly one-fourth of all the property in the State.

— The Portuguese Chamber of Peers has voted the abolition of slavery in St. Thomas and Gulf of Guinea.

— The New Hampshire State election takes place in March, and the prohibitionists are already at work.

— Some Californians who own 160,000 acres of land are enclosing it with a single fence 100 miles in length.

— The decrease in coals used for domestic purposes in London was 400,802 tons last year as compared with 1874.

— Many Spanish families exposed to the contests between the Alfonists and the Carlists are taking refuge in France.

— The Montana Temperance people are at work for a law to close the liquor saloons Sundays and election days.

— The sale of manufactured articles from the workshops of the Worcester Free Academy last year yielded $20,000.

— The Legislature of Minnesota has passed a bill to borrow $50,000 from the school fund to pay its current expenses.

— Fifteen of the Whisky Ring in Indianapolis were sentenced to prison for terms of from six months to three years.

— The Pennsylvania Coal Company has stopped mining in the Pittston locality. Other companies are expected to stop soon.

— A bill to prohibit the use of free railroad passes by Judges and Legislators has been rejected in the Kentucky Legislature.

— A new chain and chain cable manufacturing establishment is expected to go into operation in a short time in Pittsburgh, Pa.

— There are fewer distilleries now running in any of the large corn-raising counties of Central Kentucky than in any past year.

— The destruction of the scale shop of Fairbanks & Co., at St. Johnsbury, Vt., by fire, will not interfere with the prosecution of work.

— It is stated that large quantities of baled hay have recently been shipped from Richfield Springs station, N. Y., at ten dollars per ton.

— A girl in Medina, Ohio, has a head just the size of Daniel Webster's, or three inches larger in circumferance than the average of men.

— The stringency with which the adulteration of food act is enforced in London has caused a large number of failures in the milk trade.

— Thirty new papers made their appearance during the seven days ending January 29. There were 11 suspensions during the same period.

— In the British Official Army List for December are the names of about 160 soldiers who have died in the service, leaving unclaimed property.

— It is proposed to establish in Bombay, a branch of the Young Women's Christian Association. The Woman's Movement extends even into British India.

— Plans for the proposed County Asylum and work house at Troy, N. Y., have been completed. The building is to be three stories and basement high, built of brick, 170 feet long and 30 feet wide.

— There is much discussion in Colorado over a bill introduced in the lower House of the Legislature, fixing the legal rate of interest at ten per cent. when no contract is made, and prohibiting any interest higher than twelve per cent. under penalty of forfeiture of the money loaned.

Sewing Machines.

"GENERAL FAVORITE"

No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

Wit and Humor.

SPARKS AND SPLINTERS.

A NOT-ABLE PHRASE—"I can't."

BARBERS are well informed on combing events.

KING ALFONSO'S song—"I wish mamma were here."

"MY bark is on the polar wave," said the maiden with a cold.

HE who complains of the shortness of life will get satisfaction in eternity.

"MY dear sir," is the way to commence telling a man that his bill is too high.

WHAT blossom, deprived of one of its letters, is oftenest sent by lovers?—(P)ink.

IF Tweed has not evaporated, he seems effectually to have resolved himself into adieu.

WHAT flowers speak the sweetest words to friends and the bitterest to enemies?—Tu-lips.

BUT few men can handle a hot lamp chimney and say there's no place like home at the same time.

WHAT blossom deprived of one of its letters, becomes what all young misses desire to possess? A (c)lover.

"SMIFKINS, why do you allow your boy to chew tobacco? Smifkins—"'Cause I choose to." (chews too),

"OLD-MAN-AFRAID-OF-HIS-WIVES" is the name by which Brigham Young is known among the Indians.

IN the crop of a Troy turkey a button from a policeman's coat was found, but none of the force is missing.

"I WANT you either to hit me or stop making such a blamed racket," said a thief at whom a Detroit policeman was shooting.

OHIO tramps have got so particular that they want sweet cake and preserves and they hate to rise early and eat with the family.

MEN who eat the most cranberries have the most moral courage, says a New York doctor. What per cent. is he promised on the sales!

"THAT," said the tramp, "is the top buckwheat; it has been used to keep the others warm; and I don't eat no coverlets." So he laid it one side.

A GENTLEMAN rode up to a public-house in the country, and asked, "who is the master of this house?" "I am, Sir," replied the landlord; "my wife has been dead about three weeks."

OF course a woman doesn't want her plants to freeze, but still one can't blame a man for raising a row when he hops out of bed in the morning and finds a geranium plant in each trowsers leg.

HARRY, after looking on while his new little sister cried at being washed and dressed the other day, turned away saying. "If she screamed like that in Heaven I don't wonder they sent her off."

A NEGRO boy was driving a mule in Jamaica, when the suddenly stopped and refused to budge. "Won't go eh?" said the boy. "Feel grand, do you? I suppose you forget your fadder was a jackass.'

A GIRL with three arms is attracting attention at Tescelo, near Jalapa, Mexico; and when that girl gets two arms around her husband's neck she still has one to flirt with the other fellow across the street.

SCENE in the cars:—A candy boy passing through a car meets a cross old gentleman, and says, "Pop corn! pop corn!" "Hain't got any teeth," angrily replies the man. "Gum drops? gum drops!" calls the boy.

A MILWAUKEE man made three unsuccessful attempts to blow his brains out, and then his wife told him; "Don't try it again, John; you haven't got any." He goes about now saying he owes his life to that woman.

A BAKER at Binghamton, New York, sent two barrels of crackers to the President, and for several months expected to be called to the cabinet. He then discovered that the crackers had been sold to a negro in default of freight charges.

NINETEEN years ago a father refused to let his young daughter go to a candy-pull, and she disappeared. The other day she returned, lifted eleven children out of the wagon, and entered the house as coolly as if she hadn't been gone a day.

A YOUNG lady in Lawrence, Kan., dropped her handkerchief in the street last Saturday, and it blew close to the dangerous end of a mule. The young man who picked it up will not send her his photo for a few days, as he doesn't look well with his chin under his ear.

A GENTLEMAN once called on the late Mr. Astor to solicit a donation for a charitable purpose. He gave $5. "Why, Mr. Astor," said the solicitor, "how is it you give so little? Your son John Jacob gave us $100." "Well," replied the old man, "He could afford it. He has a rich father and I haven't."

"A LITTLE MORE OF IT."

Lady.—What Two Nice Little Girls! Are you Twins? *Little Girls (both together).*—No, Ma'am, we are Sisters.

The following Catalogues are annually published, and will be mailed to all applicants on receipt of price affixed.

Bliss's Illustrated Seed Catalogue and Amateur's Guide to the Flower and Kitchen Garden.—200 pages, including several hundred finely executed engravings and a **beautifully colored lithograph. 35 cts.** An edition elegantly bound in cloth, $1.

Bliss's Gardener's Almanac and Abridged Catalogue.—122 pages. Embraces a monthly calendar of operations, and a price list of all the leading **Garden, Field and Flower Seeds**, with directions for their culture. **10 cts.**

Bliss's Illustrated Potato Catalogue contains a descriptive list of all the new varieties, with many other desirable sorts; also much useful information upon their cultivation. 24 pages. **10 cts.**

WILLARD'S PRACTICAL
Butter Book
ONLY COSTS $1,

And should be in the hands of every Farmer's wife in this country. It is full of practical and scientific information upon every branch of butter making, from the care of cows to butter in the market, and should be kept for constant reference in every house where that article is made.

☞ ***This book is fully and handsomely Illustrated.***

Every one can understand it, and improve the quality and quantity of their butter by reference to its pages. Written by one who has not only made a life study of the subject, but who is himself a

Practical Dairyman,

it cannot but be thorough and useful. No book contains more solid information upon the subject in so few words. A complete index enables he reader to refer to any branch of butter making, and take in the whole subject in a very short time.

Lay it beside your churn, and apply its useful lessons each day, and your one dollar book will have yielded you fifty dollars before the end of the year.

Sent, post-paid, upon receipt of $1.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Rural Architecture.

A CHEAP SUBURBAN COTTAGE.

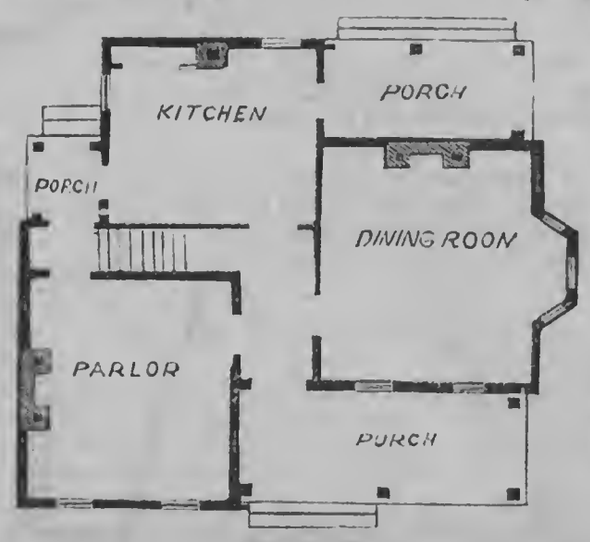
In the RURAL of the 22d ultimo we gave a plan and description of a Suburban Cottage costing $4,000 to $5,000, and promised to present our readers, during the year, with designs for country and suburban residences of different styles and prices. Our desire is to give such a variety of plans that those proposing to build can either find designs adapted to their taste and means, or such hints and suggestions as will enable them to greatly facilitate the labor and expense usually attending the construction of a residence.

With the above expressed wish in view we this week present a design for a neat and cheap cottage, suitable for either a suburban lot or small country place. The first floor plan shows the parlor, dining-room and kitchen, with main hall through the center, and side hall with stairs leading to the second floor. The dining-room has a neat bay window at the side. The entrance veranda in front adds much to the appearance and attractiveness of the house, especially when adorned with climbing vines. The second floor plan gives us three chambers, with two closets over the hall. The very desirable feature about this house is *ventilation*—a matter sadly neglected in the erection of houses and buildings. The attic can be finished into three apartments, thus giving a cottage of nine rooms, exclusive of halls and closets.

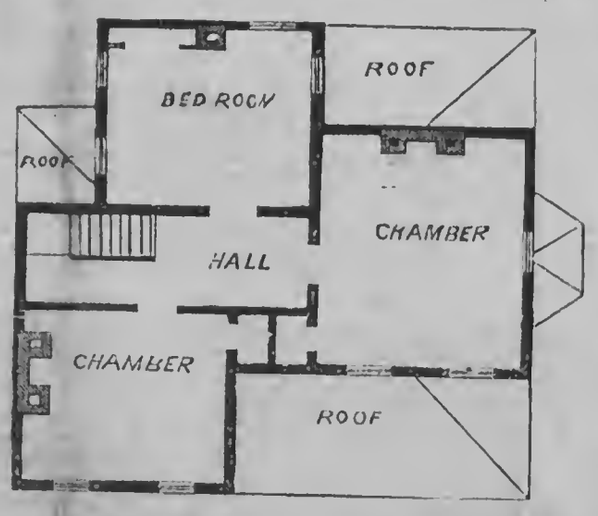
The building is intended to be built of wood, but brick could be used. If constructed in a *plain* manner, it could be done for $2,000 in many localities, but could be made to cost $3,000 or $3,500. The great difference in the cost of material in many parts of the country renders it very difficult to give exact figures. Our object in the publication of these plans is more to popularize architecture and suggest ideas to those about to build than to go into details,—as every builder (and many other persons) can take the plans as we give them and make an estimate approximating the exact cost.

If built on a large lot, surrounded with walks and shrubbery, it would present an exceedingly handsome appearance, and make a pleasant, home-like abode.

The rooms are all of a comfortable size. On first floor:—Parlor, 14x15; dining-room, 14x16; kitchen, 14x12 Second floor:—Room over parlor,



FIRST FLOOR.



SECOND FLOOR.

14x12: over dining-room, 14x16; over kitchen, 14x12. The scale of elevations is 1-12 per foot; of the floor plans, 1-16.

USE NARROW BOARDS FOR FLOORING.

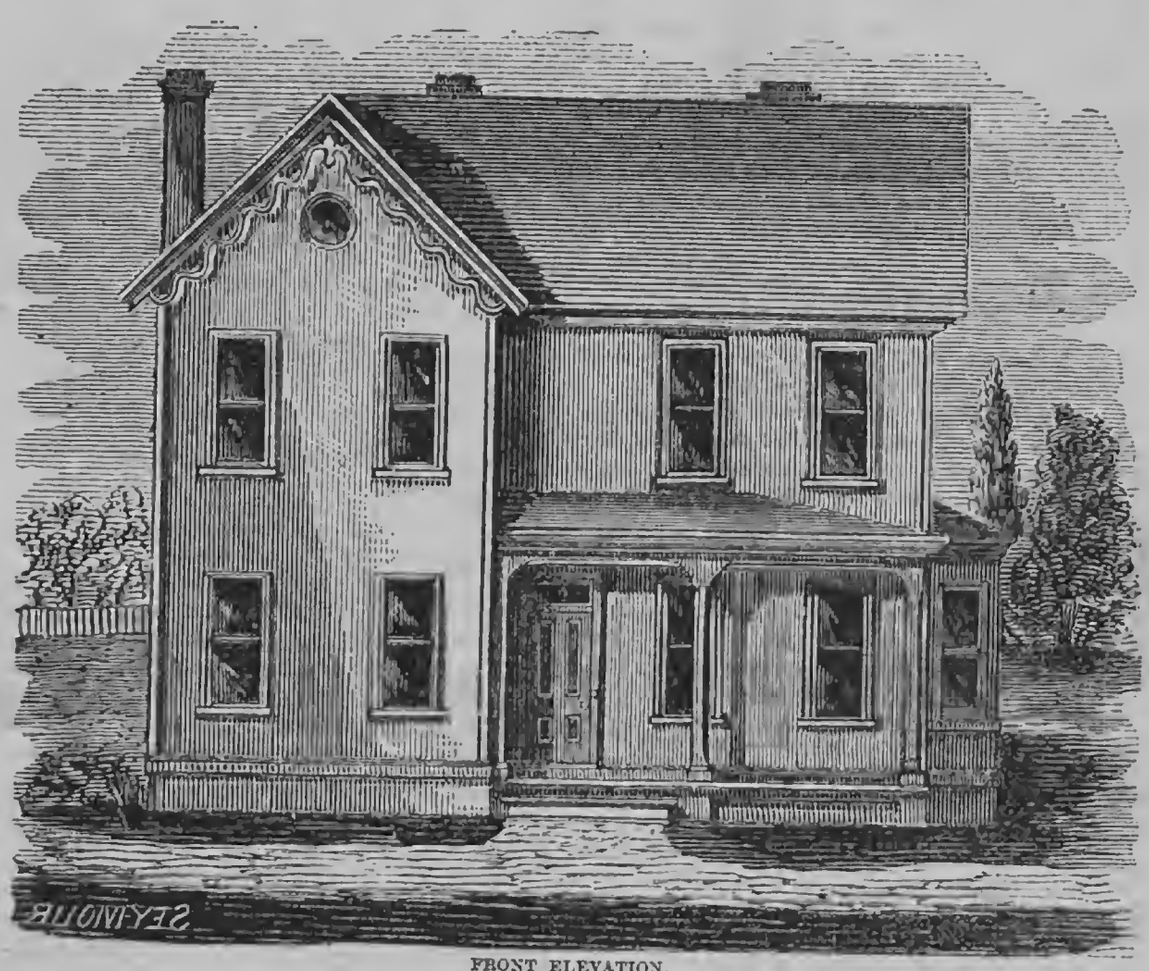
The Practical Farmer has these sensible remarks on an always timely topic:—A great many builders are not able to assign a philosophical reason why narrow boards are better for a floor than wide ones. If lumber were so thoroughly seasoned that the board would not shrink on one side nor swell on the other, wide boards would be more desirable, for a floor of any sort, than narrow ones, for the reason that a joiner will fit and lay a board one foot wide about as quickly as he can fit and lay a board four inches wide. More than this, when the edges of the floor boards are matched, there will be more waste if the pieces are narrow than if they are wide.

When floor boards are a foot in width, the upper side is liable to contract more than the under side. This is particularly the case when the floor is wet for a short time and afterward is allowed to become dry. When the under side of a floor is exposed to the dampness of a cellar, or to the moisture of the ground beneath it, wide boards will warp and render the surface of the floor more or less corrugated. But if the boards are narrow, although the under side may swell as much as if they were wide, the surface of the floor will be much more even and true. Hence, wainscoting should be narrow. When certain pieces of furniture are being made of a wide board or broad plank, it will be better to dress out pieces only a few inches wide, heat them thoroughly in a stove-room, then joint the edges and glue them together.

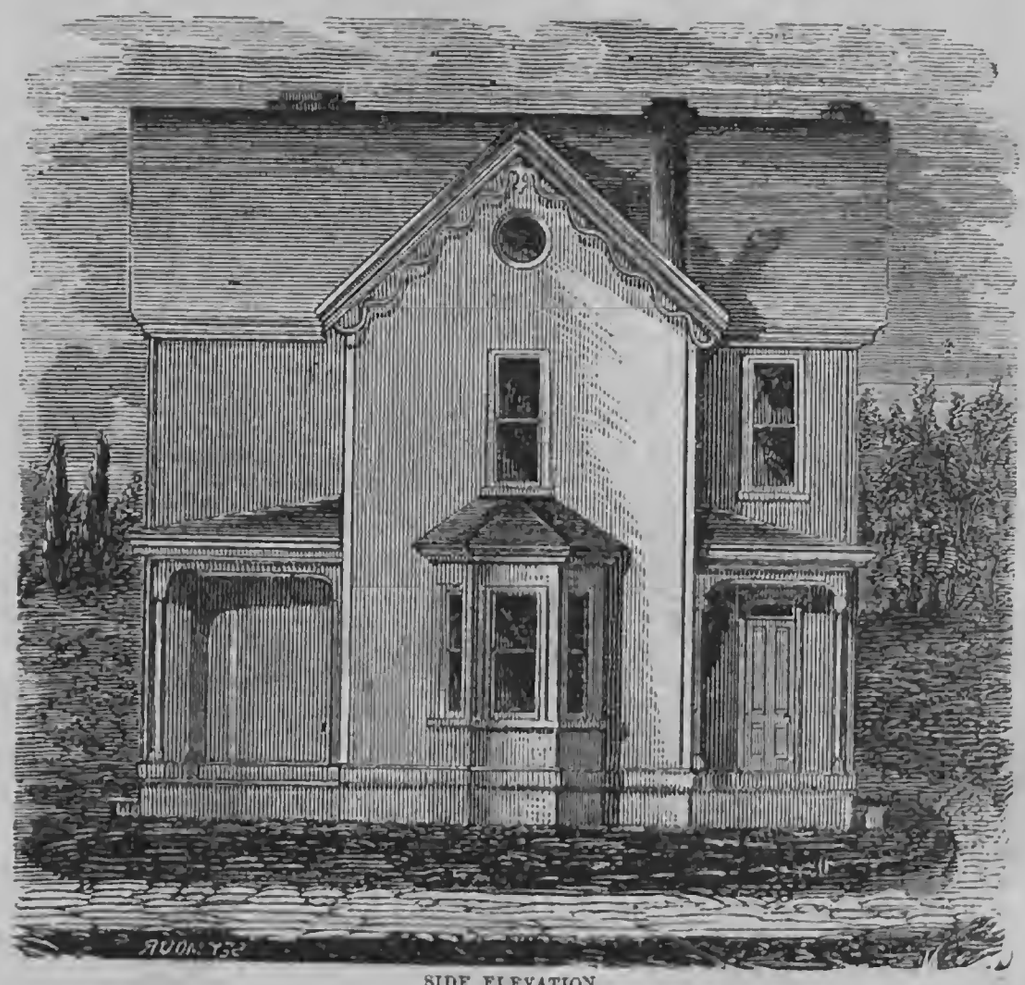
In many instances, one has numerous pieces of black walnut lumber, butternut, or other valuable timber, which might be glued together and thus make a more desirable wide board than one entire piece. The beds of billiard tables are all dressed out in pieces of plank only three or four inches wide and glued together firmly. The correct way to make a neat and true drawing-board or drawing-table is to dress out narrow pieces of plank, heat them for ten days in a stove-room, then joint the edges true and glue them together. When the edges of two boards are united with hot glue and pressed tightly together for a few hours, the timber will yield on either side of the joint before the glue will allow the pieces to separate. Glue is stronger than most kinds of timber. [These suggestions are offered for the benefit of all interested in erecting or repairing buildings.]

CONVENIENT HOUSES.

Many a fine house is made a mere shell of, because it is not built with reference to the convenience of those who are to occupy it. We think when a man proposes to build a dwelling a woman somehow should have a hand in it, for she alone can tell just where she wants this closet, that store-room, etc. A kitchen is better if it is built in an L, with two doors opening outside, so that the odors of cooking may not pass into the main body of the house. Besides, a better circulation is afforded the heat of summer. It makes work very hard for a woman when there are steps to go up or down between the kitchen and the dining-room. A short hall or lobby is not objectionable between the two rooms, as that can be occupied by a chest of drawers or two or three shelves, which always "come handy" in a house. The kitchen should be provided with two closets, a sink, cistern-pump, and always have a painted floor. Bedrooms are healthy up-stairs; but with a one-story house this cannot be. And in any event, the sleeping-room of the mistress of the house should be on the ground floor, opening into the living-room, with a large closet in it; the bedroom to be large and well-ventilated. Of course, the parlors, etc., should be designed according to taste of builders, but these general hints are thrown out for the benefit of those who contemplate erecting a substantial, sensible house, which shall be a home as well.



FRONT ELEVATION.



SIDE ELEVATION.

DESIGN FOR A CHEAP SUBURBAN COTTAGE.

Farm Economy.

RAISE ROOTS FOR CATTLE.

WHOEVER in midwinter has observed the eagerness of a row of cattle partaking of their daily allowance of beets, has been impressed with the naturalness of this food for these animals. In experimenting the writer has often induced his cattle to leave cut pumpkins, soft corn and corn meal to show their preference for cut beets. Winters when his cattle have had a good supply of roots, they have come out in the spring in good condition and apparently much healthier than when fed grain. Warmly stabled milch cows fed liberally with beets keep up a flow of milk in winter nearly equal in amount to the grass-fed cows in June, and butter made from their milk in January is as good as when made from the grass-fed cows in June.

Careful experiment has shown that 3½ tons of best roots contain, in nutriment, an amount equal to one ton of the best timothy hay. An acre of the best meadow land, under proper tilth, will produce four tons of hay. An acre of land that will produce this amount of hay, if properly cultivated, will yield 60 tons of beets—2,000 bushels. The difference in the care, cultivation and gathering of the crops will be about $70. The beet crop costing that much more per acre than the hay, but we get twenty times, in quantity, more beets than hay, while the hay is only three and a half times more valuable—saying nothing of the extra health-giving and milk-producing qualities of the beets. The maximum yield of both crops is here taken, but the proportion will hold good when smaller quantities are produced, except on swampy grass land not suitable for beet crops.

On the Earl of Warwick's sewage farm, mangolds were grown in 1874, on a twenty acre lot, at the rate of 3,670 bushels—more than 90 tons to the acre. Mr. R. GIBSON, near New York Mills, has grown mangolds at the rate of 2,000 bushels to the acre. The writer has grown Imperial sugar beets at the same rate, and hopes some time to grow 4,000 bushels of these roots on a single acre of ground. Last year, on good land with ordinary cultivation—except irrigation—he raised wagon loads of these beets, any five of which would weigh a bushel of 60 lbs. The rows were 30 inches apart, and the roots 12 to 18 inches in the row. On this plot beets grow at the rate of 2,000 bushels to the acre. Place the rows 18 inches apart—the roots one foot distant in the rows—and you will have 29,040 roots on an acre, which, at an average weight of 10 lb. each, would produce 4,860 bushels. If a given space of ground will produce a certain sized root, another equal space will produce the same, everything being equal. The average weight of Carter's Warden Globe Mangold is 18 lbs., and it grows well on shallow soils. Set the rows and plants the distances apart above mentioned—which is far enough to admit a free circulation of air to prevent crowding—and we have some idea of the enormous crop of these roots that can be grown on an acre. Of course this mode of growing them would prevent cultivating with the horse. The hoe has to be used, anyway, and if the rows are twice the distance apart, to admit of successfully using the horse cultivator, you will make a difference of nearly 1,000 bushels on the acre of ground, to which the extra cost of hoeing without the help of the cultivator is not to be compared. When the rows are but 18 inches apart two hoeings will generally answer—the leaves of the beets spread over the ground and smother the third crop of weeds. The best land should be taken for the plot of beets, and should be put in the best possible shape.

It costs no more to cultivate an acre of land yielding 8,000 bushels than it does the same quantity of land which produces but 300 bushels. To get uniformity of distance in the rows, a hand marker—like an ordinary horse corn marker in shape—should be made, into which drag teeth should be set 18 inches apart. A tightly-drawn twine can be followed in getting the first rows straight. If one has no seed drill, or if he wishes to get the plants in the rows more uniformly than a seed drill will place them, he can set the drag teeth one foot apart in the beam of the marker and cross mark the plot, then two or three seeds can be dropped in the corner of each square and be covered with a hoe. If the seeds are soaked in lukewarm water till they begin to sprout, then rolled in plaster and planted in freshly prepared ground they will get several days' start of the weeds, and, if the weeds are kept back from the start, the growth of beets will be much increased, and more than half the labor will be saved in cultivation. Spaces where plants fail to come up can be filled by transplanting. Nip off the tops and set when the ground is moist. The seeds should be planted as early in the spring as the ground can be prepared if large roots are desired—and of course careful preparation and good culture are advisable. S. A. M.

SUPERPHOSPHATE AND POTASH.

WE find the following interesting theories from Mr. D. H. THING in the Maine Farmer:—"I have used plaster thirty years on all the sward land under the plow, and shall probably do so as many years longer if I live so long. I have also used superphosphate ever since it came into this market, and have a ton for next year's operations. It has been my invariable custom to mix it with plaster on all lands where both are used. I have feared sometimes that the phosphate did not have so good an effect from this mixing, but know no reason why it should not. I have learned, on talking with my neighbors, that some of them have had the same fear. Now, sir, please tell us poor ignoramuses whether there is any chemical or scientific reason why either should exercise a controling influence for evil upon the other. Is there danger that the plaster, from its great power of holding or absorbing ammonia, should exercise a negative influence on the phosphate? Would it be as well to sow plaster broadcast on sod land for corn where phosphate is to be used in the hill? If so, how much, if any, should the quantity of plaster be increased? If as well to sow, would it be as well to sow in the fall before the snow comes? Does plaster act directly on the crop or does it chemically affect the soil or its elements of fertility so as to make them more available for the crop? I am to plant corn next season on dry, rocky, strong soil that has been pastured twenty years; broken up last August, with no manure save plaster and phosphate, 400 pounds of the latter to the acre. I tried to get these questions answered through some of the agricultural papers last September but did not succeed."

Without assuming to give positive scientific knowledge on a subject where so little is really known, we venture a few suggestions:

1. Superphosphate of lime is, even when pure, largely composed of sulphate of lime, gypsum or common land plaster. Hence the addition of more plaster is entirely unnecessary, and by diluting the strength of the phosphate is so far injurious.

2. Freshly-made superphosphate contains a considerable amount of phosphoric acid in soluble condition ready to be absorbed by the roots of plants; but—

3. There is an unavoidable tendency of this phosphoric acid to combine with lime, in which case it is "fixed," and only slowly soluble. In fact, no phosphate or superphosphate of lime was ever got on the land in freely soluble condition, as the chemical union with lime is immediate and powerful. We judge that with pure lime (carbonate) the union is stronger and the phosphate less soluble than with sulphate of lime or gypsum.

4. This phosphate of lime is soluble in carbonic acid, always present in soils where vegetable manures are decaying. Hence, where green crops or stable manures have been plowed under the ground is full of carbonic acid, and this makes the phosphate of lime more available.

4. Soda and potash have also the effect of making phosphate of lime freely soluble. Wood ashes are far better than lime in any form to mix with superphosphates; but as wood ashes contain considerable lime, we have preferred to use—

5. Salt, or chloride of sodium; always cheap and easily obtainable, and which produces the very best effects. Having used superphosphates ten years or more, we have for the past three, mixed two or three shovelfuls of salt with each barrel of superphosphate. Our experience is that 150 lbs. of superphosphate, with 15 lbs. of salt, will give as good results on wheat or other grain as 250 lbs. of superphosphate without the salt.

6. Superphosphate with salt, gives best results on wheat, with which the land should be seeded to clover. Ashes and gypsum (plaster) can be profitably used together on the clover the second year.

OIL-CAKE FOR FEED.

AN English writer to the Millwright asks: "Why is it that so much of the linseed oil-cake produced in your country, especially in the West and North, is exported to England? It must be that its value as food for cattle, and stock of all kinds, is not known or is not appreciated by stock feeders of your country. American oil-cake commands $50 to $60 per ton in England, and, as the English are the best economists in the world, they would not pay more for oil-cake than they would for anything else if it were not the most valuable for feeding purposes, particularly when we consider the extent to which they feed for fattening. Experienced English feeders all say that their best beef is that from cattle fed on oil-cake meal, and it is universally known that the English know how to make and appreciate good beef. Oil-cake meal is equally valuable as food for horses, cows, sheep and hogs. It is the richest food known: it gives a healthy tone to the animal, fattening the lean ones, and maintaining the health and vigor of the strong. The great value of oil-cake for cattle food has long been known, yet it is by no means sufficiently appreciated in your country, nor upon the part of very many persons who own or feed stock is it clearly or fully understood."

The neglect of oil-cake by American farmers is probably explainable by the fact that in Indian corn ground into meal we have a better feed than the English farmer gets in oil-meal and cake. The English farmer feeds oil-meal in connection with roots, turnips, mangolds, &c., and these require the most concentrated foods to make the combination most effective and profitable. Besides, in southern parts of this country we have cotton-seed meal, which is nearly as valuable food as oil-cake, and would be more generally in demand if it were not so abundant.

Field Crops.

WHEAT GROWING IN COLORADO.

AT a late Grange meeting in Colorado, Mr. H. STRATTON reported the following as cost and profit of growing wheat on a 15-acre field:

To 7½ days' plowing with a team at $4 per day.	$30 00
2¾ days' plowing with an ox team at $3 per day	11 25
3 days' work of horse team in going after a broadcast sower and sowing wheat	12 00
1 day's work with horse, hauling grasshopper exting ulsher	2 50
2 days' work of men tending same	3 00
cost of 5 gallons of kerosene	2 00
cost of extinguisher	7 00
cost of water at $1 per acre	15 00
1 day with horse team going for seed wheat.	4 00
running seed through separator	1 00
1,017 lbs. seed wheat at 3c. per lb.	30 51
5 days' work irrigating at $1.50 per day	7 50
cutting 14 acres with machine	14 00
29 days' work harvesting at $1.50 per day	45 00
board for men at 75c. each per day	32 50
5¼ days' work with horses and men at $5.50 per day	30 25
threshing 990 bushels of wheat, including labor, board of men and machine bill—just 12½c. per bushel	48 63
Total cost	$256 14
Interest on 15 acres at $20 per acre at 10 per cent.	30 00
	$286 14
Contra Credit.	
By 390 bushels of wheat (23,400 lbs.) at 3c. per lb.	$702 00
20 tons (estimated) good, bright straw at $4 per ton	80 00
Total credits	$782 00
Less total debits	$286 14

Cost of production per acre, $19.75; cost per bushel, 68c. Average yield in bushels per acre, 28.; average amount in dollars and cents, $50.40. Profit per acre over cost of production, not including straw, $27.62.2. Profit per bushel, $1.12.

In the above account I have calculated the wheat at 3c. per lb., which is a little above the local market; but as it is of the White Australian variety, weighing plump 60 lbs. per bushel, I shall hold it until spring for seed, when I can readily realize 3c. per lb. One acre was destroyed by grasshoppers, which is calculated in the cost of production, and of course cuts down the figures as far as profits are concerned. Wheat sowed on 1st, 2d and 3d days of April, and harvested from 10th to 20th of August.

WHEAT WITH STIFF STRAW.

ENGLISH farmers find much trouble from wheat being beaten to the ground by heavy rains before maturing. English fields are richer and the climate moister than our own, and these combined make falling down of straw much more prevalent in England than here. To offset this evil, stiff straw has become a necessity to English farmers, and the London Agricultural Gazette reports the following varieties as excellent:

Short and stiff-strawed varieties of wheat especially adapted to highly-cultivated and richly-manured lands are not uncommon. Piper's Thickset, as it was called, was many years ago a favorite sort. The Fenton white wheat is another short-strawed sort. Mr. Scholey's Square Head has got a very high reputation as a most productive short-strawed variety of white wheat of first-rate quality. And at the Smithfield Club Show the Biphosphated Manure Company exhibited Capt. Delf's Mainstay wheat, which is declared to have stood this year where all other sorts were laid."

It is probable that most of these varieties would prove tender in our severe winters. Of American varieties, the old Soules and the modern Diehl have short, stiff straw. The Clawson or Seneca has also moderately stiff straw, and is more hardy than the Diehl or any other white wheat of equal quality with which we are acquainted. As a rule, red wheats are more liable to fall down than those of white varieties, possibly partly because they are generally more hardy and grow more vigorously.

PLANTING POTATOES.

WE have taken your excellent paper six or seven years, and it seems as if we hardly could get along without it. You encourage your readers (if I understand rightly) to ask questions and you will answer them through your paper. Now, will you please tell us how many bushels of potatoes (Early Goodrich) it requires to plant an acre, how far apart the rows should be, and whether the potatoes should be cut into pieces, one eye for each piece, or planted whole? By answering these questions you will greatly oblige —A CONSTANT READER OF THE RURAL NEW-YORKER, *San Jose, Cal., Jan.* 22.

POTATOES here are usually planted in hills 3 feet apart each way. Our most successful growers cut to one, two or three eyes and one piece in the hill. Some varieties require more seed than others. The Early Goodrich hereabouts has been mostly superseded by Early Rose and other still newer varieties, Peerless, Brownell's Beauty, Eureka, Compton's Surprise, &c. We would advise trying some of these new varieties in your locality, the Early Rose Especially. One good eye of Early Rose per hill will bring a large crop. Peerless need more seed to prevent the potatoes from growing too large and coarse.

TO PREVENT POTATOES ROTTING.

SOME twenty-five years ago, when potatoes first rotted so generally in this country, I had a lot planted on low ground—a meadow bank—and also a lot planted on a high piece of ground. When I commenced to take up my potatoes I found nearly all those in the meadow rotted and those on the hill only about a third rotten. This induced me to select high-lying ground for potatoes, and instead of applying the manure in the potato row, as was almost the universal practice, I drew out and spread it on the surface any time during the winter, and when planting the potatoes in the spring I gave no attention to the manure, but plowed the ground, dropping the potatoes in every third furrow. The result was that I had very few rotten potatoes, while most of my neighbors who planted in the old way lost largely of their crops. Some varieties rotted worse than others. T. W.

The Centennial.

NOTES ABOUT THE CENTENNIAL.

THREE of the great restaurants are nearly finished. These are the American, near Agricultural Hall, the German, close by Horticultural Hall, and the Southern, in Belmont avenue, close by the Government building. The French restaurant, within a stone's throw of the Art Gallery, is going up rapidly.

THE Germantown Telegraph says that the Agricultural Building on the Centennial grounds is now nearly completed. It is located in front of Belmont Cottage, and will prove, when finished, one of the most attractive edifices in the great group. The farmers of the country may well be proud of what has been done to uphold the interests and dignity of their noble pursuit.

THE Book Publishers' Association have voted $30,000 for a display of articles in their line at the Centennial, and this department will be one of the most interesting and valuable. The Leather manufacturers and Furniture manufacturers are also preparing for a creditable show. It is also proposed to contribute to the Art Exhibition, but arrangements for this are not fully completed.

MR. JAMES BELL of Arnprior, Canada, is preparing a collection of mineralogical specimens, including gray, white and variegated marble, hematite and magnetic iron, phosphate, whetstone and bone, steotite, grit stone, shell marl, cobalt, and three kinds of mineral paint, Mr. Bell adding to this list some specimens of slate and copper. All the minerals were got within twelve miles of Arnprior.

THE old-fashioned New England farmer's home of 100 years ago is to be exhibited at the Centennial. In this will be shown the ancient kitchen with its roomy fire-place, spinning-wheel, quilting-frame, and other house-wife apurtenances, all in use as in the days when we lived under the king. Close by will be found as perfect a modern New England kitchen as it is possible to build.

AT Middletown, N. Y., there is a great ox which will be sent to the Centennial Exhibition. He was five years old on the 28th of May last, and weighs 5,000 pounds. He measures 25 feet from tip of tail to tip of nose, and is 22 hands high. His sire and dam were both imported from England, and were representatives of a celebrated English breed. He is not fat, and if in high flesh he would weigh, it is estimated, 6,000 pounds. The owner of the animal has been offered $5,000 for a quarter interest in him.

Here is a Centennial contrast. First as "Poor Richard" had it in 1776:

"Farmers at the plow,
Wife milking the cow,
Daughter spinning yarn,
Son thrashing in the barn,
All happy to a charm."

And now for the modern improvement in 1876:

"Farmers go to see a show,
Daughter at the piano,
Madame gaily dressed in satin,
All the boys learning Latin,
With a mortgage on the farm."

GROWING OF NURSERY STOCK IN THE U. S.—The increased attention paid to fruit and ornamental tree growing is probably best indicated by the growth of the nursery business. A writer in the Patron's Helper of Iowa suggests that a record be made by all nurserymen and placed on file with the Centennial Commissioners, giving statement of number of acres in nursery, the amount of glass houses used, and the yearly prodnction of fruit or ornamental trees, vines, flowers and vegetables. Such a record, with the names of firms contributing it, would prove a valuable statement of the progress of our people in horticultural pursuits.

Dairy Husbandry.

THE SKIMMED MILK QUESTION AT THE WEST.

At the recent Convention of Illinois Dairymen the practice of making skimmed milk cheese was strongly condemned and the following resolutions unanimously passed: "That the making of skimmed and partly skimmed milk into cheese is detrimental to the dairy business. It tempts and facilitates cheating, makes it practicable for the dishonest to sell as good, an inferior article of cheese, and thus impose upon the consumer. This impairs confidence in all cheese manufactured in the region where skimmed milk cheese is made; damages its reputation, diminishes its consumption, decreases its salability, depresses its market price, and results in the end in loss to the milk producers and cheese manufacturers. Therefore, it is the judgment of this Convention that the best interests of the dairy business of this State demand that making skimmed cheese be discontinued and that full cream cheese only be made."

The second resolution is as follows:—"That we petition our Legislature to pass a law requiring manufacturers to brand all cheese made, so as to indicate whether skimmed, partly skimmed or full cream—brand to be on bandage and with indelible ink. Also the name of the maker."

These resolutions are all proper enough, and they doubtless represent the views of whole-milk cheese makers in other States beside Illinois. But we doubt whether they will have any influence in stopping the make of skimmed cheese, since persons are not wanting who will continue to make such cheese so long as it proves profitable.

The second resolution will be of little or no value to consumers should it become a law, because it does not go far enough. It does not put any restrictions upon shippers or dealers in cheese. They are at liberty to deface the marks and brands made by the manufacturer and then sell the cheese for what they choose to call it. The practice of erasing marks on boxes of cheese is quite common with some dealers both at home and abroad, and would not all marks on the bandage be likely to be removed whenever it was the interest of those parties to erase the same. Again, how would such a law reach manufacturers who manufactured from whole-milk and worked out the cream during the process of making as effectually as if the milk had been skimmed. But there is a way of breaking up the practice of making cheese from skimmed milk. If dealers would agree not to handle such cheese at any price, leaving it on the maker's hands, we apprehend a deathblow must be given to the practice. A law compelling makers to brand skimmed cheese, may be useful to dealers who are not able to tell the difference between a whole-milk cheese and one partly skimmed, but so long as they are not restrained from selling according to the brand, the law would only be a cunning device to help certain dealers.

It is sometimes said by shippers and cheese buyers that our skim cheese manufacturers will ruin the reputation of American cheese in foreign markets and especially in the English market. Granting that this be true, some explanation is needed why the Dutch skimmed cheese sells in England often for quite as much as the "fancy cheese" from our best whole-milk factories. Thus for instance, on the 13th of December, 1875, extra fine American is quoted in London at 65s. to 66s. sterling per cwt., while Edams—a Dutch skimmed cheese—is quoted at 70s. per cwt., or 4s. above best American.

We are not sure but it would be a good thing for our skim cheese manufacture if all the States should pass a law requiring all cheese to be branded and sold for what it is. In that case perhaps the skim cheese men would so improve their product that it would outsell that made at whole-milk factories.

A NEW BUTTER WORKER.

There was a new butter worker on exhibition at the New York State Dairymen's Convention at Norwich that differs so much from those in general use as to merit notice. The bedpiece on which the butter is placed is 3½ feet long by two feet wide, slightly inclined so that the buttermilk will readily pass off. It stands upon legs, and a corrugated roller is so arranged that by turning a crank it traverses the whole length of the bedpiece pressing the buttermilk out and leaving the upper surface of the butter notched. The corrugated roller does not touch the bedpiece, and hence the butter is not ground against the two surfaces. By reversing the crank the butter is rolled up into a roll and may then be again flattened out with a notched surface, as in the first operation. The corrugated roller has eight corrugations about ¾ths of an inch deep and 1¼ apart at the surface or extremities of the corrugations. Springs are arranged at either end of the roll so that it yields more or less to the butter as it moves over it. The principle involved in its operation is to press the buttermilk out in a way similar to that of the ladle when used by hand. From the testimony of butter makers who were present at the Convention, and who had used this machine during the past season, and it was recommended as doing its work with rapidity and without injury to the grain of the butter. The machine was shown by G. W. Cunningham of Chenango, whom we understood also to be the inventor.

JUDGING THE QUALITY OF BUTTER.

Those who have been placed on committees for judging butter at fairs or other exhibitions where dairy products are shown, have often felt a difficulty in discriminating properly between the different samples. A correspondent of the Country Gentleman proposes a scale of points to meet cases of this kind, the points also to be observed by dairymen in making and dealers in buying butter. He suggests 10 points of excellence on a scale of 100 points for perfection, no one scale to exceed 10 points. Thus, for instance, a sample having the following would lack perfection by 24 points.

1.	Texture or solidity has	8
2.	Color	9
3.	Flavor enriched by feed of cows	7
4.	Quality and quantity of salt	8
5.	Freeness from streaks	6
6.	do. flecks or white specks	8
7.	Freeness from rancidity	7
8.	do. artificial coloring	6
9.	do. buttermilk	9
10.	do. taints	8
Making in all		76

or 24 points lacking for perfection.

At the recent Dairymen's Convention at Norwich, when the committee on dairy products were appointed we suggested that the exhibitors be made the judges. The work of the committee was to take samples of butter from the different packages and place them on plates with appropriate numbers corresponding with the packages and then give the samples to the judges. On this plan the judges are not able to distinguish their own butter, and when the award is made the committee, on referring to the number, can readily tell the package, and the exhibitors themselves, being the judges and agreeing on the awards, can have no cause to complain or make charges that any outside influence has been brought to bear on the judges in making their awards. The plan works well, and we commend it to the attention of Fair Committees.

BUTTER MAKING.

In the Rural New-Yorker of Nov. 20, page 331, is an article entitled "Something New in Butter Making." After carefully reading it, it occurred to me to experiment a little and see how much milk it would take to make a pound of butter. I am milking but two cows at this time, and they have been in milk for one year, and one is now farrow. They are fed on nothing but hay and corn stalks, and are a mixture of Short-Horn and Jersey. They are not in a full flow of milk at this time. The milk is set in tin pans to the depth of 1½ inch; milk is strained into the pans at time of milking and set away. At night the morning's milk is set upon hot water and heated, but not to the boiling point, and is then set away till next morning when it is skimmed. The night's milk is treated in the same manner. The milk is allowed to stand 24 hours before skimming. We have practiced this way with our milk for a number of years, thinking we make more and better butter, and have no trouble to make good butter in warm weather.

My figures are these:—13 lbs. and 13 oz. of milk made 1 lb. and 1 oz. of butter. Mr. Hardin should have made the same amount of butter by his process from about 11 lbs. of milk, according to his statement. But I think it must take more pounds of milk to make a pound of butter on grass than when cows are in the barn and fed on hay and stalks; and better still, if they can have some kind of a mess as meal provender and such like, with some roots.

Hampshire Co., Mass. L. P. Wolcott.

THE DAIRY IN ILLINOIS.

According to Dr. Joseph Tefft of Elgin, there are 200 cheese factories in Illinois. Elgin, which is situated about 40 miles in a northerly direction from Chicago, is the center of a flourishing dairy section, and at Elgin there is a Dairy Board of Trade, at which large transactions in dairy produce are made from week to week. The sales of dairy goods during the past season at this market were of cheese, 3,983,206 pounds and of butter 225,175 pounds, amounting in the aggregate to $540,399.15. There is a condensed milk factory at Elgin, and large shipments of fresh milk are made also from this point to Chicago. The number of milch cows in Illinois is put at 2,000,000. This, we should say, is too high an estimate, as the last census gave the number at 850,340, and it hardly seems possible that this number has been more than doubled during the last five years.

The Horseman.

THE CALIFORNIA TROTTING HORSE.

Some of the best trotting horses of recent time have been reared in California. Mr. A. T. Dinsdan, in the Stockton Independent, advocates the claims of California as the best climate for breeding horses. Some reasons for which opinion we quote:

The fibrous material of the muscle of the California horse is of a finer and better quality than that of the horses of any other country I ever saw, because of the peculiar dry feed, an analogy may be sought in the best cured tea; there is not that amount of water drawn into the system. Hence the fine, elastic fiber of the flesh is a prominent feature in their miraculous endurance. Superior to either their symmetrical framework, their fine, elastic fibrous muscles, or their rapid motion, is their large breathing apparatus. The result of pure air, well cured hay and straw without dust, mold or rust. The machinery of a horse may be as perfect as that of a well arranged locomotive, with powerful lungs and a larnyx well developed, but without a large, well developed nasal channel and open, leafy-like nostril, all the other perfect qualities will avail him nothing, no more than a large furnace and boiler in the locomotive without draft.

Both classes of the progeny of horses imported (if the term will apply to those brought from the sister States as it does from foreign countries) are similarly affected by climate, food and education, their motion becomes more rapid, in fact this happens to both man and beast. This rapid motion, whether native or acquired, is destined to place them in a much more noticeable position when better understood than even the great feat of Occident has done. Had old Hambletonian been bred to as many choice mustang mares as he has been to others, however select and well bred, he would have produced more and faster trotters in the aggregate than he has done. No single family has shown equal merit with Bruno and Brunette, and their dam, the little Canadian mare, would not compare favorably with select mustangs, so that we think that California breeders have a nucleus in their native horse that, were they in Kentucky, increased speed would be the result. The infusion of Pilot blood would be superseded by the more rapid motion of the mustang.

Of Occident himself the same writer says:—Occident, considering his age and advantages—having but one cross—has placed himself as the representative California trotting horse, not only at the head of the United States, but of the world. Contrast the number of horses in California with that of the other States and the world, as only in this way can a judicious comparison be made, and it will be fully one thousand to one. Occident's education contrasts strangely with the sons of science, in the breeding and handling of horses. He learned the alphabet of work in a dirt wagon, his jogging exercise in an excavation cart and his scrapes and speeding exercise in a poultry wagon. Mrs. —— told me that many a struggle she witnessed in company with the owner and his wife, with fast nags and light vehicles—Occident always being victorious. Goldsmith Maid, Occident, Smuggler and Red Cloud grew up as rustics, until five years old, and I might add Flora Temple, Lady Thorn and Dexter, who, from their turbulent spirits, refused to do much more than contend until after that age.

BREAKING COLTS.

In the Rural of Jan. 1, "Working Farmer" gave some ideas on breaking colts to which we propose to enter protest by your leave:

"Working Farmer" holds that the correct system is to let the colt run till three years old, then catch him (if you can) and teach him every thing the first day. He thinks the time spent toying with and teaching the colt to lead while it is with its mother as lost. We are aware that it is not practical to have colts broken to halter and gentled so as to be caught in the field, etc., where large numbers are raised; but the large majority of our horses are bred by small farmers who raise from one to four each year, and we know by experience that this gentleing process is practical.

"Working Farmer" gives an instance of his success in breaking his stallion, of trotting stock, and by the way we would much rather handle a stallion colt that had never been handled, than a filly or a gelding, from the fact they have less fear and better horse sense than geldings and fillys generally.

As an offset to "Working Farmer's" example, I will give one and not an uncommon one. A neighbor of ours who is breeding trotting stock quite extensively, had his favorite filly ruin herself when hitched with a strong rope halter for the first time. She had never been handled and was wild and strong, and when compelled to stand when tied, she struggled and threw herself and injured her neck and back, and has never recovered. Her owner has his colts all broke to lead and stand tied as soon as weaned now. Again, we object to the amount of work given the first day. We would prefer not to load the colt the first day; in fact if we hoped to make a trotter of him I would prefer to never pull him hard. Ohio Boy.

Harlem Springs, Ohio.

MORGAN HORSES.

At a meeting of the Vermont Board of Agriculture, held at Ludlow, Albert Chapman read a paper on the breed of horses for Vermont, full of interest. A long and interesting discussion followed upon the several points presented. He said that the reason why Vermont horses have stood so high was because they have been so well bred. The Morgan horses have given the State a reputation, and is the race which should be brought forward again for service, while they possess qualities of speed equal to any which have been introduced to public notice since their day. They will endure more service than the thoroughbred. The cross of the Morgan with the Canadian horse was considered next. The latter were animals of great hardiness. From an early age he inherits the lot of toil so that whatever commanded to do, he must perform or die, and it is a singular fact that Canadian horses do not appreciate gentleness or kindness.

The pacing horse in a cross was next considered in making good trotters, while the Morgans make horses of style, action and build, and also make good animals for all work on the farm, carriage and driving horses; they also make good trotters. A large proportion of them when properly crossed prove fast; at any rate good crosses always produce good roadsters. The past record of the speed of the Morgan horses was given, and several striking instances cited proving that several of the fastest horses this country has produced were of this breed. More blame attached to Vermont, for the decline of this breed, than to any other section by accepting the statements that other breeds were the speediest, which the record does not sustain in fact. The best produced, and those bringing the highest prices, were those bred from larger sized dams and smaller sires. He concluded by reading a record prepared by him of the speed and sales of Morgan horses as compared with other breeds. None failed to learn from Chapman's earnest and positive manner that he was an able advocate of Morgan horses.

STABLE FLOORS.

The Germantown Telegraph says:—The long-debated question as to the best material for stable floors, is being revived. A clay floor was held out for years, and such was the earnestness of its advocates and the many arguments brought to bear upon it, that we were induced some fifteen to twenty years ago to try it. In three or four months we had the planks back again, being severely satisfied of the disadvantages of clay for horses. Our present floor of plank is simply inclined a little from front to rear, where the usual gutter is made to carry off the liquid voidings. We do not believe in sand, coal ashes, sawdust, asphaltum, flags, cobblestones, or any of these modern devices to injure horses. Thus far we have never noticed that this little inclination was in any way injurious; and we doubt whether the wooden grating placed over the planking would be advisable on the ground that the animal would be no more comfortable, while this movable grating or second floor might lead to accidents. When a person can keep horses in good, sound, healthy condition for from five to seven years, as we have done on a carefully-constructed plank flooring, inclining a little to the rear, it is just as well to be satisfied with it.

CARE OF HORSES.

The London Horse Book says:—All horses must not be fed on the same proportion, without regard to their ages, their constitution and their work; because the impropriety of such a practice is self evident. Yet it is constantly done, and is the basis of disease of every kind.

Never use bad hay on account of cheapness, because there is no proper nourishment in it.

Damaged corn is exceeding injurious, because it brings on inflammation of the bowels and skin disease. Chaff is better for old horses than hay, because they can chew and digest it better.

When a horse is worked hard its food should be chiefly oats; if not worked hard its food should chiefly be hay, because oats supply more nourishment and flesh-making material than any other kind of food; hay not so much.

Rack feeding is wasteful. The better plan is to feed with chopped hay, from a manger, because the food is not then thrown out, and is more easily chewed and digested.

Sprinkle the hay with water that has salt dissolved in it, because it is pleasing to the animal's taste and the hay is more easily digested. A teaspoonful of salt in a bucket of water is sufficient.

The Herdsman.

ENGLISH PRIZE SHORT-HORN OX.

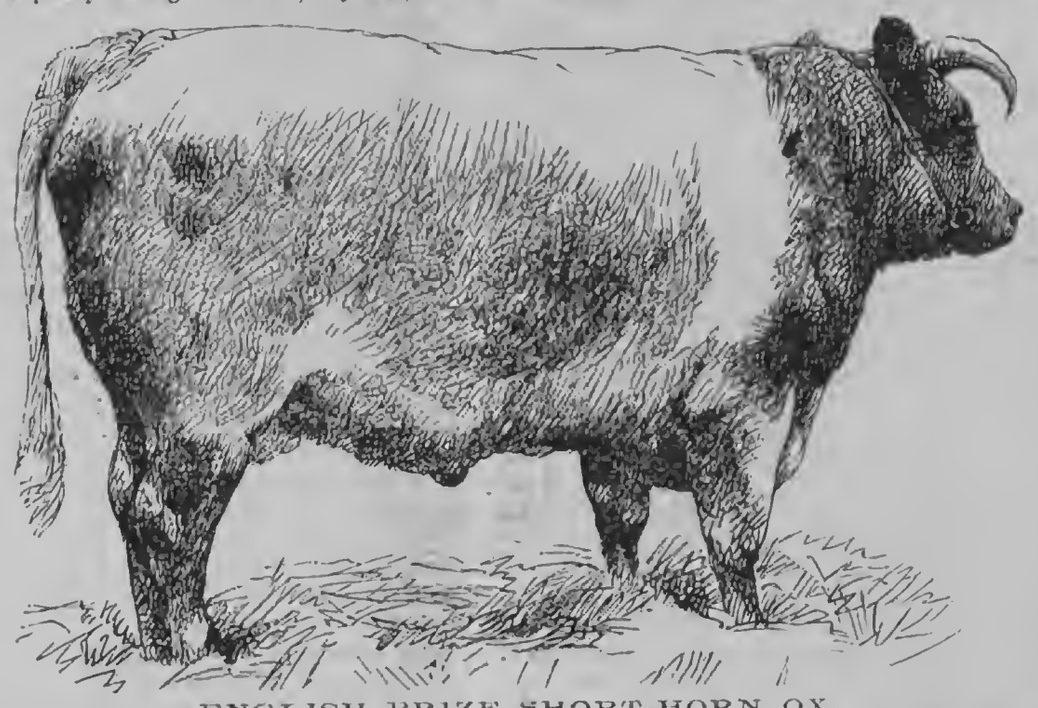
Our portrait represents a model Short-Horn Ox which has taken prizes at several English Cattle Shows. He is thus described by a London contemporary:

In the class of older Short-Horns at Islington, over 39 months, there was a great display. Among the eight were at least two grand specimens, and two more not to be overlooked. That declared the 1st in its class, and awarded the £50 cup as best male in the classes (Mr. G. Sowerby's roan ox) is an old visitor here. In 1873 he was put 2nd to Mr. Bolt's fine roan (which was 1st. again last week in Bingly Hall). Now he gains all the credit that he can expect, for the judges reserved (as gallant judges will when they have a chance) their highest place to a most beautiful heifer. Last year Mr. Sowerby's ox weighed 20 cwt. 1 qr. 10 lbs., now he gets credit for 23 cwt. 0 qr. 2 lbs. which at four years and two months, is a great record. He handles very soft, as he has done throughout. His hind legs are somewhat weary, giving him a bad carriage behind. But he seems an admirable champion of the popular breed, and might encounter any of his own, or of a rival breed without fear. Take him all round, from his symmetrical horns to the tip of his tail, it is difficult to suggest an improvement. It is plain that he is grossly fat, but he is healthy, and by far the best-finished animal in the show.

FOR BEEF AND BUTTER.

Geo. E. Waring in the Feb. No. of Ogden Farm Papers, in the Agriculturist, disapproves the advisability in considering the adoption of a breed for dairy purposes, that the preponderating regard should be had to the value of a cow as beef, after her milking is done. This, of course, is valuable and important, but its value and importance are much less than secondary. Let us put the probalities for the yield of butter at from 200 to 225 lbs. per cow, a difference that may very easily be secured by the selection of good representatives of the best breed, or of the second best. Take the average duration of profitable milking as ten years, and we have a difference in butter products of 250 lbs. worth at 30 cents, a pound, $75. In the one case let us assume that we have a worn-out thin cow worth, (to fatten) $20, and that in the other case, we have a well-constitutioned large animal worth, (to fatten), $50; this is the true standard, in considering the worth of the cow for fattening, we have to regard the cost of feed, and care, and time. Here is a difference of $75 in the income from butter, and of only $30 in the value for making beef. I have purposely neglected the citation of large yields and fancy prices, and have presented the case in its proper agricultural bearing for most localities. It seems to me to prove very clearly that no farmer who looks to the manufacture of butter as his business, can afford to consider the beefing value of his used-up cows, as an offset for inferior butter production. Thoroughbred animals get their fancy value from fancy reasons less largely than is supposed. The butter of the Jersey, the milk of the Ayrshire, and the beef of the Short-Horn are at the bottom of the fancy prices for all of these breeds, for it is this, after all, that must be looked to for the permanent value of any race. Those who embark largely in the raising of thoroughbreds often pay amazing prices for good specimens, but they have always the fact to fall back upon, that their animals will multiply rapidly, and that a slight advantage in practical value will, with their increasing herds, soon help to make up for their large outlays. They always believe, of course, that they will find customers able to appreciate, and willing to pay, for peculiar excellence, but the whole question, in its wide bearings, finally settles itself down upon the practical agricultural advantage of the race. Short-Horns, however fine, that are deficient in the quality of continuing in their progeny the beef producing characteristics; beautiful Ayrshires, well up in all the fancy points, whose descendants will not be good milkers; and Jersey cattle of the fanciest character, whose families are poor butter makers, will always fail in the end to be highly appreciated.

It will therefore be the wisest course for any beginner in stock-breeding, who is willing to invest the necessary capital, and to give the care and attention requisite for success in thorough breeding, to select such animals as are, in the first place, best adapted for the home industry that he intends to pursue, and in the second place, to get such specimens of the breed as will win favor among those who are to be depended upon as buyers at fancy prices, but a prudent man will always regard very high prices as so much lucky addition to his income. He will not depend upon it as an element of his regular business. For example, if one can establish a herd of Jersey cows which will make an average of 250 lbs. of butter per annum, and is so situated that he can secure (net) 50 cents per lb. for his product the year round, so that he may be sure of a gross income of $125, he can afford to pay a very high price for thoroughbreds, or if he has time and patience, he may buy a smaller number of remarkably good females, at still higher prices, and build up his herd, by a few years of careful breeding. If at all well situated, he may depend on a yearly average value of, say $40, for his



ENGLISH PRIZE SHORT-HORN OX.

weaned calves of both sexes. This will pay the interest on the cost of his original stock. Then, in proportion as he is fortunate in his judgment and arrangement, and in his skill in giving to his herd a good reputation, he may increase the value of his progeny to an amount that will add a very handsome profit to a business that has already been fairly profitable and satisfactory. Referring to my own experience, although I have bought many animals for from $150 to $250 each, by far the most profitable ones have been those which have cost me several times these sums. I have already referred in these papers to a cow for which I paid $500, (when this was a much higher price than it would be now), and which has returned me, in her progeny, nearly $2,000 cash, and more than that amount in the value of animals still on hand, these increasing year by year, and giving a value to the herd that reduces the original investment to insignificance. One may buy ten cows of good quality and good pedigree for $2,500, but the same money *judiciously* invested in one bull and two cows, would probably bring a larger profit in the end.

"WEEDING OUT" IN JERSEY STOCK.

The Jerseys are so exclusively grown for milk and butter that their value depends almost wholly on their excellence in these characteristics. Size, fattening qualities and, within certain limitations, health and vigor are each subordinate to the milk and butter making tendency. Fortunately the character of the escutcheon as described by Guenon affords a fair test of the potential value of an animal for milk in advance of practical tests. Judging by this the breeder is able to save calves, both male and female, for their value as breeders for milk and in this way continue and increase the distinctive value of the breed. Mr. John R. Poyntz of Maysville, Ky., has acted upon this principle for years in breeding Jersey stock and we quote from the Ky. Live Stock Record his remarks on the theory and objects of weeding out objectionable animals. He says:

The true principles of breeding necessitate pruning the herd, therefore all female animals are endowed with a time of heat, which faculty attracts the males of their kind, and inaugurates nature's requisites to the perpetuation without deterioration. Of wild animals the process of pruning the herd is successfully accomplished by the fighting of the males unto death or banishment from the herd, leaving the most vigorous males to propagate their kind; the buffalo, elk and deer, are instanced, showing no deterioration either in form or vigor, and fairly represent nature's standard, which is perfection, matured by the true principles of breeding in line, and concentration of blood to that extent necessary to perpetuate merit.

Man, in adapting animals to his use for specific purposes, has not adhered to nature's teachings in the process; hence the limited number produced that are renowned in their sphere. This may result from the "gendering of diverse kinds" being engaged in breeding cattle for rich milk and butter making. Where merit in these particulars gives value and distinction to them, I soon learned by practice that a standard of merit was necessary to regulate my business. I was fortunate in selecting "Guenon's Treatise on the Milch Cow," have adhered to the markings discovered and interpreted by him (of my selection), to determine the question of life or death of the calves, both male and female, of the herd at the age of eight weeks. If they do not have the marks indicative of merit up to our standard of his classification, they are deemed ill-bred, and placed with the butcher for veal. In this manner the pruning process is successfully accomplished, and prevents the historic reputation of the Alderney and Jersey cattle as butter makers being tarnished in our herd by the worthless of their race, purity and blood being no guaranty of the merit of the highest order in butter making. We have practiced this mode for the past fifteen years, endeavoring to attain the point for our herd in merit where they will transmit with certainty, merit of Guenon's "class first, and first order." Upon the farm we have now fifty cows and heifers, ranging in age from seventeen years old down to weeks, and seventeen bulls from five years to three months old, all having Guenon's marks of the highest order of merit, and all bred upon the farm according to the true principles.

The Poultry Yard.

DOES IT PAY TO KEEP POULTRY?

After ten years' experience I unhesitatingly say Yes, with proper care and management. Many people think there is no profit in keeping them. If we investigate closely the fact will probably appear that these unprofitable hens have to roost in trees, under sheds, on the wagon, upon the fanning mill, or anywhere else where they can find rest for their weary feet. They have probably had to scratch all day with might and main for a few scattered grains or a scant supply of worms, and have had to run the gauntlet of boys and dogs besides.

Said a farmer to me, "I keep fifty hens and have to buy eggs, and I am fully satisfied that it does not pay." I asked, "How much grain do you feed them?" "Oh," he says, "they have the run of the barns and help themselves. I do not know how much they eat, but it is more than they are worth."

"Where do they roost?" was the next inquiry. "O, anywhere that they can be most in the way."

"Can they get drink this winter weather?" "Yes, they can eat snow."

It would not have been polite to have called this man a simpleton, but I felt like doing so. Why he had to buy eggs was apparent enough. Hens are often blamed for scratching, but well fed hens are not so very troublesome in this respect. They do much good by destroying bugs, worms, and the like. Much is said and written about sparing the robins, but I would sooner have 100 hens than 1,000 robins for the purpose of destroying insects, and are quite sure they will make less havoc among the fruit and berries. Besides, hens can be kept shut up while the robins cannot. There is nothing better to destroy squash bugs than a hen with a brood of chickens cooped near.

Visiting a strawberry grower once I found him with several boys busily engaged digging after the "grub." He complained that his plantation was half ruined by them. After sympathizing with him for awhile, I remarked that no hens appeared about his barn, which stood within a few rods. "No," he replied, "I will not keep any; they are a perfect nuisance. We had a few once and they scratched up everything." My reply was, that "If they had dug over as much ground as you and your boys have, probably your wrath would have been great."

"Why," said he, in great surprise, "we are digging out the grubs that are destroying my strawberries."

"And so were your hens." I replied, "and had you let them run on here, they would probably have destroyed the May beetle and then you would have had no trouble with this grub; the hens would have saved your crop as well as this immense amount of work."

Poultry gives a home look to one's premises. Lack of them has a chilling effect. Very much like finding a house with no children in it; a front yard with never a shrub or flower in sight, or a church service with the singing left out, not pleasant by any means.

Poultry to a wise man is useful, ornamental and profitable, and any one who does not see it in this light is deprived of a great source of happiness as well as profit. Of course it will be at times necessary to shut up the hens, but a greater part of the time they can have the run of the premises. I generally shut up my fruit in preference to shutting up the hens, and find it the most profitable. N. Ritter.

FACTS IN TURKEY BREEDING.

The American Agriculturist has these comments and quotations on turkey breeding and raising:

There is nothing like facts to confirm a theory. If it were really believed that good selection and good feed would increase the average size of turkeys a third, it would not be difficult to get intelligent farmers to pay attention to these points. We find a very important item in a local journal from North Stonington, Ct., which confirms this view. This town is on the borders of Rhode Island, and represents the district where the Narragansett turkeys are principally raised, known in the market as Rhode Island turkeys. The writer says: "Probably more than fifty thousand pounds of poultry were sent from this vicinity for the Thanksgiving market in Boston last season, at 23 cents per pound. The quality sent this year is better than that of last year, some lots of turkeys averaging nearly twelve pounds, and one monstrous old fellow bore down thirty-six and a quarter. The size of turkeys raised hereabouts has increased steadily for twenty-five or thirty years, owing to attention to propagagation. The time was when the average at Thanksgiving did not exceed eight pounds, and brought only as many cents per pound; whereas the weight has been increased fifty per cent. and the price two hundred per cent."

From Stonington, the town immediately south, a still larger quantity was sent, and the quality was a grade heavier. Said an old farmer who bought a large bronze gobbler of premium stock last season: "I must have some more of that stock, for I have the heaviest turkeys in the neighborhood." Good feed, especially during the first fall and winter, is almost as important as good stock. A farmer feeds a bushel of corn a day to a hundred turkeys in November, at the cost of a dollar, and it looks a little extravagant. But it is less than the third of a quart, and the cost of a cent a day for each bird. We once tried the experiment of feeding some second-litter turkeys through the winter, and found the hens gained about two pounds a month and the gobblers three. The feed was principally boiled potatoes, and meal and corn. At this rate, the gain in flesh, at twenty-five cents a pound, would be worth seventy-five cents a month for each gobbler, and fifty cents for each hen. If thirty cents' worth of feed will make this gain, it cannot be very bad business to feed turkeys liberally through the winter. By all means have large, well-fed stock to breed from in the spring, and the time to make them is now.

POULTRY NOTES.

Warm Food for Hens in Winter.—"A Boy" asks how he may give warm food so as to get many eggs in winter. A warm place is necessary before the warm food will be of much use. Dry food is, probably, the best for all animals exposed to the weather. If you have a warm place, then you may treat your pullets to warm food, such as warm corn pudding cooked with a little oil-meal, milk, etc. Feed once a day with dry food, such as corn, wheat, oats, barley, rye—but wheat is best. Give warm food twice per day and let there be a variety. You should also keep a trough with fine raw bone and lime in it, all the time, for the hens to eat when they choose, and they will pick at it many times a day. The warm place and warm food will give you eggs in plenty and money in your pocket, for eggs bring the highest price in winter.—*Buffalo Live Stock Journal.*

Hens in Close Quarters.—Your correspondent (C. A. Russell) I think could not have lived through the hen mania of 25 years ago, or he would go cautiously into the business of keeping five acres of hens. Try the confining of hens on a smaller scale and see how their imprisonment will pay on four acres with half the number he intends for the eight acres, as I think the experiment will be a failure. One-half the expense will do to try it.—w.

Sick Mocking Bird.—A lady friend asks what she should do with her mocking bird, which is sick and does not sing a note. Possibly moulting is the trouble, in which case the bird will recover of itself. Give it some red pepper as food, and dust sulphur on its back and neck for lice.

Around the Republic.

LETTER FROM ALABAMA.

MOBILE, Ala., Dec. 21, 1875.

EDS. RURAL NEW YORKER:—I have before me your paper of the 18th ult., and my attention has fallen upon the article headed "Down South"—the diary and notes of an ex-editor seeking health. Now, it occurs to me that there are many people who, like your Florida correspondent, would be glad to hear of some genial clime where health, pleasure and comfort may be found, where "foggy mornings" do not exist, and where there is not the "bold northeast wind," that blows into one's frame the "chills, miasma and malaria," "makes bronchial coughs lively" and "breathing difficult," from which ailings your correspondent seems to think Florida is not entirely free.

The idea has undoubtedly grown up among Northern people that Florida affords the only anchorage for the forlorn hope of the consumptive, and that there, and *only* there, gushes forth that Pierian Spring of which "*all* must taste in order that *any* may be cured."

If you will allow me, therefore, I will call the attention of your readers, whether they be seekers of health or pleasure, to a few facts as to other places in the South besides the "Land of Flowers," so named, that have already been discovered, as being far more desirable and attractive to the pleasure-seeking tourist and far more beneficial to the consumptive than even the aforesaid blessed peninsula. And I will submit incontrovertible evidence to prove that the southern portions of Alabama and Mississippi, and portions of the coasts of these States, borderings on the bays and sounds and other inlets of the Gulf, are the finest winter resorts in the United States. For in health, climate and pleasure this section of our vast country is unsurpassed. In the first place, let us look at Mobile—a beautiful city of 40,000 inhabitants—of pure water—of fine streets—of handsome drives—of abundant markets—and all health and pleasure-giving properties that can exist in a city of its size. Situated at the head of a beautiful bay of the same name—in latitude 31 degrees north—Mobile is a salubrious, dry and healthy city. It is dryer here than in Florida, for we are free from those fogs and continuous cold northeast winds of which your Florida correspondent complains. Mobile is far enough west to escape these greatest of drawbacks to Eastern Florida. For, according to Prof. M. F. MAURY, in his "Physical Geography of the Sea," these fogs, &c., which prevail on the South Atlantic coast are caused by the winds blowing from the northeast taking up their moisture in the warm atmosphere of the Gulf Stream and depositing the same upon striking the colder climate of the coast. This moisture is, therefore, deposited long before the winds pass over Mobile from the same direction, and the only wind that brings much moisture to Mobile from the Gulf Stream is the wind from the South. Hence the greatest rainfall in Mobile occurs in the summer, as is correctly shown by the report of the Chief Signal Officer at Washington for the year 1873. The rainfall at Mobile for that year, according to said report, was as follows:—For the spring months, 16.21 inches; summer, 28.97; autumn, 16.49; winter, 11.01. The summer rainfall is, therefore, much greater than that of the other seasons; and it seems a providential blessing, for it is the summer season when the rain is most needed. These summer rains, according to MAURY, are brought up by the South winds from the Gulf Stream. But these winds do not always bring rain; they frequently simply cool the air and produce a luxurious freshness in midsummer, such as I have never enjoyed anywhere else.

The mean annual temperature at the City of Mobile, according to the Weather Bureau reports, is 64 deg., the mercury rarely falling below 30 or rising above 90, showing an evenness of climate unsurpassed in the world. Mobile, besides being pre-eminently healthy, offers, together with its fine climate, other advantages which should be considered very important by all tourists contemplating winter sojourns at the South. The society is hospitable and refined, and always open to our respectable friends of the North. Its markets abound with fish, oysters, game, tropical and other fruits, and early vegetables. Consequently, its hotels are enabled to keep the best tables. Nor are the prices so high as in that "land of pure delight," as your correspondent terms it; for the best hotel here—the Battle House—equal to any in the South, charges only from $2 to $3 per day, and I dare say is equal at least to the $4 per day hotels of Florida. Mobile is easily accessible to all points by rail, and its proximity to New Orleans makes it convenient for the sojourner to visit that gay city and enjoy its social advantages and public festivities, for which New Orleans is noted, in conjunction with those of Mobile.

And now, Mr. Editor, I hope you will excuse me for writing so long a letter. But this cannot fail to be useful to all, who, like your friend BRAGDON, can get no answers to their queries about the best places in the South to go for the winter, but will go, as he went at last, and, to use his own language, "be compelled, in a great degree, to go it blind. FRANK B. CLARK.

Floricultural.

CLEMATIS IN POTS.

THE accompanying sketch from the London Journal of Horticulture may give some idea of the excellence of these vines as pot plants.

CLEMATIS IN POT.

Pinching back the young shoots as they grow too long, which forces the lower buds to break, and confines the plant within desired limits, is the only peculiarity of this form of culture.

C. Viticella erecta is a new dwarf French variety less than two feet high bearing blue flowers and well adapted to pot culture. Balloon, umbrella or oval-shaped wires, or frames of any kind according to taste or convenience, may be used as supports. Rich, light soil—well drained pots, and liberal watering are advisable.

In view of our recent article upon the Clematis, further details are unnecessary.

INTERESTING PLANTS.

Thunbergia Harrisoni.—We see this vine offered as excellent for covering trellises. It was described in RURAL of Feb. 5.

Lilium Bloomerianum.—ELLWANGER & BARRY offer this Lily. The flowers are large, nodding, orange color, dark spots—six to eight feet high, producing, under good culture, four to six stems.

Souvenir du Congres.—This Pear was illustrated and described in the RURAL of June 5. E. & B. now offer it at two and three dollars each according to size.

Dionæa muscipula.—Mr. PETER HENDERSON is among the first to offer this renowned carnivorous plant.

Eulalia Japonica—Is offered by Mr. WM. BENNET as an entirely new and very distinct grass from Japan, having graceful, reed-like stems four or five feet high, which are crowned when ripe with light masses presenting the appearance of ostrich feathers. The leaves are long and narrow, striped with white and green. Perfectly hardy.

Hibiscus fulgidus.—Mr. WM. BULL of London, describes this as having flowers five inches in diameter, composed of undulated petals of an "intense carmine, paler towards base where on each petal is an oblong blotch of deep crimson, forming a blunt-rayed star in the center of the flower." Obtained from the South Sea Islands.

Lagerstræmia Alba.—Several of our nurserymen offer the White Crape Myrtle, a seedling of the pink and hardy in the South. It may be kept in pots in the cellar during the winter.

Rubus Roezli.—A smooth-branched shrub, with palmate-lobed leaves and creamy white flowers the size of half a crown. It was discovered in Colorado by M. ROEZL. "Gartenflora."

Proteinophallus Rivieri.—Well known as *Amorphophallus Rivieri.* We have several times spoken of this interesting plant. The Botanical Magazine says:—"Like its allies it throws up an umbrella-like head of deep green foliage, borne on a cylindrical stem, two to three feet in hight. The spathe is four or five inches across and of a livid-purple color, spotted with green below, the spadix being purple, streaked with white."

Agave Victoriæ Reginæ.—The Gardeners' Chronicle thinks this the most remarkable among greenhouse plants. It comes from New Mexico—is remarkably distinct and handsome in its own peculiar grotesque way.

Clematis Alba Magna is said to be without doubt the finest of all the white blossomed varieties, the sepals being so broad that any two meet across the intervening one, and thus form a more solid looking flower than we get in the case of any other variety.

Poinsettia pulcherima plenissima, the so called double flowering *Poinsettia*—though an additional number of bracts is alone referred to by "double flowering"—is still well thought of and will probably "go the rounds."

Iris gigantea.—In French gardens there is an Iris growing 5 feet high and bearing white flowers, striped with brownish yellow near the base of the outer segments.

CORRECTION.—In my article upon "The Clematis" in the phrase—"we yet assert that the Clematis is the finest hardy plant in cultivation"—the word *plant* should have been *vine.* E. S. C.

The Garden.

ABOUT SEED DISTRIBUTION.

(To E. S. C.)—Thank you kindly for your article in the RURAL NEW-YORKER. It is one of those articles that we need more of, full of good, common sense. Your suggestions in regard to giving away seed are very good, and if the papers would offer premiums of seeds, I think they would be thoroughly appreciated.

My business takes me among the farmers, and I am surprised at their ignorance in regard to the modes of procuring seeds and the great lack of flowers among them. Not one farmer in fifty has a collection worth naming, nor do they seem to know how easily and how cheaply they can procure them. I have distributed a large number of catalogues and packages of seed, in order to show them how beautiful and cheap flower seeds are, and I am pleased to learn that the receivers of them are very much pleased and that through them a love for flowers is fostered. I am particularly fond of the Bulb family, and I make it a rule after selecting my own stock, to give away all the balance. Another point: Many of the Bulb family multiply abundantly, and ought to be sold cheaper than they are; that would tempt many to buy who do not. I hope you will favor us with other sensible articles. C. W. IDELL.

No. 144 Roade St., N. Y.

CULTIVATING HUCKLEBERRIES FOR MARKET.

(A. M. VAN AUKER.)—There are several distinct species of "huckleberry" growing wild in the Northern States, one of which is called "blueberry" in some localities. We do not know of any experiments having been made to cultivate the huckleberries for market, and therefore cannot give you any information in regard to profit. Probably the best way to get up a plantation of this fruit would be to begin with the seed, raising the plants in a nursery, transplanting them once or twice before final planting for fruiting. Of course, where there are plenty of wild plants, small specimens can be dug up and removed to the garden or field without any considerable loss, but they would not be as good or as sure to live as those raised under the usual nursery system.

The huckleberry is a good fruit for some of our enterprising young horticulturists to take up and improve by scientific manipulation. It would be well, however, for those who are inclined to enter this (at present) unoccupied field to make themselves thoroughly familiar with the different species and best wild varieties in advance.

Patrons of Husbandry.

THE GRANGE IN ENGLAND.

THE movement to inaugurate the P. of H. in England comes at a very opportune time when the mind of English farmers is exercised over the inaction of the Government on questions affecting farmers' interests.

Mr. C. S. READ, a member of the Government, and the only tenant farmer who holds a seat in Parliament, has resigned his subordinate position, where he could be of little use, and will henceforth act as an Independent Member of Parliament. Mr. READ has made almost as great a sensation as Mr. PLIMSOLL did last summer in behalf of the seamen. His position as the only representative of the large working farmer interest, as opposed to the landholders who have long controlled Lords and Commons, is a most responsible one. He is already one of the most popular men in the Kingdom, and bids fair to wield such an influence as O'CONNELL did forty years ago as representative of the Irish Peasantry. The Grange is more likely to consolidate the influence of English working farmers and working men, and will, probably, take more active part in politics in England than it has done in this country. Heretofore English farmers, excluding the landholding interest, have had less political influence than the farmers of our own country.

SUCCESSFUL CO-OPERATION.

THE Louisville Courier Journal says that a Grange co-operation store in Howard County, Indiana, started with a capital of $1,000, paid up, each Grange in the County voting directly out of its treasury $50 and electing one director. The whole business was under the direction of the Board, which selected an agent. In a little less than one year they report a business of over $30,000 and a saving of at least 30 per cent., while the whole expense has been less than 10 per cent.

This is about what can be done when a sufficient number of members become interested to create a large amount of business. But suppose the sales had been only $10,000, the expenses would have been the same, and a loss instead of a gain would have resulted. Patrons contemplating the establishment of Grange co-operative stores should think over the matter well, and in no case attempt it when from any cause any considerable part of the membership will fail to support it. One failure will do more harm than many successful ventures can do good.

HOW TO MAKE THE GRANGE ATTRACTIVE.

THE practice of Melrose Grange, Iowa, as reported in the Patron's Helper, offers a good suggestion about making the Grange attractive, which means successful, in many cases where more formal meetings would soon become tiresome. This Grange has no hall, but meets alternately at the houses of its members. The gatherings have a social character, and a simple supper is served after the meetings, *always.* Another practice is to have a question box into which any member may drop such questions as he pleases, on any topic of interest to farmers, and the master answers them or calls on some member to do so. This also is a regular custom. So the members are sure, at every meeting, of both bodily and mental aliment, of a pleasant social gathering of friends, and of profitable communion together. This Grange never fails of a quorum.

CO-OPERATION AT OBERLIN.

E. M. LEONARD writes to the N. Y. Tribune:—The following is the seventh report of the Oberlin (Ohio) Co-operative Association:

Goods invoiced at		$3,439 22
Fixtures		286 85
Cash		239 59
Total		$3,965 66
304 shares at $10, less by	$3,040 00	
Reserve fund	192 67	
Liabilities	259 86	$3,492 53
Profits		$473 13
Quarter's sales		$2,675 74

Dividend to stockholders for the quarter ending Dec. 31, 1875. 15 per cent. The dividends for the seven terms aggregate 142 per cent. We commenced business Feb. 24, 1874. Our success has been in spite of great opposition.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

A PEEP UNDER THE SNOW.

Feb. 7.—The first snowstorm of the season in this locality (Northern New Jersey) occurred three days since, snow falling to the depth of about eight inches, and the temperature dropped to about 7 deg. below zero for a few hours only. The icemen began to look happy, as well as the boys and girls, who had been "spoiling" for a sleigh-ride. But last night there came a change: the mercury took a sudden rise in the thermometer, while the rain came down quite briskly. This morning the sun shone out bright and warm, melting the snow slowly but surely, and leaving the ground almost bare again at night.

Perhaps it is only imagination on my part, but it always seems to me that the thousands of little wild and cultivated plants look brighter and more beautiful as they come peeping out from the snow than at any other time. Their leaves fairly glisten in the light as the last drop of melted snow disappears, carrying with it the impurities which may have accumulated and rested there before the great white robe fell upon them, days or months before. For one I enjoy a ramble in the woods at such a time, even while snow banks still linger in the shady nooks and ice-water trickles over moss-covered rocks, because it is then that the sturdy character, as well as beauty, of frost-proof foliage shows to the best advantage.

IN THE GARDEN

we can find much to admire at this season, in addition to the taller kinds of evergreens, like the pines, spruces and hemlocks, because those of less stature, such as the *Hollies*, *Mahonias*, *Rhododendrons*, *Kalmias* and other broad-leaved evergreen shrubs, are really more conspicuous than they will be several weeks or months hence, while still lower down in the scale, and more humble perhaps, we find the long-leaved, hardy *Yuccas* creeping up, as it were, through the melting snow. The evergreen *Daphne* (*C-cneorum*) *Saxifragas* of many species, trailing *Euonymus* and Periwinkles (*Vinca*), Honeysuckles and many similar plants finally show their green and various-colored leaves as the last patch of snow departs, giving us a foretaste of greater things to come.

IN THE WOODS

there is a similar shifting scene worthy of study, for the pleasure it gives, especially to those who have a taste, and I may add capacity, for enjoying such things. The woods in my own neighborhood are not as rich in low-growing herbaceous and shrubby evergreen plants as in some other localities, still quite a number of really handsome kinds may be discovered by a careful search. The trailing Arbutus, which is one of the most beautiful of the very early blooming shrubs, is found upon rocky or sandy hillsides, usually in deep shade. It is a difficult plant to make live when transplanted into the garden, but will thrive if placed in a similar soil and situation to those in which it is found growing wild. Two species of the *Kalmias* are plentiful, the broad-leaved (*K-latifolia*) and the narrow-leaved (*K-augustifolia*), both of which may be transplanted without much danger of the plants dying, and they thrive in almost any kind of soil, from a light sand to clay, peat or muck. The broad-leaved species which in some localities is called "Laurel," is in my opinion worthy of being placed in the very front rank of choice shrubs. There may be kinds more showy but none more beautiful, either in leaf, bud or flower.

But if we look carefully among the low undershrubs and fallen leaves, other handsome plants may be found in abundance at this season, brighter for their late cold bath in snow-water. The common evergreen ferns (*Polypodiums*) straighten up their green leaves, as much as to say "see how many chilling blasts we can withstand and still look cheerful." "Take us to your gardens and give us a shady nook and we will continue to thrive there as well as here."

Here are also great beds of Pipsissewa, or Princes-Pine, one species with dark green leaves, and another, in which they are marbled, veined or spotted. These plants prefer the shade, and a cool soil, hence, seldom thrive if exposed to the sun. Then we have the *Pyrolas* or Wintergreen Shin-Leaf, in several species, all with handsome foliage but rather an inconspicuous flower. Also, the one-flowered wintergreen (*Moneses uniflora*) with its roundish veiny leaves and large, solitary white or rose-colored flowers. The more carefully we search among the dry leaves of the forest, the greater will be our reward, and while I cannot now attempt to enumerate all the choice plants which might be found in a ramble through our northern woods, still I must not omit the *Goodyeras* and the *Mitchella repens*. The first belong to the Orchis family, the flowers are not very conspicuous or beautiful, but the leaves are exceedingly pretty, being more or less veined with white, or to use a scientific term, "white reticulated." The leaves are clustered at the roots, about two inches long by one broad. The most showy and common species are *G-pubescens* and *G-Menziesii*, both found in our northern woods, and they never look better than in early spring soon after the snow has melted away. These are excellent plants for Wardian cases or ferneries, growing quite freely under such conditions, if placed underneath plants of taller growth.

The little *Mitchella*, also known by the common names of "One-Berry," "Squaw Berry," "Partridge Berry," etc., etc., is perhaps too well-known to need a word of praise from me, still I fear that many persons who never ramble in the woods, in spring, or take a peep under the snow, know little of the beauties of this humble little plant. Its long, slender stems creep over the ground, forming dense masses of the most delicate green, while the bright scarlet fruit nestle among the leaves, like coral beads in a necklace, neither frost nor snow affecting their brilliant color. Later in the season, in place of fruit we may find a wreath of exquisite, minute white flowers, but amid all these changes the delicate little leaves remain ever green.

SOWING GRAPE SEED.

Feb. 8.—Years ago I experimented a little in raising seedling grapes but gave it up for want of encouraging success. My aim was a good white variety, equal, if not superior, to any of the native red or black sorts, but in this I failed, not in obtaining varieties of the right color, but they all lacked something in other important properties. From the Delaware, without attempting any cross fertilization, I obtained one seedling which in vine and leaf was almost an exact counterpart of its parent. The fruit, however, was in color, what is usually termed white, both berry and bunch resembling the parent in size and form, but did not equal it in quality, besides ripening nearly a month later, consequently I did not consider it worth preserving and propagating.

Having had such poor luck myself, and reading the glowing accounts of the wonderful results obtained by a dozen or more "scientific hybridizers" of the grape, I concluded to abandon the field and purchase the best varieties produced by those who were successful in getting-just-what-they-were-after-every-time. Poor deluded mortal that I was; for after waiting these dozen years or more for *the* white grape, *par excellence*, it is apparently still a long way off.

Of course I have not been idle in the way of purchasing new sorts which were highly recommended, and of the much desired shade of color. Among these noted sorts I recall to mind, the *Anna*, *Allen's Hybrid*, *Albino*, *Cassady*, *Croton*, *Cuyahoga*, *Golden Clinton*, *Lydia*, *Martha*, *Manhattan*, *Maxatawney*, *Rebecca*, *Taylor's Bullitt*, and several other later productions, which may not prove to be any more valuable, or worthless than those named.

Now, I have never asked much in this direction, for a white grape as good in every respect as the *Concord*, would be quite acceptable, but not having been able as yet to obtain such a one, I have resolved to take a hand in the seedling business again, regretting that I ever went out of it, for who knows what might have been produced during fifteen or twenty years of annual sowing of a few grape seeds. My first batch of seed in accordance with the new resolve, have been put in to-day, and as they were saved from a white variety, I shall stand a better chance of getting new sorts of that color than if they had been taken from black or red, still there is no surety of this, and I must take my chances as to results.

We are sadly in need of better pure native sorts of all colors than we now possess, but we need more than anything else, a variety which will take the place of the *Malagas* in our markets; whether we shall ever get it remains to be seen. If everybody would try, the chances of success would be proportionally increased. It is no more difficult to raise a bed of seedling grapes than a bed of parsley, but it takes a little longer time to learn the results, and this is what discourages many from trying their hand at producing new sorts.

HOW TO MAKE GOOD MUCILAGE.

The best quality of mucilage in the market is said to be made by dissolving clear glue in equal volumes of water and strong vinegar and adding one-fourth of an equal volume of alcohol and a small quantity of a solution of alum in water. The action of the vinegar, is due to the acetic acid which it contains. This prevents the gelatinizing by cooling; but the same result may be accomplished by adding a small quantity of nitric acid. Some of the preparations offered for sale are mere boiled starch, or flour, mixed with nitric acid to prevent gelatinizing. These preparations are very inferior in quality to that made from glue.

Pomological.

ADAPTATION OF VARIETIES.

We may have our likes and dislikes in fruit culture as well as in other affairs of life, but circumstances frequently control our actions and modify our aspirations. It is certainly well to aim high, though we strike very low, but true wisdom will always lead a man to seek that which it is possible to obtain instead of something beyond his reach.

No one phase of fruit culture, probably, has puzzled the masses more than the one which we term "adaptation of varieties." Soil, climate, location in regard to market, supply and demand and various other conditions, come in under this head, requiring the careful consideration of the cultivator. A man's preference may lead him to plant the Hamburg grape in a location where he could scarcely succeed with the Concord; but no one would consider him wise in permitting a desire to run counter to well known facts developed through long experience in the same field.

There has been, in times past, considerable discussion among horticulturists upon this question of adaptation of certain varieties to certain soils and climate, and, in some instances, it was of a rather acrimonious character; but we are happy to say that little of this now appears, and all of our most intelligent pomologists admit that we have few sorts equally well adapted to all kinds of soils, leaving out other conditions and circumstances. Standing upon this plane, we can readily understand how men may honestly differ in regard to the merits or value of a variety. A grape which succeeds in Maryland may be utterly worthless in New York, the season in the latter State not being long enough to insure maturity or ripening of the fruit. Then again, it appears that with grapes the better the fruit the more difficult it is to obtain, for the very best succeed in fewer localities than those which are of only second-rate quality. The Concord at present is about as high in the standard of excellence as we have been able to go, and, at the same time, preserve a constitutional vigor of vines capable of withstanding extreme variations in soils and climate. Perhaps some of the newer sorts will yet show as great possibilities of adaptation: but heretofore our delicate-flavored Delaware, Walter, Iona, Allen's, Hybrid, Croton and similar choice sorts have not met expectation except in a few circumscribed localities.

In apples, pears, peaches, plums, and other of the larger fruits, the same rule holds good in regard to adaptation, and it is only by recognizing and giving it due weight that a man can avoid severe losses. The Siberian and Russian varieties of the apple are of more value in Wisconsin and other parts of the Northwest than all the thousands of choice sorts known in milder climates, because they are especially adapted to cold latitudes. Among the small fruits, or what are usually termed berries, the influence of soil and climate is even more marked than with grapes, and the cultivator must depend mainly upon local experience in determining the value of the oldest and best known varieties as well as the new. In view of this variability of varieties in this adaptation to localities, it becomes quite important that our fruit-growers, scattered over the country, should be ever on the alert to give the results of their experience for the benefit of "whom it may concern."

Owing to the well understood influence of surrounding local circumstances upon varieties, a man does not now, as formerly, stand in fear of offending by expressing his individual opinion in regard to the value of any particular sort in his own grounds or neighborhood. He may say that the Early Harvest apple is of no value in his grounds, but this would not in the least injure its reputation in other localities. Still, there is a recognized scale or standard of excellence by which the merits of both old and new sorts are judged, consequently a man may betray his cupidity or ignorance by ignoring it altogether. For instance, if one should assert that the old Pound pear was a better variety than the Seckel, or that the Charter Oak grape was superior to the Delaware we would know that he was either very ignorant or intended to deceive. He might say with propriety that they were bigger; but "better" implies something besides size. It is only by comparison that we can come to any definite conclusion as to the value of any particular variety.

PEACHES IN COLD CLIMATES.

The growing of peaches in Northern localities has, with few exceptions, greatly decreased within the last twenty years. When the country was new, Western New York, Northern Ohio and all of Michigan had an abundance of this delicious fruit. There were few facilities for marketing, and this made the price so low as not to pay, except near cities. Then a few severe winters injured the vitality of the trees, and as few new ones were planted the fruit became almost unknown, except as imported, often in poor condition, from the Delaware and Maryland peach orchards. This failure of peaches we believe entirely needless. By selecting side hills, or localities protected by belts of timber from the severest winter winds, the trees and buds may be protected in regions where peach growing has long since been almost abandoned. One of the most successful peach growers of Western New York, Mr. D. E. Rogers of Scottsville, N. Y., plants his peach trees between rows of a young apple orchard. The apple-trees protect the peach, and even in the severe winter of 1874-5 Mr. Rogers's trees were unharmed. On a small scale peach trees may be protected by wisps of straw tied on the branches and ends of twigs. It is also a good plan, after the ground is well frozen early in winter, to mulch the trees with straw or coarse manure. This fertilizes the tree, promoting vigorous growth and health. It also serves a more valuable purpose in retarding the growth of buds in warm winter weather or early spring. A good mulch of straw, even, will keep the soil frozen till late in the spring, and correspondingly retard the development of leaf and fruit buds. Cakes of ice thrown on the ground under fruit trees and then covered thickly with straw would also answer the same purpose. The peach is one of the most delicious fruits in cultivation, and wherever it has once grown successfully a little care on the part of the cultivator will make it succeed again.

MISTAKES IN FRUIT CULTURE.

Mr. Muir, Secretary of the Missouri State Horticultural Society, does not believe in painting the details of fruit culture in such high colors. In his last report he says:

The extreme simplicity of fruit culture has been very much insisted on. In this many have been greatly misled. There is a necessity of practical education. More knowledge, more experience, more of the technical training must be had to give a chance for success. Nurserymen and propagators have been blamed for encouraging excessive planting, but to a degree that is a mistake.

When a farm is well adapted to labor-saving implements, producing good crops of staple articles not liable to early decay in transportation to market, keep them producing such crops. But where land is broken, not adapted to the usual farm crops, and still capable of producing fine fruits, then, duty, economy, necessity, will indicate that fruit culture is not an extremity, and too risky on untested conditions.

A necessity exists for the thorough review of the lists of varieties, with reference to the changed conditions of culture and transportation. Dependence must mainly rest on varieties originated at home, or South, for staple fruits, and not, as has hitherto been the case, on those originated East and North.

Illustrations can be found in the Northern Spy, Rhode Island Greening, How's Crab, Roxbury Russet, and a host of others, losing their qualities, becoming fall instead of winter fruits, and in the decay of the tree or rotting of the fruit.

"UTAH HYBRID" CHERRIES.

Eds. Rural New-Yorker:—Tree peddlers have been selling in this vicinity "Utah Hybrid Cherry Trees." They represent it to be a cross between a cherry and a plum, that the fruit is nice and desirable, and the tree ornamental. If you will inform us through your columns what the "U. H. Cherry" is, in respect to its desirability, you will confer a favor, I think, upon many.—Inquirer.

The Utah Hybrid Cherry is a fraud, as, generally speaking, are all "new" fruits introduced by tree peddlers and sold as something wonderful—"unlike anything ever seen before!" Buy of men who deal in fruits that other growers know something about, and be sure that you get standard varieties true to name. Many a man thinks that his first onset in fruit-growing will astonish old pomologists with new varieties which their life-long experience and study have left them in ignorance of. To expect this is, of course, very foolish, and a little thought would show that it is impossible. Yet there are thousands who allow themselves to be imposed upon by the idea.

POMOLOGICAL NOTES.

Flemish Beauty.—The London Garden notes that at the great Pomological Meeting at Chicago this pear was found in the largest number of collections, and was most frequently marked for special praise by the Committee. This indicates a very wide area for the cultivation of that favorite kind. While it has faults in many districts, yet its hardiness and its prolific and early-bearing qualities are so well proved that it finds great favor everwhere.

Figs.—Ellwanger & Barry say that Figs may be grown as bushes in the garden, in the Northern States, if they are taken up annually, the first week in November, with a ball of earth attached to their roots, and placed in a cellar till about the middle of May, when they should be taken out and replanted. Most all of them ripen in August.

Domestic Economy.

MENDING TIN-WARE.

FAITH ROCHESTER, in the November Agriculturist, describes a method of soldering which we have long used, and can recommend it to all your readers. It is essentially as follows:—Get an ounce of muriatic acid, put it into an old teacup or bowl, and throw in a few small pieces of zinc, such as you can pick up at any tinner's. After it has ceased to effervesce, turn into a bottle and use a small stick to apply the liquid to the tin. Scrape the tin clean and bright around the place to be mended, rub some of the liquid on with the stick, lay on a piece of solder, and hold it over a lighted candle till it melts, and the job is done.

We use a small soldering iron, and much prefer it to the candle plan. A soldering iron can be had for twenty-five cents that will answer every purpose; ten cents worth of solder will last a year in an ordinary family, and the muriatic acid will not cost any more. What a tinner or traveling tinker would charge for a single job of mending will buy a complete outfit, and then you are done with the annoyance of leaking vessels, or being compelled to work without them, at a great disadvantage. With farmers who live some distance from town, the soldering outfit is one of the greatest conveniences—with us it is indispensable. We keep the iron, solder and fluid (the latter well corked except when in use) in a box by themselves, on a shelf out of the reach of children. The muriatic acid is a very powerful corrosive agent, and must be handled with extreme care. Children must not be permitted to get hold of it. Several years ago we bought a bottle of soldering fluid of a man who was traveling around selling it—at fifty cents per bottle. Not long afterwards we got hold of the above recipe for making precisely the same thing—at a cost of ten cents, instead of fifty.

BED AND BEDROOMS.

NEVER use anything but light blankets as a covering for the sick. The heavy, impervious cotton counterpane is bad, for the reason that it keeps in the exhalations from the pores of the sick person, while the blanket allows them to pass through. Weak persons are invariably distressed by a great weight of bed clothes, which often prevents their getting any sound sleep whatever. It is better to sleep in a cool room and dress in one that is well warmed, than the opposite. If it is necessary to heat the bedroom, let it be by means of an open grate fire, rather than by a register or flue.

In view of the fact that most people pass one-third of the twenty-four hours in bed, the importance of having only the best bedding needs no argument. There is no wisdom, therefore, in buying cheap or second class articles for the sleeping room, but true prudence directs to get the very best bedding that your means will command; a first-class hair mattress will outlast two of inferior quality. The same difference will also be found in respect to feathers, and with the latter as with hair, the best is always cheapest. Too many young housekeepers neglect to follow this rule, and pursue a penny-wise and pound-foolish policy, when they might just as well have adopted the opposite practice.

SELECTED RECIPES.

Rice Omelet.—One teacup boiled, one do. sweet milk, three eggs well beaten, tablespoonful butter, bake to a light brown. Too much cooking spoils it.

Champagne Cider.—Let the cider ferment until palatable, then put an ounce of sulphite of lime to every four gallons of cider. Mix it well, and let it stand until clear, then it is fit to use.

Sponge Cake.—Four eggs beaten separately, to the yelks add one cup of sugar, beat well, and then the whites, lastly add one cup of flour, put lightly in with spoon, not beaten, bake moderately quick.

Ginger Snaps.—One pint of molasses, one cup of butter or lard, one tablespoonful of ginger and cloves each, one tablespoonful of cayenne pepper; flour enough to roll out very thin. Bake on flat tins.

Orange Cordial.—Fill an air-tight jar with orange peel, then pour on it some good whisky. After keeping it for several weeks make a sirup, and add the whisky to suit the taste. It makes a delicious cordial.

Egg Kisses.—Beat the whites of four eggs, then put in gradually a pound of pulverized sugar, season with a spoonful of extract of lemon. Drop small quantities in letter paper, and bake in a quick oven.

Mock Goose.—Take two tender steaks, lay one in the bottom of the baking pan and cover it over with lard or butter; sprinkle over this bread crumbs, well seasoned with salt, pepper, sage and a little onion. Lay on the other steak and prepare it as the first, then pour on a tumbler of water, and bake slowly, keep it covered until nearly done.

Sauce for Pudding.—One-half cup of butter; one-half cup of sugar; beat these together with one heaping tablespoonful of flour. Pour into it (a little at a time, stirring all the while) one pint of boiling water, and let it simmer on the stove a few minutes. Add one teaspoonful of lemon extract, and the juice of one lemon or teaspoonful of lemon sugar.

Cooking Potatoes.—Many persons in preparing potatoes for cooking pare off a thick slice from the surface instead of digging out the eyes. The skinning process is all wrong, as the strength of the vegetable lies near the surface—the starch growing less abundant as the center is approximated. The best way is to scour them well, and either bake or boil them with their skins on.

Shorts Pudding.—Take four eggs well beaten, a pint of milk, and make a thin batter with the shorts. When boiling corned beef, dip in your pudding-bag and fill with the above. Have plenty of room in the kettle with the beef, and be sure the water is boiling; put in the pudding and let it boil two hours without letting it stop. Eat with sweetened cream or any other pudding sauce.

Pickling Beef.—To pickle beef for long keeping; First, thoroughly rub salt into it and let it remain in bulk for twenty-four hours to draw off the blood. Second, take up, letting it drain, and pack as desired. Third, have ready a pickle prepared as follows: For 100 pounds of beef use seven pounds of salt, saltpetre, and cayenne pepper, of each one ounce; molasses, one quart; and soft water, eight gallons; boil and skim well, and when cold, pour it over the beef.

Hygienic Information.

KEEP THE FEET WARM.

THE Herald of Health gives these seasonable hints and suggestions:

Never go to bed with cold feet. Never try to sleep without being perfectly certain that you will be able to keep them warm. To lie one night with cold feet gives such a strain to the system as will be felt seriously, perhaps ending in a fit of sickness.

Cold feet show an unbalanced circulation. The very best thing to do is to warm them by exercise, if that be practicable. If not, try dipping them in hot and cold water alternately two or three times, and then using vigorous friction. If that does not warm them and keep them warm, heat them before the fire, dry them thoroughly, and then correct your habits or improve your health; for be sure that one or the other is wrong, perhaps both.

With all the rest, if you sleep on a hard bed, with cotton sheets, in a cold room, put on an extra covering over the feet. It is very convenient to have a "foot comfort," just wide enough to cover the top of the bed and about a yard deep. This may be made of some light material (perhaps the remains of some pretty dress), filled with cotton, like a "comfortable," and tacked with some harmonious color. During the day this may be thrown over the foot-board, and spread over the bed at night. The advantage of this is to secure light covering for the feet without overburdening the remainder of the body.

If you use a hot brick or hot iron, put it in the bed a little beforehand, and then when retiring remove it. To sleep with the feet in contact with it has a tendency to make the feet tender.

But better than both these, and to be used with or without them, is the foot blanket. This may be a square yard of domestic flannel, or two yards folded of Swiss flannel, or anything else you like that is warm enough, only have it nice and clean. Fold this around your feet and ankles before you put them down into the bed. If not very cold, this will often warm them, especially if you have used friction; and if warm, it will prevent their becoming cold by contact with the cold sheets. It keeps the warm air around them. It does not make the feet tender, and it is far more convenient than the hot brick or soapstone. Try it, and if you are troubled with cold feet you will be likely to keep it by you hereafter. Whatever you use, always be at full length. To "curl up" hinders free circulation.

DRINKING WATER.

DR. HALL is opposed to the immoderate drinking of water. He says:—The longer one puts off drinking water in the morning, especially in the summer, the less he will require during the day; if much is drank during the forenoon, the thirst often increases and a very unpleasant fullness is observed, in addition to a metallic taste in the mouth.

The less a man drinks the better for him, beyond a moderate amount. The more water a man drinks the more strength he has to expend in getting rid of it, for all the fluid taken into the system must be carried out; and there is but little nourishment in water, tea, coffee, beer and the like; more strength is expended in carrying them out of the system than they impart to it. The more a man drinks the more he must perspire, either by lungs or through the skin; the more he perspires the more carbon is taken from the system; but this carbon is necessary for nutrition, hence the less a man is nourished the less strength he has. Drinking water largely diminishes the strength in two ways and yet many are under the impression that the more water swallowed the more thoroughly is the system "washed out." Thus the less we drink at meals, the better for us. If the amount were limited to a single cup of hot tea or hot milk and water at each meal, an immeasurable good would result to all. Many persons have fallen into the practice of drinking several glasses of cold water, or several cups of hot tea or coffee, at meals, out of mere habit; all such will be greatly benefited by breaking it up at once; it may be very well to drink a little at each meal, and, perhaps it will be found that in all cases it is much better to take a single cup of hot tea at each meal than a glass of cold water, however pure.

DIPHTHERIA.

DIPHTHERIA (says a medical writer) is a term derived from the Greek, signifying a skin or membrane. It is an epidemic sore throat of great severity, often contagious, due to poisoning of the blood, attended with much prostration, and characterized by the exudation of false membranes and lymph on the tonsils and adjacent parts. It attacks all classes of persons at all ages. Children are most liable to contract it. It is probably most fatal to the poor, or such as reside in damp situations and in badly drained houses. So far as known local treatment does not afford much benefit unless commenced in the early stage of the disease. Inhalation may then be of value; but the main reliance must be placed in the good nursing, hygiene of the sick room, and a supporting treatment, to enable Nature to work her wondrous cures. There is no specific remedy for the ailment.

The Apiarian.

REQUISITES IN A GOOD HIVE.

REV. J. W. SHEARER is writing a valuable series of articles in the Bee-Keepers' Magazine, discussing bees and the best methods of providing for them. His statement of the requisites for a good bee-hive is an excellent one, and we condense from his list of essentials as follows:

I. Movable combs. These are absolutely necessary to an intelligent management of bees. The movable comb properly used gives perfect control over the inside of the hive. The comb, bees and all may be transferred from one hive to another in a few minutes; worms may be readily destroyed before they make progress in a weak stock; weak stocks may be strengthened by inserting frames of brood from a strong one: swarms may be made at pleasure by division; queens reared from selected stocks; empty combs may be utilized, and swarming checked by destroying queen cells, or inserting empty combs or frames in place of those removed to strengthen weak stocks.

Movable combs enable the bee-keeper to prevent the excessive production of useless drones by breaking out the drone comb, and also to see that the queen is at all times supplied with worker comb for laying eggs. Sometimes when honey is abundant bees fill the brood-nest with honey to the great injury of the hive. The daily mortality is very great in the working season and young bees must be reared very rapidly to replete the ranks of the workers to insure a large surplus of honey. Colonies dwindle down, become very weak and are often lost, because the brood-nest is filled with honey so that the queen has no place to deposit her eggs.

The extractor enables us to save this honey, and also save the colony by replacing the emptied comb in the brood-nest; this is the best remedy for the disease of too much honey, and its application secures a cash fee in extracted honey. These movable frames can be made practically useful only by adapting them to these four facts learned from the economy of the hive. Worker comb is made of the uniform thickness of 7/8 of an inch. The sides of the movable frame to contain the comb must be 7/8 of an inch wide.

2d. Bees need a passage of 3/8 of an inch. This is just the distance between two sheets of comb as found in the hive. It is just enough to admit of the free, easy passage of bees. If an opening be much less they will glue it up with propolis, and if much larger they will fill it with comb and honey. By making the outside of the frame 3/8 of an inch less than the inside of the hive all around bees respect this opening and glue them fast only where they hang on the rabbets. The frames should leave 3/8 of an inch passage all around when hung in the hive.

3d. Bees are less apt to build to planed than unplaned lumber. Then let the inside of the hive and the outside of the frame be nicely planed whilst the inside of the frame is left as sawed. This prevents fastening the frames and also conduces to the building of comb in the frames.

4th. Bees prefer to hang their comb to a sharp angle. By tacking or otherwise securing a sawed angle along the center of the upper bar of the frame, bees are induced to build along these sharp angles or comb-guides.

II. The outside measurement of all frames, and the inside measurement of all hives must be uniform, the former being at least 1/4 of an inch less than the latter in length and depth so as to leave the requisite space of 3/8 of an inch all around. No special damage is done if there is greater difference between the hight of the frame and the hive because bees will not fill up a small space below the bottom bars of frames, and when quilts are used above the frames instead of honey boards, the quilt fills the space.

Exact workmanship in the manufacture of hives is of the first importance. Unless every frame is made so that it will fit properly in any hive in the apiary, great inconvenience and trouble arises. Hives well made and well-painted will last a lifetime if made of good heart wood. No sap should be used, for the moisture from bees will soon destroy it. Good pine is preferable, but any sound lumber answers well.

III. Movable division boards in the brood chamber. This is simply a board of equal hight and depth with the hive with two little blocks above and below for fitting in the rabbets above and the entrances below so as entirely to separate the two parts of the hive. Its uses are:

1st. To contract the hive in early spring according to its strength. As the swarm increases it is readily slided out and an empty comb inserted in the cluster. By this means the heat of the colony is utilized and colonies increase much more rapidly.

2d. By opening through it suitable entrances, honey boxes may be placed beside the cluster. By using two for each hive, boxes may be placed each side of the cluster for surplus honey.

IV. The hive should be adapted for use either as a single or two story hive; so that the two stories may each be used for swarms or nuclei during the summer by having extra covers. When used single, quilts should always be used under the cover and above the frames to prevent injury from too great heat from direct exposure to the rays of the sun. By such an arrangement one can double up for winter, so as to have an air chamber all around for out-of-door wintering. Such air chambers are very important to preserve an equable temperature when exposed to wind and sunshine. Those who prefer wintering within doors will find it most convenient to have their hives made two stories though the stories may each be used separately. Then by a little care to leave, in packing for the winter, the top stories empty, they can be used in the spring for feeding.

The alighting board in front should be extended three or four inches, the sides of the hive the same distance, and this closed at the top by a board an inch less, so that by inserting against this an extra board, for out-door wintering, an air chamber is formed in front. This front board should have a 3x3/8 passage for the air at one end. The regular entrance first closed except a small space at the other end so that the light is excluded to a great extent, a strong direct draft prevented, and mice effectually excluded. When thus prepared, with small holes for ventilation near the top of the upper story, a good quilt above the brood combs and on this a bag of sawdust, excelsior, or straw matting, nearly filling the upper chamber, bees winter well out of doors almost anywhere in this country.

V. Bottoms may be made either stationary or movable. We believe it much better to make them stationary. When nailed across the bottom the bottom strengthens the hive very much. It is very difficult to keep movable bottoms so well fitted as not to leave cracks where millers can lay their eggs. There should be no cracks about a hive where millers can go and bees cannot easily follow them.

VI. Tops should be, if possible, all in one piece, with cleats across the timber underneath to prevent warping, and guide to its place. If made of two or more pieces the timber should be well seasoned, tongued and grooved, and the crack securely stopped with paint. The crack should always run from front to rear, so that the water will not have to cross the crack in running off, since hives should tilt forward a little.

VII. Size of brood chamber. If made for honey boxes, each side can be contracted to suit the swarm. The best size for ordinary use, is from 1,800 to 2,000 cubic inches, and made low rather than high

"PROGRESS AND IMPROVEMENT."

TERMS FOR 1876, IN ADVANCE,
INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.65 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $13.40; Seven Copies, and one free, for $17.20; Ten Copies, and one free, $21.50—only $2.15 per copy. The above rates *include postage* (under the new law,) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra—or $3.50 in all. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

ADVERTISING RATES:

Inside, 14th and 15th pages (Agate space)	.60c.	per line.
" 13th page	.70	"
Outside or last page	1.00	"
Fifty per cent. extra for unusual display.		
Special Notices, leaded, by count	1.25	"
Business "	1.50	"
Reading "	2.00	"

Discount on 4 insertions, 10 per ct.; 8 Ins., 15 per ct.; 13 Ins., 20 per ct.; 26 Ins., 25 per ct.; 52 Ins., 33⅓ per ct.

THE DECREASE OF POSTAGE.

The more this Postage business is investigated, the greater appears the outrage on the business interests of the country for the benefit of the few express monopolists. The revenues of the Government were not increased by higher rates on third-class matter, and notwithstanding the decrease of business, the cost of carrying was not lessened. The railroads carry mails under long contracts, and charge as much for running empty cars as for full ones. The distributing employes can handle a large increase of matter without burdening themselves or needing increased force. Neither the cost of carrying nor of distribution would be materially increased by third-class matter, even if the mails were quadrupled. In other words, the Government is running an immense and costly apparatus to do a small business when it might just as well do a large one—something like getting up steam on a twenty-five-horse steam engine for a work that needed only a one-horse power.

No wonder, under such management, that our mail service does not pay its way. Can any one say why, having all the expensive postal service in operation, it should not be used to the limit of its capacity and the people encouraged by material reductions in postage to make the most of it? The Postmaster-General stated to the Committee on Post-Offices and Post-Roads that prior to the 1st of December last, under the temporary revival of the franking privilege, he sent from Washington 250 tons of public documents, scattered over a period of seven months, and that it made no appreciable difference in the mails. This, however, is not an argument for the revival of the franking abuse. The surplus ability of the Post-Office Department to do a larger business should be made available for all the people. Instead of being made a gratuity to the very few who receive any benefit from free letters, seeds and other merchandise.

CONSUMPTION OF WHEAT IN ENGLAND.

The annual letter by Mr. James Caird about the Cereals grown and used in England shows some facts especially interesting to American farmers, who now have largely to make up the deficiency of English production. Previous to 1860 the annual breadth of British wheat land exceeded 4,000,000 acres, when the population was barely 28,000,000. The average breadth during the last eight years is 200,000 acres less, while the population has increased to 32,000,000. The produce of 3,000,000 acres of foreign land sufficed for our wants before 1870, that of 4,500,000 acres has been consumed in each year since that time. The consumption of wheat in the United Kingdom in the year 1874, may be stated in round numbers of 100,000,000 cwt., in the following order of supply:—Home growth, 50.7; United States and Canada, 31.5; Russia, 5.8; Germany, 4.0; Chili, 2.2; France, 1.1; other countries, 4.7; total, 100. This is subject to considerable fluctuation, Russia sometimes rising to 18 per cent., and America, as recently as 1872, falling to 12. But on the average of the last six years, the United States and Canada have taken the leading place, and Russia the second. The countries of Western Europe—Germany, France, Denmark and Spain show, he says, a declining export, either for a greater home consumption or lessened production. The mainstays are the United States and Canada and the Black Sea ports of Russia.

Russia has of late largely fallen off in its export of grain. This decrease is generally attributed to bad seasons and destruction by insects; but it is well known here that these causes are only symptoms of a more potent reason for unfruitfulness in the decreased fertility of the soil. It is highly probable that the limit of production has been reached in Russia, until increasing intelligence among her cultivators there, as here, develop a better system of agriculture.

THE N. Y. LIFE INSURANCE COMPANY.

The regular Annual Statement of this old and sterling company is one of the most complete and satisfactory exhibits that we have had occasion to review. In fact the statements of the Company have always been satisfactory, for they indicate that the business of the Company is kept well in hand, and that the result is that which follows from a happy blending of progressiveness and conservatism. Every years' statement is an improvement in the right direction upon its predecessor. The column of assets continually increases, the divisible surplus augments, the ratio of expense to income diminishes, while the number of policies and amount of insurances issued attest how steady and unwavering is the confidence of the public in the stability and integrity of its management.

The New York Life is one of the companies that does not go mad over new business, or spend the trust funds in its hands to subsidize recruits, but pursues a steady and eminently prudent and conservative course, issuing about so many new policies each year, increasing its assets at the rate of about four millions every year, and resting content to husband its resources and do its fiduciary duties well and thoroughly. The volume of assets now exceeds thirty millions and the divisible surplus five millions, that is, it would be solvent without these five millions, a portion of which will of course be repaid in the form of dividends or additions to policies. What this dividend may be will be better known a year hence, but if the past practice of the Company may be accepted as a precedent, the returns to policy-holders during the Centennial year should exceed three millions. Those of 1875 amounted to nearly fifty per cent. of the annual premiums.

The surplus remaining on hand is nearly two and a half millions, but this sum does not represent the total surplus that would appear if the Company calculated its liability by the New York rule instead of adhering to the severer standard which it adopted before New York had a rule,—and which we believe the Company will retain long after the New York rule is forgotten. According to its own rule its surplus is two and a half millions, while by the official standard it is quite five. All of which goes to show that the Company tests its own solvency by a more exacting standard than that which the law requires. The evidences of economy and careful expenditure are both gratifying and characteristic. The expenses of management were, in 1872, 12½ per cent. of the income: in 1873, one per cent. less: in 1874, less than ten per cent., and in 1875 but little more than nine per cent. Comment upon this is superfluous. The Company has no need for encomiums, for all the world recognizes its claims to be regarded as occupying a place in the first rank of trustworthy financial institutions.

RURAL NOTES AND QUERIES.

Black Bass in Winter.—Capt. Pence of the Aqueduct Ponds, Wenonah, N. J., who has during the past year made a specialty of Black Bass, writes the Rural New-Yorker as follows:—"If I may be allowed to coin a word, I should say that the Black Bass is 'hibernaceous.' Up to Jan. 1st I kept a number of them of various ages in two of my small reservoirs, in order to study their habits. One of these reservoirs is at the extreme head of a large spring, and the variation of the temperature of the water is very slight. The other reservoir is fed direct by a small spring, but most of the water comes from other springs, averaging about 150 feet distant, and this body of water varies with the temperature of the air from 50 down to 32 deg. on the surface. In November the bass in both reservoirs began to confine themselves to the bottom, although there was as yet no material change of temperature. In December the older bass kept to the bottom quite closely, though on sunny days I noticed that the younger ones approached the surface while the sun shone upon the water. Most of the older ones, on the contrary, sought the shade. They do not, however, appear to be so thoroughly hibernaceous in their habits as to refuse food entirely. I had a man digging a ditch near one of the reservoirs, and finding large numbers of the common red angle-worm, he threw them to the bass. They were generally consumed. The reservoir at the large spring is bricked, sides and bottom. The day before moving the bass from there I caught in an adjacent stream a six-inch pike, or pickerel, and placed it in the bricked reservoir. The next day, when I took the bass out, I found that the pickerel had disappeared."

The Ames Plow Co.'s Catalogues.—By the publication of their Catalogue of Ice Tools, the Ames Plow Co. recently gave us occasion to admire the taste with which it was gotten up, and now we have cause to express still greater approbation of a large octavo volume issued by that Company, called "Illustrated Catalogue." It was prepared for the press by Mr. J. Harris Reed, a gentleman well-known to the many friends and patrons of the Company, who, in this work, has surpassed himself. In addition to the fine tint of its paper, the excellence of its printing, etc., it contains 189 elegant engravings, thoroughly illustrating almost every implement which could be of use on the farm. The article upon the Plow is in itself good historical reading, while the rest of the volume is good reading for those interested. We are always pleased to see large manufacturing companies cause their catalogues to be prepared with care and to be issued in an attractive form. It not only looks successful, but is in itself an element of success; and we hope that every manufacturer who has not already done so will take a hint from the Ames Plow Co.

Tired of City Life.—A bank President of Worcester, Mass., speaking of the Northampton Bank robbery, the forgeries of Winslow, and other like items of commercial life, is said to have remarked: "I'm sick of this rascally world. Don't want to see or do business with anybody. I'd rather be an old farmer, living on a cross road, four miles from the sight of anybody, with a barrel of cider and two hogs, than to have anything to do with banks, money or men." A great many men long counted successful will echo the like words of Solomon, "All is vanity and vexation of spirit." But all of commercial life is not thus polluted, nor is "the lot of an old farmer living on a cross road, four miles from anybody," quite so enviable as the bank President's imagination, helped probably by the memory of boyhood days, has pictured it. Farmers well know that there are many and serious evils allotted to their lives; but very possibly this disclosure of envy of their assumed happy lot may make them better satisfied with their vocation, which is entirely the best in some respects.

Our American Staple—Corn.—Our highest export of corn is never more than four per cent. of the crop, and sometimes not more than one per cent. But English farmers are learning to use it as a feed for stock, and we may expect the foreign demand to increase. It never has been popular abroad as human food, possibly in fact because the meal or grain is apt to be injured by sea voyage, but more from prejudice. The small foreign demand results in undue depression of prices whenever the crop is above an average. But for the high price of pork and other meats our corn crop of 1875 would be much lower than it is. Corn is, however, the best possible safeguard against famine. Universal failure is never known, and in times of scarcity of other grains the great American Cereal is sure to be in demand, both at home and abroad.

"Honor to Whom Honor."—We are glad to observe, in a late number of the Prairie Farmer, honorable mention and recognition of the services to the Northwest of John S. Wright, Esq., who established that journal, and of the Rev. J. Ammoss Wight, who was its editor for many years. No two men in the land have done so much to promote Agricultural improvement in the West as these worthies, and they are entitled to a more substantial reward than the lasting gratitude of the farmers of a region whose settlement and prosperity they vastly facilitated and augmented. Why not manifest appreciation of their zealous, able and successful efforts in a tangible form, in return for benefits received therefrom?

The Potato Crop.—The abundance of this crop the past season is still felt in low prices. Owing to the mild winter there has been less loss than usual from freezing, and there is little present prospect of a rise. All the great markets are fully supplied, and in potato-growing regions a considerable portion of the crop remains to be sold. On one day, during the late mild weather, 1,250 bbls. of potatoes were shipped from Troy by rail—Peerless selling at six shillings, Prince Alberts and Early Rose seven shillings, and Peach Blows eight to nine shillings per barrel. The only satisfaction to be got out of these prices is that they mean cheap food for the poor.

Coal in the Adirondac Region.—It is announced that John J. Owens, our eminent geologist, has discovered superior hard coal in the mountains of Franklin Co. He reports the coal bed eight feet deep, and he has succeeded in tracing the lead over twenty-one miles. He has also discovered extensive beds of iron ore, copper, etc. The development of these mines will be of incalculable benefit to the business interests of Northern New York. The report of coal discoveries in New York needs some confirmation. Geologists have always thought coal impossible in this region.

Evergreen and Forest Tree Seedlings, Free.—The Editor of the Evergreen, Sturgeon Bay, Wis., informs us that he has growing upon his premises, of spontaneous growth, large amounts of seedlings of the above, of different sizes, and some ten or a dozen different varieties, which he will give away in any quantity to any person for his own planting only, by his removing them at his own expens. He will furnish full information regarding sizes, varieties, cost of removing, etc., to any person, addressing him as above, with stamps to pay return postage.

The Caledonia Co. (Vt.) Ag. Society.—At its recent annual meeting in St. Johnsbury, elected the following officers for the year ensuing:—Prest.—J. R. Kinerson, Peacham. Vice Prests.—Joshua Remis, Lyndon; C. J. Bell, Walden. Secy.—I. W. Sanborn, Lyndonville. Treas.—C. M. Stone, St. Johnsbury. The 29th annual exhibition of the Society will be held on the Fair Grounds in St. Johnsbury, Sept. 19-21.

RURAL BREVITIES.

Grand Traverse Grange, Michigan, has established a free course of lectures.

Louisiana is happy over a sugar crop of 145,000 hogsheads, the largest since 1861.

The National Butter and Egg Association will hold its annual meeting at Davenport, Iowa, March 8.

In certain towns in Switzerland, grapes are grown solely as medicine, and the vineyards are put to no other use.

A Michigan potato grower reports the Eureka "equal in quality to Early Rose, and Snowflake a little better."

J. B. Root, Seed Grower, Rockford, Ill., has sent us a copy of his handsome Garden Manual and Seed Catalogue for 1876.

Peter Coutts of Santa Clara Co., Cal., has recently purchased in Rhode Island several fine Ayrshires for his ranche.

There is a plum orchard in Oregon containing 4,000 trees—2,000 peach plum, 1,500 German prunes and 500 French plums. Curculio is unknown.

An acre of growing trees in forest fixes in the form of wood fully a ton of carbon. Most of this comes from the atmosphere and is absorbed through the leaves.

A School for Shepherds has been established at Rambouillet, France, where young men over fifteen are instructed in the Science of Sheep Husbandry. The course is for two years.

"Gladiator," the most famous of the French running horses, died in Paris recently. He was bred by Count La Grange, and in three years won for his owner $143,095 in purses alone.

James J. H. Gregory, the famous seed grower of Marblehead, Mass., favors us with a copy of his unique "Annual Circular and Retail Catalogue of Warranted Vegetable and Flower Seeds."

Arkansas exported grain last fall for the first time in its history. This state of things will soon become general in the Southern States, if the people do not continue to worship cotton as king.

Alfred Bridgeman, Importer, grower and dealer in all Standard Vegetable, Herb and Flower Seeds, No. 876 Broadway, New York, sends us his neat and well-arranged Annual Catalogues for 1876.

Mr. N. Hume, the importer and breeder of French horses, Brighton, Ill., died suddenly a few days ago. He was one of the most enterprising farmers of Macoupin Co., and had traveled all over the world.

The dam of Dexter died recently on the farm of Jona. Hawkins in Orange Co., at 27 years of age. Her sire was American Star. She produced fourteen foals, the first being Dexter by Hambletonian.

The Duncan Strawberry, which can be had of E. & J. C. Williams of Montclair, N. J., is worthy the attention of all cultivators. Whatever "Kittatinny" Williams recommends is pretty sure to be extra.

Botanical students and others interested, will please note that Prof. Gray's works on Botany, &c., are published by Ivison, Blakeman, Taylor & Co., whose advertisement in this paper gives titles, prices, etc.

Crosman Bros., Rochester, N. Y., send us their "Illustrated Catalogue and Guide to the Flower and Vegetable Garden, for 1876." Beautifully illustrated and neatly printed on tinted paper, it is ornamental as well as useful.

A tribe of Indians in Oregon has 8,000 horses and 2,000 head of cattle. Indian civilization tends to horses even more than our own,—or, is the tendency of Agricultural Fairs to horse-racing something other than civilization?

James Fleming, Seed Merchant and Importer, 67 Nassau St., New York, sends us his neat, well-arranged and copious Annual Catalogue of Choice and Select Flower, Vegetable and Agricultural Seeds, Garden Implements, Knives, &c., for 1876.

Mrs. L. E. Cotton of West Gorham, Me., reports that last year she took 380 lbs. of honey from one hive, all in glass boxes, and which she sold at 33 cts. per lb. She fed the stock early in spring to encourage early breeding, and kept it strong all through the season.

Farm buildings in California are very shabby and poorly cared for. The climate makes well-built homes unnecessary, and besides that a majority of farmers in California are pursuing the business as a temporary expedient, hoping when they get rich enough to live in San Francisco or return East with their money.

A. B. Sawyer has discovered a valuable lesson in the art of keeping apples. Having always been very careful to assort his fruit two or three times every winter, he now finds that handling makes it decay worse than to remain among the partly rotten fruit. Another advantage of this plan is in rigorously excluding bruised or imperfect apples when put up in the fall.

BUSINESS NOTICES.

Much of the White Lead sold as pure is adulterated from 20 to 50 per cent. Every keg of Eckstein, Hills & Co.'s **"Phœnix" brand White Lead** is warranted *perfectly pure*, white, fine and durable.

For Bronchial, Asthmatic and Pulmonary Complaints, "*Brown's Bronchial Troches*" manifest remarkable curative properties.

BRIDE & CO,
783 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

RECONSTRUCTSON.

In a wagon made of willow
Wheeled I once a little maiden,
Ringlets shining on the pillow,
Rolling homeward treasure laden,
Like a boat upon the billow,

Ten years fled. Ah, how I missed her
When we left the village school!
But she said she'd be my sister
As we lingered by the pool,
And I passionately kissed her.

Ten more fretting years renew it:
Little wagon made of willow;
Loving eyes are bent to view it;
Loving hands adjust the pillow,
And we've fitted rockers to it.

The Story-Teller.

THE PRETTY PLOTTERS.

A SCHOOL-ROOM FLIRTATION.

"Pride, pride, pride! There you have Charlotte Arden. Mischief, mischief, mischief! There you have Lizzie Dane. Look out for them both, Hart. And now, good-by. I'll pray for your success."

With this my friend, by whose influence I was installed in the academy of Marlboro, as principal, turned to leave me.

"Wait a moment, Mr. Jeffries; "how can I keep——"

"Clear of them?" he added, with a shy laugh. "Draw your own inferences. Handsome young men, with light purses, must make light hearts. When you catch a glimpse of your pupils you will understand me. I haven't been a teacher here for five years for nothing."

"Thank you! thank you!"

With this I gave my friend my hand, and thus we parted. An hour later I was seated at my desk in the pleasantest school-room, looking about me with no small degree of interest for the two pupils of whom my friend had spoken, and wondering in the meantime if his kindly, well-meant caution would not bring me at once face to face with the very danger which he had wished me to avoid.

Smiling at my own conceit, and failing to find in the threescore faces before me one that was particularly stamped with pride, or one that was marked with mischief, I turned to my books.

Something like a quick whisper broke through the stillness of the room as I did so. I glanced up. Every countenance bore unmistakable signs of demureness. Smiling again at my thoughts, I turned a second time to my books, and this time a big apple started from one of the back seats and came rolling down the aisle. The incident was slight; but, taken in connection with my reflection and my friend's parting words, it annoyed me. I picked up the apple, laid it on the desk, and glanced in the direction from whence it had come.

Goodness! what a pair of blue eyes were raised to mine at that moment! Eyes saucy, darling, and almost wicked, which wavered and brightened like two beautiful stars. This was Lizzie Dane, I was quite sure of that; the red mouth was dimpled about by smiles, and the white chin quivered with suppressed merriment.

"A good beginning," I thought; "it augurs well for the future."

Just then the school-room door was darkened and, looking up, I saw Charlotte Arden. My friend's caution was well. How like a beautiful picture she was as she stood there, her fine head covered with pretty braids, perfectly poised, her figure straight, round and perfect, brought out by the strong, clear light. The very fall of the soft, white robe, as well as her slender, gaitered foot, just visible beneath the folds of her sweeping skirt, was artistic. She stood, as if hesitating whether or not it was best for her to enter the school-room, and her manner was calm and quiet.

Miss Lizzie Dane telegraphed to her with her sparkling eyes to enter. This failing to have the desired effect, she doubled up her white, chubby hands, and held them to her mouth, trumpet fashion. I suppressed the smile that was rising to my lips and turned to Miss Arden, saying:

"Have you selected a seat?"

"No, sir, I have not," she answered, without moving forward a single step.

"You may do so now, if you please," I said.

She glanced up and down the long rows of seats several times, and then turned to a side desk but a short distance from my table.

"This one, sir," she said, raising her eyes for a single moment to my face and then turning them indifferently away.

I bowed in approval of her choice, though, at the same time, it did not please me. I did not care to have her so near, criticising everything I did, and I felt sure she would.

At the quarter-hour intermission Miss Arden and Miss Dane passed the time in pacing, arm-in-arm, back and forth on the blank space of floor before my desk. I could have wished, and did wish, that they had chosen any other promenade; but not knowing how to help myself unless I sent them out of doors to play, like two little children in pinafores, I raised the lid of my desk between their faces and mine and pretended to be engaged in setting my books and papers to rights.

Children in pinafores! I smiled grimly to myself as the audacious thought entered my head. Children they both were, I said to myself, unceremoniously thrusting my head above the temporary screen to confirm my opinion by a good look at them—a proceeding which made Miss Lizzie toss her curly head in a disconcerted attempt at carelessness, and brought a dash of exquisite color to the one velvet cheek of her companion's face which was revealed to me.

"And as for pinafores," I said, sulkily continuing my soliloquy and drawing in my head again like a turtle, "I'm sure they'd be vastly more appropriate and becoming than that little plaited and scalloped and puckered affair of plaid silk which Miss Lizzie wore under the dignified name of apron."

Such saucy little pockets, lined off with gimp and lilings—the corner of a tiny note and the profile of a big, yellow orange revealed from the distended mouth of one, and the lace edge of a handkerchief with a captivating rent in it, hanging jauntily from the other; such wicked, knowing tassels, such lengths of variegated silk cord round, round and round her pretty waist, as though once started it had lost its way, and had been traveling in a circle ever since instead of going straight ahead, as any sensible cord would have done that had been stout enough not to get becoiled on the road. It looked contented though, as if it didn't care a whit for the predicament it was in or whether it ever went straight again, as it could have that charming route to travel round and round, and I began to wonder.

"He's splendid, Lot; isn't he?"

Miss Dane's voice broke my wonderings. I was modest in those days and blushed easily. My wife told me so yesterday, referring to that morning, that the tip of my ear, just visible at the edge of my desk-lid, grew red as a coal; and that her friend threw a lozenge at it and missed it by the sixteenth of an inch. I wasn't aware of the circumstances before.

"Say, Lot, don't you think he's splendid?" came that loud whisper again.

"If I do, I don't intend to tell him of it," she retorted.

Evidently, however much averse she would have been to informing me on such a point, she was nothing loath for me to judge of her musical powers, for she burst forth into a merry song and warbled like a bird—in fact, like twenty birds. Whether my ear looked like a coal or not, it drank in that gay melody and, when it ceased, longed for more.

"What eyes he has!"

"Rather too deep-set for beauty."

"Deep-set, indeed! They are protruding as a cow's, and as big."

"Mere difference of opinion, my love. Don't let us quarrel."

"No. Then, how much character there is in his nose!"

"Decidedly."

I had a large nose, reader.

"Room for more—— "

I startled her there by dropping a book. I was actually getting angry. But she recovered from her fright almost immediately, and went on, in a still louder tone:

"How do you think he will answer?"

"Answer?"

Miss Arden spoke inquiringly in a puzzled voice.

"You speak as if you thought I intended to propose to him."

"And so I daresay you will, it being leap-year, and you so smitten."

A merry laugh followed this sally.

"In that case, I think he would answer in the affirmative."

"O, you conceited creature, Lot Arden!"

"Hush! What if Mr. Eldridge should overhear us!"

As if I hadn't overheard them.

"Who cares if he does? It's nothing to him."

Nothing to me! to sit there and hear myself discussed in that way! O, nothing at all!"

"But seriously, what do you mean?"

"Why, have you forgotten that I prophesied a flirtation? I mean, how do you think he would do for that?"

Ah, a flirtation! Maybe I didn't hold my breath for fear of losing the answer, and then maybe——

"O, passably, if he understands his place and stays in it."

"Men—boys!"

"Well, boys, then. Men in assurance, boys in intelligence, are what we have nowadays."

She spoke as if she had lived in the age of her grandmother. I clenched my hands and declined Jupiter under my breath in Latin.

"Do you think you'll succeed in bringing him around?"

"For shame. I'm sure I have no such design on his peace."

"Now, really, I am aching to know what you intend to do. Shall you flirt with him?"

My intentions were not consulted; but I made them, nevertheless, biting my finger nails viciously all the time.

"Oh, no matter."

"You're too bad. I got you apart from the other girls on purpose to have a confidential chat, and here the time is almost up and you haven't told me a thing."

"Well, I will now—two things. Your hair is twisted out of your net and your collar is shockingly tumbled."

"Bother my collar! Shall you flirt with him? I wouldn't mind, only that hateful Sue Liscomb vows she'll get ahead of you, and I don't want to see her win. Now, do you tell me!"

I laid my hand upon the bell and gave it a violent ringing. The two girls started like culprits and glanced hurriedly up at me. What they saw in my face I can't say, but they both colored. Just then they separated for their seats, but not before I heard Lizzie whisper desperately, "Shall you?"

"I shall!" floated back the reply, low and firm, as if determined not to be mistaken.

That afternoon while I was engaged with the French grammar class, I was startled by a sharp little scream, and by Lizzie Dane springing up and crying out:

"O, a hornet has bitten Charlotte Arden, Mr. Eldridge."

The whole school tittered. I scowled very pedagogucly (to coin a word) and commanded her to resume her seat.

Lizzie flounced into her seat, very red in the face, and I saw Miss Arden put a book to her face to conceal a smile.

After school I went to her and inquired politely for her arm. She showed me her round, dainty wrist, with a large, discolored swelling marring its whiteness.

"Good heavens!" I exclaimed, forgetting myself, "how it must have pained you! Why didn't you go home? I would have excused you."

She smiled and looked amused. That smile recalled me to myself.

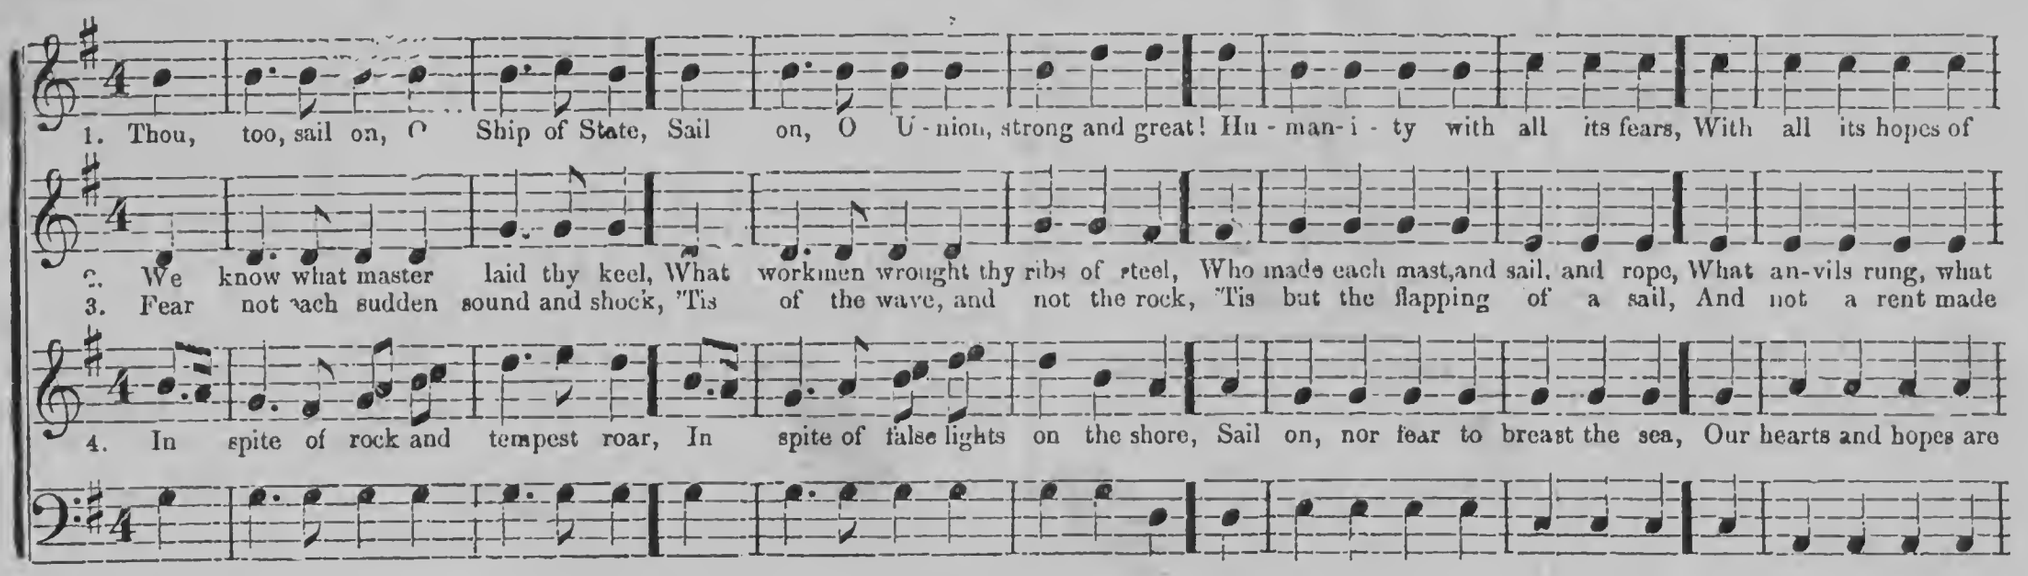
"Oh, it's nothing. It was slightly painful at first, but I was not child enough to run home over so slight a hurt."

In spite of my anger at her, I envied the very words that slipped through her red, haughty lips. "Had she already begun her arts?" I asked myself. If that simplicity of look and frankness of voice were art why, confound Nature! Well, I walked home with her, carrying her satchel of books. My excuse was her arm. As if she hadn't but one and couldn't, by any possibility, have carried her books on the other. O, the days that followed—and the weeks and the months! Miss Arden wanted to flirt and we flirted! Miss Arden wanted me to make love to her and I did it. Of course, I had no further exposition of her wishes on the point than the overheard conversation of the first day; but that was enough. I took the part assigned to me to play and played it with all my heart.

I had the satisfaction of knowing, as I stood by one of the long windows at the close of the last day, watching the scholars file out, that the whole village was alive with the rumor that my beautiful pupil and myself were engaged.

THE SHIP OF STATE.

Words by LONGFELLOW.



Charlotte Arden lingered behind the others, as if wishing to speak to me. The coquette had her last snare set, I thought, bitterly.

"I—I stopped to bid you good-by," she said, falteringly, as I approached her. How the proud face was humbled by its blushing. "And to—to give you this."

She held out a white rose—a withered white rose. It was one I had begged from her hair the night before at a party and she had refused it.

"Thank you. It will be a cherished souvenir."

I spoke derisively, for all the bad blood in my heart was aroused by her crowning artifice. The words were scornful, but they were true, in spite of me. She looked up with a shocked expression and made a half-angry motion to snatch the flowers from my hand.

"We have had a very pleasant flirtation—have we not, Miss Arden?"

"Flirtation!" she faltered.

"Yes. This will remind me of it when I am far away."

I saw the mighty pride that struggled in her face.

"I don't quite understand you, sir," she said, with dignity.

"I refer you for an explanation of my words to the conversation you held with Miss D— about the first day of the term."

She looked puzzled.

"I did not have any," she replied, after a moment's hesitation.

"About flirting," I suggested, to prompt her memory. "You were to win me away from Sue Liscomb, I think."

She leaned her head on her hand a moment, wondering and confused; then she lifted it and broke into a merry laugh.

"What an absurd mistake! And you overheard us, and have been laboring under that impression all these months! O, Mr. Eldridge, how could you?"

And as though some sudden recollection well-nigh maddened her, she hid her face in her hands and broke into a choking tempest of tears.

"What is it, Charlotte?" I inquired, softening in an instant, and feeling that I had been acting like a miserable fool.

"We were not talking of you at all, sir," and the hot, blinding tears flowed afresh.

"Not talking of me! It was all my own insufferable conceit, then! What an——"

"Idiot," I said aloud, and "monkey," under my breath.

She drew up her head a moment later and would have left me, but—but——

Pshaw! The scene won't bear rehearsing. Charlotte Arden is my wife now.—*St. Louis Democrat.*

AN OLD-TIME SPECULATION.

How a Lake Vessel was Sent Over Niagara Falls—Queer Passengers.

CAPT. GILBERT PRATT, a veteran mariner now living in Belleville, Ont., whose period of service on the lakes dates back nearly half a century, recalls an incident which, though it has been almost forgotten, attracted considerable attention in its day. Vessel owners were then more conscientious than now. They were not inclined to risk the lives of passengers and crew in unseaworthy crafts.

The owner of the old schooner Michigan—then the largest vessel on the lakes—hit upon a novel expedient for disposing of her. The vessel had become old and rotten, and was no longer serviceable. Instead of loading her and sending her out late in the season heavily insured to be wrecked, he chose a more harmless plan, but one not less profitable to himself. He induced the proprietors of the hotels at Niagara Falls to buy the vessel and send her over the falls. This was about the year 1830. The proposition was eagerly accepted by the hotel proprietors, who saw in it a capital advertising scheme, and one which would be certain to pay them well. The affair was widely published in the newspapers and was the talk of the surrounding country for weeks and weeks. They did not count amiss when they judged what an excited public curiosity would do. For several days previous to the great event the stages and canal boats were crowded. People flocked thither from all parts of the country to witness the novel spectacle of the largest vessel on the lakes going over the falls. The hotel keepers reaped a rich harvest. So great a crowd had never before been seen at that famous resort.

On the appointed day the Michigan was towed out into the rapids in the presence of a vast number of people who lined the banks or visited the scene upon the numerous excursion boats which were called into requisition. The task of towing the vessel into the current was intrusted to a Capt. Rough, with a crew of half a dozen oarsmen selected by himself. This was a rather hazardous enterprise, and Capt. Pratt, who was himself one of the crew, says his heart almost failed him when they set out, though he had gladly volunteered for the service.

There had been placed on the schooner several animals, in accordance with the programme, which had been widely advertised. These consisted of a buffalo, three bears, two foxes, a raccoon, a cat and some geese. At her bowsprit was the American ensign and at her stern the English Jack, the Canadian hotel-keepers having joined in the enterprise. There were also some effigies displayed on board to give the appearance of a crew, and to make more real the scene of a vessel with all on board making the terrific plunge. Just before the tow-line was cut the animals on board were turned loose. Just as the vessel entered the rapids two of the bears plunged overboard and actually succeeded in swimming ashore. The third one climbed the mast as if to get a better view of the scene.

All the animals seemed greatly frightened and ran from one end of the deck to the other, much the same as a human crew might have done under similar circumstances, in an agony of despair. The vessel swept grandly down the rapids, plunging over the first fall, shipping a little water, righting herself and moving on in fine style. In going over the second rapid the mast went by the board and the bear with it, and neither was again seen. She swung around and presented her broadside to the foaming waters. She had evidently struck a rock and was stationary. Here it was thought her career was ended and the affair was over. But she stopped only a moment. The force of the waters swung her around and she moved on, stern foremost. On the third rapid she lilged, but carried her hull apparently whole straight to the Horseshoe fall, over which she plunged stern foremost to the foaming abyss below. She was smashed into a thousand fragments. None of the beasts on board were ever heard of more; but the geese turned up all right and were soon seen on the bank below, quietly oiling their feathers, as if there had not been much of a shower after all. One of the effigies was also found uninjured, throwing his arms about and knocking his knees together in the eddies, but all the others had disappeared. The scene was a most thrilling one. The great crowd of spectators watched the progress of the vessel with breathless interest, and gave a great cheer as she made the final plunge.

"GO WEST, YOUNG MAN, GO WEST."

THE name of Horace Greeley is connected so often with the words, "Go West, young man, go West," that the one is seldom thought of or spoken without the latter. The phrase "Go West," may have been used often in Mr. Greeley's paper, but the origin of the words—the incident that brought them into being and made them as familiar as household words, is not generally known. It may be of some little interest to RURAL readers, and so we give it.

Tom Lincoln was an out-and-out specimen of the New York easy, devil-may-care hangers-on. He always had some position about the Custom House or City Hall, and Greeley, in his peculiar way, had taken a strong fancy to him. Greeley called Lincoln "Tom," and Tom called Greeley "Horace," whenever they met. If Tom by his too easy ways lost his sinecure of bookkeeper or deputy something or other, he went at once to the dingy little room in the Tribune building and had a session with Horace, and the result was that Tom's name was very soon on the pay-roll of some department.

One day Tom came swinging into Mr. Greeley's room, threw himself into a chair, and in his usual tone said:

"Horace, I'm up a stump again, and must have a place."

Mr. Greeley never looked up from his paper, but simply bobbed his spectacles a little and said:

"Tom, how long was you in the Custom House?"

"Six years, Horace."

"How long at the City Hall?"

"Ten years, Horace, off and on."

"Sixteen years. Well, Tom, how much money have you made?"

"Not a cent, Horace."

"Not a cent—not a cent." (Some little *italic* words, as the printers call them, were interspersed with the remark, but we leave them out.) "Sixteen years in office in New York City and never saved a cent. *Go West, young man; go West.*"

Tom tried to explain that he had been honest and his salary low, and all that; but he might as well have talked to a stone or a post. Horace Greeley had done with him.

From that day on Tom and Horace were not on speaking terms, and we heard Tome say one day, that he never thought of the old philosopher that there did not come ringing into his ears the prophetic words, "Go West, young man, go West." This is the origin of the phrase, as Tom Lincoln and those who knew him well will tell you.

SAMANTHY'S ELOPEMENT.

"YES," said the old lady, as she wiped her eyes and proceeded to tell the sympathizing neighbors about the elopement of her daughter. "Yes, Mrs. Blobbs, you may well say it ar' a dreadful stroke. I ain't had such another shock senco that last spell o' rheumatiz. To think that darter of mine would do sech a disgraceful thing after all the care an' affection me an' her father have ravished on her from her infancy up.

"Did you not suspicion that they were contemplating such a move?" asked the neighbor.

"No, we never suspicioned nary contemplation. After I'd runned the conceited upstart off the premises with a mop, I didn't think he'd have the insurance to speak to Samanthy agin. An' she seemed to appear so consigned that I never respected her of having any under handed contentions. But all the time—so I've heerd sence—they used to meet clandestinely, when I thought Samanthy was at meetin' an' decoct their plans to run off an' elope. Well, Samanthy has made her bed an' she'll have to lay on it. I wash my hands of the ongrateful girl from this time forthwith."

"Did you make any effort to intercept them?"

"No, you see, we didn't know it, or else we'd a intercepted 'em within an inch o' their lives."

"I mean did you try to have them stopped when you found they were gone?"

"Yes, indeed. Father telescoped to five or six towns, an' give their prescription—cost him lots o' money, too; but he said he wouldn't mind spendin' the price of a cow to get Samanthy back. But we never heerd nothin' from them, and I told father to let 'em alone and they'd come home after a while with five or six children behind 'em. But I tell you, Mrs. Blobbs, they shan't set a foot in this house except over the dead body of my defunct corpse. You just remember that."

EVERLASTING FIRE.

IN the neighborhood of Baku, on the Caspian Sea, there is a phenomenon of a very extraordinary nature called the everlasting fire, to which a sect of Indians and Persians called Gaurs pay religious worship. It is situated about ten miles from the city of Baku, in the province of Shirvan, on a dry, rocky piece of ground.

On it there are several ancient temples, built of stone, and supposed to be all dedicated to fire, there being one among them in which fire-worship is now carried on. Near the altar there is a large, hollow cane from the end of which issues a blue flame. The worshippers affirm that this flame has continued ever since the deluge, and they believe if it were suppressed in that place it would break out in another.

At a short distance from this temple there is a horizontal gap, two feet from the ground, about six feet long and three broad, out of which comes a constant flame of the color of that in the temple. When there is a strong wind it rises to the hight of eight feet, but is much lower in calmer weather.

The earth around, for more than two miles, has this extraordinary property, that by taking up two or three inches of the surface and applying a lighted lamp, the part uncovered immediately takes fire, even before the flame touches it. The [illegible] make the soil hot, but do not consume it nor affect what is near with any degree of heat.

It is said that eight horses were once consumed by this fire under a roof where the surface of the ground had been turned up and by some accident had ignited. If a cane or tube of paper be set about two inches into the ground, closed with earth below, and the top of it touched with a live coal, a flame will immediately issue forth without consuming the tube, provided the edges be covered with clay. Three or four lighted canes will boil water in a pot, and are sometimes used to cook victuals. The flames have a sulphurous smell but are inoffensive.

A MAN'S NEIGHBORS.

THE Raleigh (N. C.) News reports that Rev. Dr. Pritchard of that city referred in a thanksgiving sermon to a conversation held some years ago between Dr. Thomas E. Skinner, formerly of Raleigh, now of Georgia, and an anti-missionaryist. Dr. Skinner, he said, was soliciting aid to *foreign* missions, and applied to this gentleman, who promptly repulsed him with the reply, "I don't believe in foreign missions, and I won't give anything except to home missions. I want what I give to benefit my neighbors."

"Well," replied Dr. Skinner, "whom do you regard as your neighbors?"

"Why, those around me," replied the brother.

"Do you mean those whose land joins yours?" inquired Dr. Skinner.

"Yes."

"Well," said Dr. Skinner, "how much land do you own?"

"About five hundred acres."

"How far *down* do you own?" inquired Dr. Skinner.

"Why, I never thought of it before, but I suppose I own half way through."

"Exactly," said Dr. Skinner; "I suppose you do, and I want this money for the Chinese—the men whose land joins yours on the bottom."

The hardened brother had never thought of that, and gave a good sum for foreign missions.

SO NEAR AND YET SO FAR.

NOT many months ago, in India, a gentleman and wife having taken passage for England went on board with their baggage. Presently the husband discovered that there was time for him to go ashore and see a man. He went, and when it occurred to him that it was time to go aboard again, he hailed a boatman and ere long found himself on board a large passenger ship. It was night. A sleepy steward inquired the number of his cabin, which he chanced to remember, as also that his was the upper berth; so he contrived to clamber into it without disturbing his wife as he supposed, who slept beneath. But when dawn broke and the ship was well on her way, a feminine voice was heard shrieking in terror, "Steward, steward! there's a man in my cabin!" The wretched man was aroused, and the situation explained to him. He had mistaken the ship. They were under way for Australia, and his unhappy wife was steaming away to England under a firm conviction that he had been robbed and murdered by ruffians who frequent the quays. When he at length arrived in Australia he could not even there relieve her mind, as the cable connecting that country with Europe was not completed, so that about four months passed before she heard anything of him.

OF how many cheap, exquisite joys are these five senses the inlets! And who is he that can look on the beautiful scenes of the morning, lying in the freshness of the dew and the joyful light of the rising sun, and not be happy? Cannot God create another world many times more fair? and cast over it a mantle of light many times more lovely? and wash it with a purer dew than ever dropped from the eyelids of the morning?—*Edward Irving.*

Sabbath Reading.

THE RETURN HOME.

I FORAGED all over this joy-dotted earth,
To find its best nosegay of innocent mirth
Tied up with the bands of its wisdom and worth;
And oh, its chief treasure,
Its innermost pleasure,
Lay always at Home.

I asked a poor widow, returned from the post
With a letter she kissed, from a far-away coast,
What heart-thrilling news had rejoiced her the most?
And—gladness for mourning—
Her son was returning
To love her at Home.

I whispered the prodigal, wanton and wild, [child!
How changed from the heart that you had when a
So teachable, noble, and modest, and mild;
And, though sin had undone him,
Thank God that I won him
By looking at Home.

I pictured his welcome from hearts that were beating:
The fond mother's glance, and the fatherly greeting:
[illegible] words could not tell half the joy of that meeting:
The festal of love
Seemed to point me above
To the Heavenly Home.

CHRIST OUR EXAMPLE.

BY MAY MAPLE.

IT is beautiful to contemplate the life of the Son of GOD. The evening dews and earliest dawn found the Saviour seeking wisdom at His Father's throne. His whole life was fraught with zeal and devotion to the cause for which He was sent among the children of men. To draw all into the kingdom of His love He would fain spend His whole life.

His pleasure was to do the *will of His Father*—so different from the youth of the present age, or even of the age in which He lived. Cheerful He might be, but never gay. Studious He was, even in early childhood, to an uncommon degree. At the age of twelve we read of His sitting with the priests and elders to learn of them, while His brothers and companions were no doubt filling their hands at the confectioners, and planning for the merry dance and jubilant song. Happiness for the present moment was seemingly sufficient for all *their* needs. And because of their levity and demoralizing influence He was often put to an open shame. "Is not this the carpenter's son?" was asked in sneering tones and with scornful lips, when He taught as one having authority and not with the smooth, oily tongue of the scribes. Because He was apparently of low birth they desired to know nothing of His virtues or His worth. If they listened to His eloquence—and this they did, not unfrequently—it was but to criticise His sayings, to humble Him in the dust, if by it they might make Him give up preaching and praying round about those old Judean hills. It was among the lowly that His teachings were found most attractive and acceptable. "The common people heard Him gladly."

However much the Pharisees might desire exclusiveness in their worldly pursuits and associates, it was their pleasure to see the synagogues well filled with the humble laboring class. Of them they might gain tithes of mint, anise and cummin, wherewith to fill their censers. But to be interested in the minute affairs of their everyday life was seldom, if ever, in their creed. What wonder then that the young Prophet, Priest and King should draw all nations unto Him, from the wealthy Jew to the humble Galilean! His sympathies were with the suffering and the oppressed.

The sunsets of Judea beheld Him ministering to the sick, healing diseases, consoling the afflicted by His timely presence and calm, gracious mein. The light of His countenance beamed alike upon the sinner and the saint. No one was fallen so deeply in degradation but His strong arm was ready to raise the brother or sister. Did temptation assail again and again, so often did He forgive, if the stumbling one but came in humility and sorrow, confessing his weakness. All His energies were spent in doing good to His fellow men. Born with like passions as we are, He had the same temptations with which to contend—the same humiliations to endure. He must battle with poverty and privations; yet he practiced all the virtues of patience, forbearance, meekness and charity. His whole life was filled with lessons to be practiced by His followers.

THE BIBLE is a book that should be read like other books, in a broad and comprehensive way. The length of the creation period, the tonnage of the ark, the capillary relations of Samson's strength, the guerrilla skirmishes of the Judges, the ram's horn signals in front of the walls of Jericho—these are questions about which no sensible Christian cares a fig. What we need as regards the Bible is a rational interpretation of the history and its doctrines.—*W. H. H. Murray.*

ALL languages have a literature of terror about death. But living is far more terrible in reality than dying. It is life that foments pride, that inflames vanity, that excites the passions, that feeds the appetites, that founds and builds habits, that establishes character, and, binding up the separate straws of action into one sheaf, hands it to the future, saying, "As ye have sowed, so shall ye reap." And again, "As ye reap, so shall ye sow."

THE sweetest book in all the world, if properly read, is the Bible. Its leaves are as fragrant as a bed of violets in full bloom.—*Golden Rule.*

Ladies' Portfolio.

OLD MEMORIES.

BY RAY HULBURT.

In the early days of childhood,
When my heart was light and free,
And the hours with sunshine flooded,
Shed their radiance over me.

There, among the dearest day dreams,
Of the long-lost "Auld Lang Syne,"
Stands among the brightest sunbeams,
The school-house of ancient times.

Westward, sloping from the farm-house,
Ran the ever-pleasant lane,
Down to where the old log school-house
Nestled humbly on the green.

High, above its wide-mouthed chimney,
Towered the poplar and the beech,
While the wild rose and the cherry
Told a tale of sweetness each.

Round me hover bright-winged visions
Of the merry, murmuring rill,
As it speeds upon its mission
Close beneath the southern hill;

With its waters, gay and noisy,
Trickling o'er their pebbly bed,
And its banks, so green and mossy,
With the hidden berries red.

Far above, the green-leaved branches
Of the forest swung and played,
And beneath, the scene entrancing
Of the ever-varied glade.

Oh! ye gems of childhood's pleasures,
Flash your brightness over all,--
Live, among the golden treasures,
Garnered up in Memory's hall.

MY MYSTERY.

GINGER COOKIES—GOOD AND BAL

I AM very fond of ginger cookies, but alas, have not the *capacity* to make them. Shortly after I was married I spent a few months at my father's. A lady friend spoke of a receipe that never failed her. I handed it over to NORA, the cook, who transformed the ingredients into a crock of nice moist ginger cookies. They soon disappeared, and it was again filled and so on until faithful NORA placed them on the top-most shelf in the pantry, where slippery fingers could not reach them as easily as before.

I expected soon to go to housekeeping, and visions of pleasant rooms, snowy bulscuit, and splendid ginger cookies, passed before my imagination and lulled me to sleep at night. I returned to my husband, and it was not many days before I tried my skill. When they came from the oven the result was hard, dry cookies. I consoled myself with thinking that they would grow moist with age, for ANNIE had said, concerning them, "the older the better." I brought some to the table, and imagine my dismay to see the men picking out the soda between each bite with their forks.

"Oh, JOHN," I said, "I did want to have them just to suit you."

"They are not very bad," said he, "only a fellow has to look out for the soda."

"The recipe is good, I know, for NORA'S were splendid, and next time mine will be all right." Again and again I tried, and still the same result. It seemed to me that the men always commenced digging out the soda when I looked toward them."

"I'm sure I do my very best to dissolve and pulverize it," I said. "It must be because the soda is stale."

JOHN promised fresh, but I dismissed ginger cookies. A year after I picked up the RURAL and saw my old recipe recommended as being very nice. "I'll try it again," I said to myself, and I did. Not long afterward my husband came in and said, "I am going to Pittsburgh on the afternoon train. I wish you would do me up a lunch." With fear and many doubts I put some of my pet cookies in his pocket.

Sabbath we went to church and sat in the first seat in front of the pulpit. The "Amen corners" were full of people. After the benediction was pronounced JOHN picked up his overcoat to put it on, when out rolled a cake. It fell on the carpet with as much weight as a stone, and sounded as if it had been baked forty years. If it had only been content to fall, but it was not through traveling yet, and rolled on until it reached the pulpit steps at the side furthest from us, and the minister looked down upon it reprovingly for desecrating the LORD'S house. People smiled, and would have laughed outright if they had dared, for my husband was determined not to lose it, but followed, captured, and placed it down deep in the depth of his pocket.

A few days ago I got another recipe and did my best toward making the cookies palatable. I tasted, smacked my lips over them, tried to persuade myself they were good, and placed them on the table. They were passed around and the jokes followed at my expense. It was four years since I tried the first time, and here was failure again. A school-girl came in hungry in the evening and said "she liked them," so I gave nearly all to her, and tried again. The second time they were worse than the first. I then rode five miles to see the lady that gave me the recipe. I will insert it here:

"New Orleans molasses, 2 cups; brown sugar, 1 cup; butter, 1 cup; sour milk, 1 cup; 2 tablespoons of soda, and 1 tablespoon of ginger."

"You are sure you put in everything?" asked the lady.

"Quite sure," I answered.

"And used New Orleans molasses, for it is the best."

"Yes," I said.

"And you stirred them with a spoon, did you, and put sufficient flour on the board to roll out without making them very stiff?"

I again nodded assent.

"Well, I cannot tell why they are not good. I have some nice ones in the house now," she said.

A few days after I was leaving home, I said to MARY, our girl, "I wish you would bake some ginger cookies," and I gave her the benefit of my wisdom. When I returned we had some for tea. My husband said "they were the best he ever ate," and MARY said "she made them exactly as I told her." Why cannot I make them and have them good? Oh that somebody's mantle would fall on me! M. L. S.

WHAT MEN NEED WIVES FOR.

It is not to sweep the house, make the bed, darn the socks and cook the meals, chiefly, that a man wants a wife. If this is all he needs, hired help can do it cheaper than a wife. If this is all, when a young man calls to see a lady, send him into the pantry to taste the bread and cake she has made; then send him to inspect the needlework and bed-making, or put a broom in the young lady's hand and send him to witness its use. Such things are important, and the wise young man will quickly look after them; but what the true man wants with a wife is her companionship, sympathy and love. The way of life has many dreary places in it, and man needs a companion to go with him. A man is sometimes overtaken by misfortunes; he meets with failure and defeat; trials and temptations beset him, and he needs one to stand by and sympathize. He has some hard battles to fight with poverty, enemies and sin, and he needs a woman that, when he puts his arm around her, he feels he has something to fight for, and that she, being a true woman, will help him to fight; that she will put her lips to his ear and whisper words of counsel, and her hand to his heart and impart inspiration. All through life, through storms and sunshine, through conflict and victory, through adverse and through favoring winds, man needs a woman's love. His heart yearns for it. A sister's or a mother's love will hardly supply the need. Yet many seek for nothing further than success in housework. Justly enough, half of these get nothing more; the other half, surprised beyond measure, have gotten more than they sought. Their wives surprise them by bringing out a noble idea in marriage, and disclosing a treasury of courage, sympathy and love.

FOR AND ABOUT WOMEN.

MRS. JOHN ADAMS was an early advocate of Woman's Rights.

GEORGE ELIOT, it is said, has been paid £7,000, or $30,000, for a single novel.

MRS. JULIA GRIFFIN of New York has completed a portrait bust of Rev. Dr. E. H. Chapin.

DEBORAH F. WHARTON of Philadelphia has given $5,000 to the endowment of Swarthmore College.

MISS BURRITT has raised $1,000 to employ a lady to keep a Kindergarten at the Centennial Exposition.

QUEEN VICTORIA has subscribed £200 to found the chair of Celtic Literature in Edinburgh University.

SEVERAL women have been registered in some of the towns of Chili as qualified voters, and will vote at the approaching elections.

"MOTHER STEWART," who was prominent in the Ohio woman's movement, has been visiting England in the interest of the Temperance cause.

MISS SHIRREFF has been elected president of the Froebel Society of London, in place of the lamented Miss Doreck, who died last summer in Switzerland.

MRS. RAMASWAMI, a native Hindoo Christian lady, has been appointed by Maharajah Holka as tutoress to the zenana of Bala Sahib, the young prince.

MRS. LIVESEY, widow of Rev. William Livesey, is supplying the pulpit of the Methodist church at Braintree, Mass, made vacant by the death of her husband.

MISS EMILY L. TAYLOR, Principal of Adams' Female Academy, is preparing a history of that institution for the New Hampshire Department at the Centennial.

MRS. ABRAHAM LINCOLN, who was rescued from an Insane Asylum by Mrs. Myra Bradwell and her husband, has been spending a few months very pleasantly with her sister Mrs. Edwards, at Springfield, Ill.

MRS. AMANDA SMITH, a colored evangelist, has been addressing large congregations in Wilmington, Del. She was formerly a slave, is about forty years of age and shows great familiarity with Scripture.

MISS THOMAS, Cornell University's successful representative in Greek, entered college in advance, graduating in two years. Having slender means, she worked in the University printing office at type setting, and paid most of her expenses in that way.

THE Women's Centennial Union of N. Y. City has issued an appeal—signed by many ladies of social prominence—urging the women of New York to show their interest in the Centennial Exhibition, and proposing as one indication of this interest to present a banner, bearing the arms of the city and an appropriate motto, to the Woman's Department of the Centennial.

Reading for the Young.

MY KITTY.

WHERE has my little kitty gone,
My kitty that I love?
I've searched in every room below,
And every room above.

My tabby kit, with silken hair,
And golden eyes so bright,
And full of fun and frolic gay,
With spirits ever light.

How she would whisk to catch her tail
Or play with ball or string!
So full of grace and fun and life,
A dear, bewitching thing.

Alas! the merry kit has gone,
With all her capers gay;
She's now a dull and lazy cat,
And sleeps her time away.

LETTERS FROM BOYS AND GIRLS.

From a Northern Illinois Boy.

UNCLE MOORE:—I join my voice with the rest of the RURAL Cousins in asking what has become of Cousin JOHNNIE. As for me, I have missed her letters from the RURAL for a long time. I can assure her they were interesting. Girls, I guess you have given Y. B. such a set-back that he cannot come forward any more. I think if he had signed his name O. B. it would have suited him better. I should like A. R. MACOMBER to rise and explain to the boys how to keep on the right side of the girls. We are having a mild winter in Northern Illinois; not even one day's sleighing. I live just one mile from the Lake Bluff camp meeting grounds. They bought the land last spring and commenced work on it, expecting to have it ready for their fall meeting, but failed to do so. I expect they will have it ready by next fall. And then I would like to see Uncle MOORE and all the RURAL Cousins, even Y. B., at my end of the world. I suppose the way you and all the RURAL Cousins will be known to each other will be by their smiling faces, for I don't think any one can be a subscriber to the RURAL very long and not have a smile on his or her face. I am a farmer's son, and for pets I have a large Newfoundland dog and a gray mare. So you see I dare not side with YOUNG BACH, because I would be siding against one of my pets—and I could not do that, as she is real lovable and never scolds, nor do I think any good girl would, especially a RURAL Cousin.—JOE. CONDELL, *Rockland, Ill. Jan. 31.*

From a Virginia Girl.

DEAR EDITOR:—I am 11 years old, and this is my first attempt at writing for a paper. I love to read the letters in the Young Folk's Column very much, and if you think this is worth its room in your paper, I will try again some time. My father has an iron foundry, and on cast days I like to go and watch the melted iron being poured on the flasks; to make plows, bells, etc. I have two brothers that work in the foundry. They make such cute little frogs, just like real ones, to put against the doors in summer to keep them open; ours often makes folks jump, it looks so much like a live one. I go to school, and have lots of fun at recess and noon; but I don't let fun interfere with my lessons. My sister and myself joined a Lodge of Good Templars that was organized last April. We have 189 members, and others are still coming in. We meet once every week. I think the Temperance folks are doing a great deal of good. I'm afraid you will think this too long for a little girl, so I must stop. My parents know nothing of this. I want to surprise them—that is, if you think this good enough to publish.—R. LIZZIE TAYLOR, *Lincoln, Loudoun Co., Va.*

From a Western Penn. School-Girl.

MR. EDITOR;—I have received as a premium for my club, consisting of ten subscribes, your prize, "McAllister's Household Microscope." It is much nicer than I expected. It paid me well for what little trouble I had in securing the club. I should have liked very much if I could have gotten more subscribers; but perhaps I can if I try again. I guess I have said enough about that. I will now tell you where I live and about our school. I reside nearly five miles west of Erie City, in Pennsylvania, on the main road, and in a very lively neighborhood. I attend No. 5 School. It is not so full this year as it was last, on account of some of the larger scholars attending other schools. But I guess I am forgetting myself, for my letter is getting pretty lengthy, and if I do not close soon it will find its way to the waste-basket. Hoping to hear from some of my schoolmates soon, I will say good-by.—EMMA J. L., *West Mill Creek, Pa.*

From a Southern N. Y. Boy.

DEAR SIR:—The other boys are all writing, so I think I might as well. I live on a farm. We have taken the RURAL about a year. I like it first-rate. We have not got all of our corn husked yet. We have a chicken, hatched the middle of April, that made a nest in the grass, laid twelve eggs and hatched seven chickens before the middle of October. I went quail shooting a while ago with another boy, but as we started only one covey, we did not get any. I like to go hunting, but I have never hit anything yet. Now, Mr. Editor, I want to ask you a question. What is the price of the book, "The Amateur Trapper and Trap-Maker's Guide," by STANLEY HARDING?—and can it be bought at your office?—CHAS. P., *Corning, N. Y., November 30, 1875.*

We can supply the book, postage paid, at 50 cents.—ED.

From an Indiana Girl.

DEAR SIR:—This is the first time I ever wrote for your paper. My pa takes the RURAL and several other papers, but I like the RURAL the best of all. We have a gentle horse that my brother, five years old, and I can drive or ride. My grandpa is here on a visit from Iowa; he says I can harness and hitch up quicker than he can. Sometimes I drive to Laporte, three miles distant, alone, and get the mail and some groceries for our family, and when I get home I put my horse in the barn and take the harness off. I help to wash and iron, and sometimes churn and work over the butter. When ma goes visiting I keep house, as my only living sister is married and has gone away. When the little red ants get into my mother's cupboard, she rubs some kerosene on the shelves and they never come again.—FANNIE A. ANDREWS, *Laporte, Ind.*

From a New York Boy.

DEAR EDITOR:—I have long thought that I would write to you and let you know how we liked your paper, and tell you how many pets I have. I have got a splendid little rat dog, and he washes his face and dances and sneezes when I tell him to. And I have a splendid pet cat; she catches all the rats and mice around father's barn. I had a pet coon, but father killed him, and I felt very sorry. He was so mischievous that he would get up into the plum trees and pick plums to imitate our example. And now I must tell you how near the school-house is to me. It is only a few steps from our house, and I go to school every day and like my teacher very much. I am thirteen years old. I study reading, spelling, arithmetic, bookkeeping and geography.—WM. MCG., *Stanton Hill, N. Y.*

From a Pennsylvania Girl.

DEAR COUSINS:—Why do not some of you say something about flowers? Perhaps you do not like flowers. If that is so, it's very strange, for to my knowledge there are not many people who do not like flowers. Last summer I had a very nice flower garden; but this year I intend to have a nicer one, if possible. We could hardly do without flowers. How would the woods and fields look without them? Will not the Editor put his picture in the RURAL for a Christmas gift?—though it's rather late now. I would like very much to correspond with ROMPING BESSIE, MILLIE and WILD ROSE. Before I close I will say something in favor of the RURAL, which I think is a splendid paper. I like it best of all the papers we take, and we take a good many. If I see this in print, I might take courage and try again. My address is, LILLIE M. RUPLE, Washington, Pa.—WILD FERN.

The Puzzler.

MISCELLANEOUS ENIGMA.—No. 1.

I AM composed of 16 letters:
My 1, 3, 8, 14, is what boys kill birds with.
My 10, 3, 4, 9, 6, is a very useful animal.
My 7, 8, 13, 3, 12, is a very useful vehicle.
My 10, 3, 5 is a domestic animal.
My 1, 12, 8, 11 is an insect.
My 2, 8, 4 is a part of the head.
My 4, 11, 12, 1 is what ladies wear on their fingers.
My whole is the greatest general the Americans ever had.

☞ Answer in two weeks. J. H. R.

BIBLICAL ENIGMA.—No. 3.

I AM composed of 25 letters:
My 2, 1, 23, 15, 12, 6 is a symbolical name for Samaria.
My 5, 12, 15, 18, 13, 19 is a Jewish measure.
My 11, 7, 2, 17, 21, 13 is used is making bread.
My 16, 11, 10, 9, 4, 3 is a mountain in Palestine.
My 22, 10, 14, 8, 21, 13 was a judge of Israel.
My 25, 2, 3, 20, 12, 18 was miraculously destroyed for his sins.
My whole is a Bible command.

☞ Answer in two weeks. ISOLA.

CROSS-WORD ENIGMA.—No. 5.

My first is in send but not in go;
My second is in water but not in milk;
My third is in eat but not in drink;
My fourth is in add but not in subtract;
My fifth is in paper but not in book;
My sixth is in no but not in yes.
My whole is a country in Europe.

☞ Answer in two weeks. MATTIE E. S.

DOUBLE ACROSTIC.—No. 2.

1. A CITY in Russia. 2. A town in Pennsylvania. 3. A river in Austria. 4. A lake in Michigan. 5. A river in Spain. 6. A city in France. Initials, a distinguished mathematician and astronomer; finals, the greatestest of philosophers and mathematicians.

☞ Answer in two weeks. PAUL BOYTON.

WORD-SQUARE ENIGMA.—No. 2.

1. ROOM. 2. Pertaining to punishment. 3. To abolish. 4. To make. 5. A girl's name.

☞ Answer in two weeks. AZILE.

PUZZLER ANSWERS.—Feb. 5.

HISTORICAL ENIGMA No. 1.—"Falsehood has an exterior polished with a gaudy maze of treachery, but Truth has an interior gemmed with justice, virtue and zeal."

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.35, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

STARVING JURIES INTO VERDICTS.

MOST of the disrepute into which the jury system has fallen arises from absurd compliance with ancient precedents that long ago lost all reason for existing. The stolid ignorance required in a juryman is utterly without reason, and hinders rather than helps the course of justice. Of like character is the practice of confining juries in uncomfortable quarters and with insufficient food until they have agreed upon a verdict. The New Jersey jury which tried Landis for the killing of Uri Carruth, deliberated from Thursday until Saturday evening before bringing in their forced verdict of acquittal on the ground of insanity. They very soon reported that they could not agree, and asked to be discharged. Still later they reported that the disagreement was hopeless, but the judge refused to hear them. It was not until it seemed likely that they would be kept in close quarters on the plainest fare, over Sunday, that some of the Jerseymen yielded and an agreement was reached. Of what moral worth is a verdict gained by this system of coercion? Landis is legally free, but is it not evident that some at least of the jury having sworn to render the verdict according to the evidence, were induced to perjure themselves? Worse still—If there can be worse—the confidence of the people in the system of trial by jury is impaired. It used to be thought that the right of trial by jury was a main bulwark of popular liberties. Possibly its importance now is less than formerly; but we have still need to guard the sacredness of the jury system as the best safeguard against the insidious and always dangerous encroachments of arbitrary power. In just the proportion that juries become contemptible, the influence of the judge and of the Executive authority is magnified. Juries may often work harm to individuals; but they can rarely, except by abdicating their functions, effect any injury on the public welfare.

—Since the above was written we have received the following from a South Jersey correspondent relative to the Landis-Carruth murder trial:

"Another murder trial farce has been enacted—this time in New Jersey, the State so long quoted as a model in the way of wholesome laws and the vigorous and impartial enforcement of the same. A passionate bravo takes umbrage at a humorous squib published in a village paper, and arming himself with a loaded revolver, deliberately walks into the editor's office and demands satisfaction; but failing in getting such as accords with his views, shoots down the editor in cold blood. After several months twelve men are found who listen attentively for two weeks to all the facts of the case and then deliberately render a verdict that the cold-blooded murderer is *not guilty* by reason of insanity! Talk of the impartiality of Jersey justice! Why, the finding of the jury in the Stokes-Fisk case was the concentration of righteousness and wisdom in comparison with this last legal travesty."

MOODY AND SANKEY IN NEW YORK.

ONE of the notable events in this city last week was the advent of Moody and Sankey, the revivalists. The great Hippodrome, holding 7,000 people, and which has been fitted up expressly for these meetings, is filled nightly, while thousands, unable to get inside, flock into an adjoining hall holding 4,500, and are addressed by other speakers. At the first meeting, Monday evening, Feb. 7th, Mr. Moody spoke from the 27th verse of the first chapter of Corinthians:—"But God hath chosen the foolish things of the world to confound the wise; and God hath chosen the weak things of the world to confound the things which are mighty." Mr. Moody's entire career is illustrative of this text. His extraordinary success is not the result of great eloquence or great ability in any direction, but on the entire consecration of his life to God and sincere reliance upon Divine assistance. There have been hundreds of abler and more eloquent men who, lacking this consecration of self to Christ, have not accomplished a tithe of his work. Possibly if the learned and eloquent were equally devoted, there would still be the same preference for the preaching of this humble and unlettered man; for in his work at least, there can be no pretense that the results are not accomplished by Divine agency. There is in these meetings a marked absence of attempts to play upon the passions. All is calm and deliberate, and the truths of religion are enforced in the most simple and unpretending manner.

Mr. Sankey's singing is doubtless an attraction to thousands; but this too, like the preaching, is marked less by wonderful skill than by the evident earnestness and sincerity of the man. Mr. Sankey insists that all his choir shall be personal Christians; and it must be confessed that this rather novel method of making up a choir produces more marked religious results than the common plan of selecting singers for professional ability, without regard to character. Altogether, the two men are well matched, and their combined force, working in harmony as they do, has created the most remarkable religious awakening known since the days of Whitfield.

DEATH OF REVERDY JOHNSON.

THURSDAY evening, Feb. 18, REVERDY JOHNSON of Maryland, long a Senator from that State, and some years ago minister to England, was found dead in the grounds adjoining the executive mansion of the Governor of Maryland in Annapolis. Mr. Johnson was born May 21st 1796, and was consequently nearly eighty years old. He belonged to the old school of statesmanship, was a cautious, moderate Whig in 1844, when he was elected to the Senate, was a member of Gen. Taylor's Cabinet, but resigned on the accession of Fillmore. In 1863 Mr. Johnson was again a U. S. Senator, giving a hearty support to the war measures of the Government. President Johnson appointed him minister to England but he retired in 1869 when Mr. Motley succeeded him. Since then he has lived in retirement, only occasionally giving his views on public affairs which were always marked by good sense.

Mr. Johnson's death was mysterious. He had been attending a dinner given by the Governor of the State, went out of doors while his friends were enjoying a smoke, and was found near the door with some severe gashes in his head, caused as is supposed by a fall against the projecting corner of the building. He was bleeding profusely and was nearly or quite dead when found. Until the accident he was enjoying excellent health.

A GREAT FIRE AND LOSS OF LIFE.

TUESDAY evening, Feb. 8, a fire was discovered at No. 8 Crosby St., near Broadway, New York. The flames soon spread across the street and through the buildings No.'s 444 and 446, Broadway, which were speedily destroyed. In little more than an hour after the fire was seen, sections of walls began to fall, and in two of these many firemen were more or less injured; five were partially buried under piles of brick and mortar, and of these four have died, two being dead when taken from the ruins. The dead and injured were taken to a saloon and cared for as well as possible. Great excitement prevailed. The fire was gotten under control about ten o'clock; but not until it had burned out most of the block on the east side of Broadway between Howard and Grand Streets. The Continental Hotel was destroyed; also a large number of jobbing establishments of various kinds. The loss is estimated at $4,500,000 and the insurance at $2,500,000. At one time it was feared that the fire would spread and burn out the heart of the city. Had there been a severe wind, or cold weather, the damage would certainly have been much greater than it was.

HOME NEWS PARAGRAPHS.

ON the 22d inst. Republican State Conventions will be held in Indiana, Illinois, and Wisconsin. That of Vermont is to be held March 29.

Dr. Edward Straznicky, Superintendent of the Astor Library, died on the evening of the 9th inst., at Montclair, N. J. He was a native of Austria, and came to Pennsylvania about 35 years ago.

The Bank of Commerce of New London, Conn., was robbed one night last week of $21,500, the burglars dropping $500,000 in bonds in their flight.

At New Haven, Conn., Feb. 10, James, John and Minnie Bates, young children of Andrew Bates, a mechanic, were drowned in Lake Whitney by breaking through the ice. Their mother also broke through, but was rescued.

At the meeting of the Board of Appeals of the National Trotting Association held in New York City last week, Col. C. W. Wooley of Ohio, was elected President; C. W. Hutchinson of Utica, First Vice-President; Judge Grant of Iowa, Second Vice-President; and Thomas J. Vail of Hartford, Secretary.

The revival meetings in the Universalist Church in Bergen, N. J., where the Rev. Phœbe A. Hanaford officiates, have been fervent. George Fielding, the sexton, has been thoroughly wrapped up in the progress of the meetings until the constant strain on his mind has driven him insane, and he is in strict confinement.

Mr. Beeler and Miss Beek of Louisville, have eloped. Their ages are respectively fifteen and thirteen. The parents, in tracing the pair, have learned of application to many justices and ministers to marry them, but in every instance their youthfulness was against them. They have not yet been overtaken but at last accounts were going toward Missouri, and trying hard to get somebody to perform the ceremony.

Under the Game laws of this State venison of any kind is now out of season, and the New York Association for the Protection of Game gives notice that it will prosecute any persons found with it in their possession, that being sufficient legal evidence of transgression.

A lamp on a table in a hotel at Bennington, Vt., exploded recently while no person was in the room, setting fire to the tablecloth and then to the table itself. The heat of the flames increased until it cracked open a globe filled with water for gold fish which was standing upon the table. The water extinguished the flames and thus probably saved the building from destruction.

Fifty years ago all the Baptists in Ohio dined together at one family table, and now they number 43,000.

Richmond, Virginia, is probably without a parallel in the country in its proportion of its church members to the inhabitants. Of its population of 60,000 there are 24,838 church members, which must be a large proportion of those who are not children. Half of these are Baptists.

When Oglethorpe was Governor of the province of Georgia, over one hundred and thirty years ago, there were no Methodists, but 1,000 members of the church of England. Now there are 150,000 Methodists and not quite 500 Episcopalians. The Baptists about equal the Methodists in numbers. These two are the leading denominations in the State.

Senator Ferry of Connecticut, died before he could deliver his prepared eulogy of Representative Strong of the same State, and Representative Starkweather died before he could deliver his eulogy of Ferry. And now tributes of respect are being paid to the lamented Starkweather by his colleagues, one of whom last week read his posthumous speech over the death of Ferry.

The Mayor of New Haven suggests in his annual message that the Rev. Dr. Leonard Bacon be invited to prepare a general history of that city from its settlement down to the present time.

A sacramento beet-sugar factory turned out 3,000,000 pounds of white sugar in 1875. The beets yield 13¼ per cent. of sugar—5½ per cent. more than the average yield of Europe.

The Piute Indians of Nevada, do not gain by contact with civilization. They beg in the villages in the daytime, and at night return to their wickiups, which are huts made of brush and old gunnysacks, warmed only by sagebrush fires. They do not seem to think of bettering their condition.

A burglar named Peter Curley, now in jail in Montpelier, Vt., for leading the Barre, Mass., bank robbers, has got himself in an unusual difficulty. He has lived and grown wealthy during the past few years by committing burglaries; but heretofore he has had the luck to secure valuable booty, by dividing which with his victims he has been allowed to go scot free. It is so much easier for bank officials to give up one-third, or even more, of the money or negotiable bonds stolen than to go into a long and possibly fruitless effort to secure the whole, that burglars have learned to look on this as the natural and safe way of "realizing" on their "business enterprises." They frequently take a great number of papers which can be of no use to them, except as enabling them to dictate a better compromise with those they have robbed. In this case, however, Mr. Curley made the serious mistake of not hauling anything, and the bank officials cannot decently propose a compromise. The burglar has money enough, but there seems to be a prejudice against buying off prosecution unless it is with property stolen directly from the prosecutor. There is a fine moral to this business of compounding felonies with burglars, but it is so obvious that it needs not to be pointed out.

James Horner of Perry Co., Tenn., is one of eight children. At eighteen years of age he was six feet tall and weighed 180 lbs. At twenty-one he was six inches taller and weighed 210 lbs. This was ten years ago, and he has been growing ever since—is now seven feet nine inches high, and grows about two inches taller every year. He will go to the Centennial, of course.

The keeper of the jail in Springfield, Ill., has opened the prison doors and let out the convicts, some 20 in number, because there was no money in the city treasury to pay their board bill.

A family in Bangor, Me., were very comfortably clothed and provided for by a charitable society, and the next day the three children, dressed in their new garments, went to have their photographs taken.

Senator Christiancy of Michigan, was married in Washington, Feb. 8, to Miss Lillie Lugerbeel, lately a clerk in the U. S. Treasury Department. Senator Ferry of Michigan officiated as groomsman. Senator Christiancy is a widower of 64, and his bride is said to be 20.

Mr. Peter Cooper is visiting his son-in-law, Congressman Hewitt, at Washington. He was 85 years old on Saturday week.

Not 100,000 tons of ice of the usual 2,000,000 are yet cut on the Hudson.

The funeral of Reverdy Johnson took place at Baltimore on Sunday last, and was largely attended.

Of the 172 churches invited to the Plymouth Advisory Council 117 have appointed delegates, and 26 have declined the invitation. The Council opened on the 15th inst.

Active search is being made for Winslow in Europe.

FOREIGN NOTES.

A STEAMER has been chartered to sail from Genoa on June 1, with Italian exhibitors and visitors to the Centennial and every berth and inch of available space for freight have already been engaged. Another one is to be chartered.

In Scotland it is reported the Baptists have more than doubled their numbers in the past six years. They have now seventy churches and three thousand members. The increase the past year was 700.

The largest Sunday-school in the world is at Stockport, England, which has in one room 424, teachers and 3,614 scholars. With the branch schools the total membership is 434 teachers and 4,792 scholars.

The Board of Trade inquiry into the loss of the American ship Harvest Queen, Capt. Janssen, off Waterford, Ireland, on the 31st of January, which has been proceeding several days at London came to an end Feb. 9. The Board find that the White Star steamship Adriatic sunk her, and that the captain of the steamer should have reported the matter to the British Consul on his arrival at New York, and left the bows of the Adriatic untouched until they had been inspected by the Consul. Saving this, the Captain is acquitted of blame and his certificate restored to him. The first and third officers are censured for withholding the information.

The English Government has sent to its diplomatic representatives abroad an exhaustive confidential memorandum upon the condition of Cuba. The circular describes the causes of the insurrection, the character of its leaders, and the reforms which will be introduced when it is terminated. The purpose of these reforms will be to assimilate the Government of the colonies to that of Spain by establishing common liberties and representation of the colonies in the Cortes.

An eminent English chemist, Dr. Bathurst Woodman, calls attention to the fact that ginger beer, though usually considered a very innocent drink, contains a percentage of alcohol about half as large as that found in the malt liquors in common use among the middle class of society in England, and equal to that in many of the cheaper ales made in that country, and the beer drank in Germany and other parts of the Continent.

The London World describes a new device for burying the dead, as follows:—You are placed in a glass box, to the top of which is affixed a metal rod. As soon as the earth is filled in a battery is connected with the rod, and an electric shock shatters the coffin into a thousand pieces, thus allowing the earth to press upon the dear departed and allowing him to return to dust even quicker than in one of Mr. Seymour Haden's wicker baskets.

Twelve hundred candidates for the Chamber of Deputies, at Paris, are already in the field, and 500 more are expected.

The Morning Hour (London) says that Sir Henry Peek, at the annual meeting of the Sutton Conservative Association, on the evening of Feb. 2d announced that her Royal Highness the Princess Beatrice, the youngest daughter of Queen Victoria, is engaged to Prince Louis of Battenburg, now in India with the Prince of Wales, and that Parliament at the coming session will be asked to grant a dowry.

A despatch of Feb. 4th from Vienna to the Standard (London) says there was fighting Feb. 2d on the Croatian and Bosnian frontier. The Turks pursued them and attacked the Croatian village of Topola. At last accounts the fighting continued. The Austrian authorities have arrested and disarmed the insurgent leader Hubmayer and forty of his men.

Great preparations are making at Naples for the carnival, which will last from the 20th to the 28th of Februrary—the first since the overthrow of the Bourbons. One hundred thousand francs have been subscribed, and the names of the members of the leading families and nobility, are on the Committee of Arrangements. Seats on the platforms in the Place du Plebiscite are held at 150 francs for the week. Windows in the Via Roma bring from four to twelve hundred francs. It is believed that the Chief of Police will prohibit the masked ball at the San Carlo Theater on account of the danger to the theater and the adjacent palace from fire.

THE SEASON, CROPS, PRICES, ETC.

Lyndonville, Caledonia Co., Vt., Feb. 4.—Weather fair and moderate. The winter thus far has been unusually mild. Snow storms have been quite frequent; but every storm of late has terminated with rain, so that the depth of snow is quite light—scarcely a foot on the average. A very few cold nights during the past two months; but much of the time has been really spring-like—more like April than mid-winter in Northern Vermont. The hay crop the past season was very good, and if the present favorable weather continues more or less hay will be summered over. Farm stock is looking well. Hay and grain plentiful. Hay, $12 per ton; oats, 50c. per bushel; Corn, 80c.—I. W. S.

Fulton Station, Fulton Co., Ky., Feb. 7.—We are having a great deal of rainy weather in this section. Six inches of snow fell on the 3d inst. On the 4th the thermometer was at zero for six hours, the lowest point by ten degrees this winter. Up to that time the weather had been unusually mild. Farmers are hurrying off their tobacco, it being in good demand at 6 to 11c. Plenty of feed in the country, consequently stock looks well.—F. P. H.

Clark, Mercer Co., Pa., Feb. 10.—This has so far been a very mild winter in this section. I saw dandelions out on the 2d of January. Business improving. Wheat, $1.40@1.50; corn, 35@40c.; oats, 40c. Hay and feed of all kinds low. Horses low and dull sales. Cattle, good, sell at 4@6c. ₰ lb. Cows will be a good price in the spring. Every one for the Centennial. S. C. R.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 12, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	58,241	Rice, bbls	1,153
Whisky	2,329	Cut meats, pkgs	13,707
Corn meal, bbls	497	Lard, pkgs	8,619
Corn meal, bags	4,995	Tar, bbls	791
Wheat, bush	117,310	Tobacco, hhds	1,185
Corn, bush	158,085	do. cases	3,450
Oats, bush	111,957	Butter, pkgs	17,207
Rye, bush	6,574	Cheese, bxs	10,868
Malt, bush	11,165	Cotton, bales	18,823
Barley, bush	49,500	Rosin	5,761
Beans, bbls	2,799	Spts. turp., bbls	805
Grass seed, bags	6,058	Dried Fruits, pkgs	319
Ashes, pkgs	132	Eggs, bbls	8,551
Beef, pkgs	1,523	Peanuts, bags	1,290
Peas, bush	7,840	Dressed Hogs	2,293
Wool, bales	2,495	Oil Cake, pkgs	2,273
Hops, bales	3,798	Leather, sides	86,402
Pork, bbls	4,685		

BEANS AND PEAS.—Medium beans remain in the flat condition that has characterized them for so many weeks. Pea beans have not renewed any of the Eastern demand that has heretofore made them a specialty. Marrows have sold well for export, but the wholesale orders are about filled. The late free sales have left prices higher. Kidneys are dull for both red and white. With lighter supplies of Canadian, peas are firmer as receipts are lighter, and the outgo has been unusually heavy this season. Lima beans do not sell. Green peas are higher for prime.

We quote Beans, pea, new, prime, $1.40@1.45; other, 1.20@1.30; medium, new, $1.35@1.40, fair to good, $1.15@1.30; very poor, 50@90c.; marrow, new, prime, $1.75@1.81; other, $1.45@1.65 white kidney, prime, $1.75@1.85; fair to good, $1.50@1.70; red kidney, new, prime, $1.50@1.60; fair to good, $1.30@1.45; California Lima, choice, $3.50@4.00. Peas, Canadian, bbls., new duty paid, $1.25@1.27; bulk, in bond, $1.03@1.05; green new, ₱ bush., $1.55@1.65; Southern B. E., ₱ 2 bush. bag, $3.10@3.15.

Exports of beans since Jan. 1st, 5,173 bbls.; of peas, 114,325 bush.

BEESWAX.—Exports since Jan. 1, 16,435 lbs.; same time last year, 1,915 do.; for the week, 1,501 lbs. Export and bleaching demand good. Sales are at 32@32½c. for pure Western, and 32½@33c. for Southern.

BROOM CORN.—Market quiet. Prime sells well. We quote Brush, short green, 10@11c.; hurl, green, 8½@10c.; green, medium, 5@7c.; red and red-tipped, 3@4c.

BUTTER.—A long steady demand for fine State during the fall, together with the steady drain of more than two winter months, leaves us apparently short of choice stock. There may yet be many prime dairies to come forward, but it is improbable that after the large use of the fancy end of the crop, extra lines can be liberally replaced. During the past week top qualities have been so limited in supply that daily competition to secure them among high priced grocers has run prices up to 31c. and in some cases higher. This of course, if only for the time being, promotes next table grades and to some degree sends a chord of firmness through all useful lines. Latterly receipts of State are larger and a few days may change the firm condition. Western is considerably benefited by the strong feeling in State, and supplies have run out well at 20@24c. and with 25@26c. paid for nice grocery parcels. Rolls thus far have felt the new improvement. We clip the following comparisons from the Producer's Price Current:

	Receipts, pkgs.	Exports, lb.
June 1, '75, to Feb. 1, '76	625,987	28,136
June 1, '74, to Feb. 1, '75	734,235	39,757
June 1, '73, to Feb. 1, '74	760,463	25,623
June 1, '72, to Feb. 1, '73	583,412	39,215
June 1, '71, to Feb. 1, '72	536,780	57,751
June 1, '70, to Feb. 1, '71	402,657	11,011

State dairies entire, extra, 31@33c.; entire, good to prime, 28@30c.; fair to good, 25@27c; firkins, selected fresh, 31@32c.; good to prime, 28@29c., fair to good, 24@25c.; half-firkin tubs, selected, 33@34c.; good to prime, 31@33c.; fair to good, 27@30c.; poor to fair, 24@27c.; State, Welsh, tubs, fall made, 30@31c.; dairies, 27@28c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 166@24c.; Western, dairy tubs, selected, 26@27c.; good to prime, 24@26c.; tubs selected fresh, 26@27c.; good to prime, fresh, 23@25c.; fair to good, fresh, 21@23c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 16@20c. Roll butter, good to prime, 19@21c.; fair to good, 16@18c., common, 14c.

CHEESE.—There is a fair inquiry from shippers and home trade; market strong; stocks not oppressive. New State factory, fancy, 13¾@13¾c.; fine, 12¾c.; do. good to prime, 11¾@12¼c.; fair to good, 10@11¾c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12¾c.; good to prime, 10½@11¾c.; fair to good, 9¾@10½c. Western factory, cheddar, fine, 12¾@12¾c.; good to prime, 11@13c., flat fine, 12¾@13c; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c; pineapple, 16@18c. English dairy, Connecticut, 13@13½c., do. State, 16@18c.

Since our last the Marshfield factory of 3,000 September sold at 13¾c. for export. A strong competition added somewhat to the price, still there is now no heavy abundance of extra either here or in the interior, and the market is tending higher.

The Producers' Price Current gives the following comparative receipts and exports from June 1st:

	Receipts, pkgs.	Exports, lb.
June 1, '75, to February 1, '76	2,177,367	82,261,854
June 1, '74, to February 1, '75	1,827,405	83,378,143
June 1, '73, to February 1, '74	1,513,638	80,574,206
June 1, '72, to February 1, '73	1,678,847	66,242,768
June 1, '71, to Fepruary 1, '72	1,358,870	61,212,588
June 1, '70, to February 1, '71	1,349,918	55,253,336

COTTON.—Has been moving off slowly with quotations weak. The closing prices are: for Febenary, 12 29-32@12 15-16c.; March, 13 3-32@13¼c.; April, 13 11-32@13¾c.; May, 13 19-32c.; June, 13 25-32@13 15-16c.; July, 13 31-32@14c.; August, 11 1-16@11 3-32c.

Quotations for spot cotton, based on American standard of classification:

DOMESTIC DRIED FRUITS.—Apples are less freely dealt in, but stocks are considered moderate and prices are held firmly. Peaches are dull. Blackberries are in light supply and firmly held.

Apples—State, sliced, 10@10½c.; quarters, 9½@9¾c.; Western quarters, 9c.; Southern sliced, 1875 crop, 10¾c. for prime, and fancy 12c.; Tennessee qrs., 8¾@8¾c. Blackberries, new, 12 @ c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 13c. for halves, and 10½@11c. for quarters. Plums, 20c. Raspberries, 27@28c. Cherries, 22@23c. Peaches, evaporated halves, 12@13c.; quarters, 10½@11c.

EGGS.—Receipts are lighter; still they are heavy for the season. Prices have declined more or less every day, and all holders are anxious sellers at the low quotations.

We quote near points, 20c.; State and Pennsylvania, 19c; Canadian, choice, 19c.; Western, do., 19c.; other Western, 18@19c.; Southern, 18c.; Limed, 15c., full loss off.

FLOUR.—Exporters are purchasing moderately, while the home trade is light, but with the higher figures for wheat the market is well sustained.

Superfine State, $4.30@4.35; extra do., $5.00@5.80; superfine Western, $4.30@4.65; extra do., $5.00@6.00; No. 2, $3.25@4.25 extra round-hoop Ohio, $5.00@5.35; trade brands do., $5.40@7.75; white wheat extras, $6.05@7.00; St. Louis, $5.30@9.00; City Mills extra, $5.00@6.50; Southern at $4.15@4.10 for superfine; $4.80@8.25 for poor to choice shipping extras; $6.30@8.75 for trade and family brands. Rye, $4@5.05.

CORN MEAL.—Western yellow quoted at $2.85@3.25; do. white, $2.75@3.25; Jersey and Penn., $2.90@3.25.

FRESH FRUITS.—Apples are not selling much above retail wants. Red fruit fairly firm; greening nice, when faultless. Russets not showing. A few fine Catawba grapes for the season quoted at 8@9c. Florida oranges are in better order and bring high prices. Cranberries were firm and not likely to recede. Peanuts are easy. Prime pecans in good demand. We quote:

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; other $1.50@2. Cranberries—Jersey, choice, bush. crates, full measure, $3.50@3.75; good to prime, $2.25@3.50; made bbls., $11@12.50. Nuts—Peanuts, Virginia, $1.01@1.05; do. Wilmington, $1.75@1.80; do. Tennessee, 75@90c.; Hickory nuts, $1@1.25. Black walnuts, 50c. Pecans, 12@15c.

FURS AND SKINS.—There is no motion in stock, and prices are nominal. The receipts are light and not heavy this season. The coming March sale abroad will conclude all that will bear importantly upon settled prices for stock.

FEATHERS.—The market is easy at 50@57c. for prime live geese. Western 30@45c. for mixed. Hen and Turkey feathers not wanted.

GINSENG.—Southern $1.25@1.30. Western, $1.20@1.25.

GRAIN.—For wheat the markets abroad are strong, and prices here are in sympathy, with a larger export trade; latest sales are at $1.26 for prime No. 2 Milwaukee spring; $1.14@1.15 for No. 3 Milwaukee spring; $1.12@1.13 for ungraded Milwaukee spring, afloat; $1.34¾@1.36 for No. 1 spring; $1 10@1.11 for No. 3 Chicago spring; $1.06@1.07 for rejected spring; $1.04 for inferior spring; $1.31 for white Canada in bond; $1.23 for No. 3 New York winter, and $1.47 for amber Pennsylvania; $1.21@1.47 for winter red and amber; $1.33@1.35 for white and $1.44@1.40 for No. 1 spring. Rye at 90@92½c. for State, and 86@88c. for Western. Barley at $1 for four-rowed and 83c. for two-rowed State. Barley malt at $1.15@1.45 for Canada; 90c.@$1.10 for two-rowed State; $1.10@1.25 for four-rowed State. Corn is higher and fairly active. Sales at 64¾@64¾c. for new mixed Western; 64¾@65c. for new yellow Western; 65c. for new yellow Southern. Oats have a moderate jobbing demand. Sales, at 48@50c. for prime mixed Western.

HAY AND STRAW.—Offerings are larger and prices are easier, with a demand chiefly for prime qualities. Bale hay is quoted:—Shipping, 75@80c.; retail qualities, $1.00@1.10; clover, 65@75c.; salt, 60@70c. Straw is quoted at $1.05@1.15 for long rye; 80@85c. for short rye; 75@80c. for oat.

Exports of hay since Jan. 1st, 1,372 bales; same time last year, 3,642.

HONEY unchanged.

Exporters are operating liberally, and the local business is fair with prices on choice stock strong.

New York State, 12@17c.; Eastern, 10@15c.; Wisconsins, 10@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias, 17@20c.

MILK.—The farmers' price for Jan. ranged at 3¾@4½c. per quart. Prices at the platforms during the week ranged at $1.75@2.75, closing weak.

POULTRY AND GAME.—Dressed poultry is not abundant, but buyers do not make regular daily visits, and prices are consequently kept tame.

Turkeys, N. J., choice, 17@18c.; do. other, 14@16c.; State, prime, 16@18c.; do. other, 14@15c.; Western, prime, 15@16c.; other, 10@13c. Chickens, N. J., prime, 17@18c.; other, 13@15c. State, prime, 14@16c.; State, 13@14c.; Western, prime, 14@15c.; do. other, 10@12c. Fowls, choice, 14@15c. Ducks, N. J., 10@12c.; State and Western, 17@18c.; Geese, Western, 10@20c. Capons, 22c.; slips, 23@25c.; Philadelphia chicks, 19@20c.; turkeys, 16@20c.

Live poultry is in fair demand; geese doing better. Turkeys, Jersey, ₱ lb., 15c.; do. Western, 12@15c.; Geese, Jersey, ₱ pair, $2.50@3; do. Western, $1.50@1.75; ducks, Western, ₱ lb., 65@75c.; ducks, Jersey, ₱ pair, $1@1.25; fowls and chickens, State and Jersey, ₱ lb., 13@14c.; do. Western, 12@14c.; roosters, 8@10c.

Game is easier; the late high prices restricted sales. Stock reduced to few items. A few Kansas wild pigeons have been quoted at $2.25 ₱ doz.

Quail, trapped, prime, ₱ doz., $3.25@3.50; soft, $1.00@2.00. Grouse, prime, ₱ pair, $1.12@1.25; drawn, 90@1.00. Partridges, choice, ₱ pair, $1.20@1.25; Hares, ₱ pair, 20@30c. Rabbits, ₱ pair, 30@35c. Ducks, canvas back, ₱ pair, $1.50@2.50; redhead, $1.25@1.50; common, 50@75c.

PROVISIONS.—Mess pork is higher, with an active inquiry. Bacon and lard have increased shipping demand, with the market more favorable to the selling interest. Pork quoted $21.75@22 for spot lots; $21.85@21.95 for Feb.; $21.90@22 for March; $22 for April; $22.15@22.15 for May. Dressed hogs at 9¾@9¾c. for Western long clear; 11¾@12c. for city do. Lard at 12-95@13c. for cash lots; 13c. for Feb.; 13-07½c. for March; 13-25c for April; 13-37½c. for May; 13-50c. for June. Stearine at 14½c. for Western. Tallow at 95-16 for prime. Beef hams at $22@22.50 for Southern and $24@25 for Western. Beef—New extra mess, $12@12.50; do. plain mess, $11@11.50; do. tierced at $23 for prime mess, and $25 for india mess. City extra India mess, $31.50@32.50 Old extra mess, $11.50, and $10.50 for plain mess; packet, $15.50@16.

SEED.—Clover is lower with larger supplies. Western quoted 13¾@14c. for fair to prime.

VEGETABLES.—Exports of potatoes since Jan. 1st 26,674 bbls., same time last year, 15,232. The market for all classes of vegetables is quiet. Potatoes are threatened a loss. Some samples of Bermuda produce have arrived thus early. Potatoes quoted at $7@8 per bbl. and Tomatoes $3 per 8 quart box.

Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.50@1.75; Prince Alberts, $1.00@1.25; Peerless, 65c.@$1.00. Sweet potatoes, $2.25@3.50. Cabbages, ₱ 100, $3@5; red, $6@10. Cauliflower, bbl., $2@5. Squash, Marrow, bbl., 50@75c.; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@3.00. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00. Baltimore spinach, ₱ bbl., $1.50@2.

TOBACCO.—Seed leaf has been taken freely by exporters, the demand largely for the old crop, which has brought full prices. Western leaf has a slow sale.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Feb. 12, 1876.

THERE is a much better feeling among dairymen in regard to the future, and the market is stronger than for several weeks past. Buyers do not offer any better prices, but there is more inquiry for cheese and more eagerness to handle goods. Fine cheese is held firmly, with the expectation that 14c. will be reached, and the recent advices from abroad seem to indicate that an advance in prices will go to that figure.

"Late ends" of factories may be quoted at 11@12¾c., and fine September at 13c. Farm dairies continue to be brought forward in small parcels, but being rather inferior in quality. Sales have been made at 7@10c., according to quality. We hear of no transactions in fine factory cheese.

Winter butter sells at 13@26c. No grass make in market.

We have advices from Europe up to the latter part of January. Our London correspondent says:

Large transactions in American cheese are reported, especially in firm, clean, solid September make. The stock in fine English cheese is small. The prices are as follows:

American extra, 64@65s.; fine, 63@64s.; good, 57@60s.; common, 42@50s. English cheddar brings 80@90s.; Wiltshire double, 70@78s.; Cheshire medium, 64@66s.; fine, 76@82s.; Scotch, 70@74s. Dutch cheese—Edams, 75s. ₱ cwt.

Fine descriptions of butter are scarce, and other qualities are slow though pressed at low rates, good substitutes being preferred. The quotations are as follows:

Dorsets, 100s.; Jersey, 136s.; Friesland, 120@120s.; Swedish, 106s.; Normandy extra, 112@116s.; American and Canadian, 90@120s., ₱ cwt.

Oleomargarine or artificial butter brings 90@120s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Feb. 12, 1876.

RECEIPTS OF LIVE STOCK.

BEEVES.—On last Monday forenoon trade in horned cattle opened slow, and the markets closed weak, with several carloads unsold. The herds to hand were in the aggregate coarse and inferior to the quality in demand. Prices were 7¾@13¾c. ₱ lb.; weights, 5@14 cwt. Wednesday trade dull at 7¾@12¾c. ₱ lb; weights, 5@9¾ cwt. Thursday, sales were at 7¾@12c. ₱ lb.; weights, 4@10 cwt. Friday, the markets closed weak at 9@12¾c. ₱ lb.; weights, 5¾@9 cwt. From 53@58 lbs., net, has been allowed to the cwt. Dry cows and poor quality heifers at $37.50 ₱ head. Native steers sold at 8@12¾c. ₱ lb.; grades do. at 12¾@13¾c. Spanish cattle, in extremely light arrivals, sold at 7¾@8c. Oxen at 8@12¾c. Mixed herds, 9¾@13c. Bulls, on live weight, quality very rough, at 4@4¾c.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13¾	12 @13¾
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	7¾@ 9¾	7¾@ 9¾
Gen. selling rates	9¾@11	10 @11

MILCH COWS.—Sales moderately easy at $45@75 ₱ head for ordinary quality family cows. Extreme range of prices, $22@92 ₱ head. Five cows sold at $50@75 ₱ head; 9 do. at $45@75 ₱ head; 22 do. at $55@65 ₱ head; 3 do. at $80@92 ₱ head—calves always included.

VEALS AND CALVES.—Smooth quality veals scarce and in brisk demand at 9@11c. ₱ lb. Grass calves very slow, quality being rough and poor; sale at 4@4¾c. Quotations exclusively from New York State and Pennsylvania.

SHEEP AND LAMBS.—Monday trade opened slow with general sales effected in large lots. Sheep sold at 5¾@8c.; lambs, 7¾c. Wednesday, the same tone of trade; sheep sold at 5¾@7c.; lambs not quoted. Thursday, sales slow at 5@7¾c. Friday, the markets closed dull at 5@7c. for sheep; lambs not on sale. State ewes sold at 5c. ₱ lb.; sheep, 5@8c.; Kentucky, 5¾@8¾c.; Michigan, 5¾@5¾c.; Ohio, 6¾@7¾c.; Illinois, 5¾@7¾c.; Canada, 7¾c.; State lambs, 7¾@8c.; Canada, 8c.

HOGS.—Wednesday last, 250 Ohio hogs, five weight 193 lbs, sent ₱ head, sold at 8¾c. ₱ lb.; no other sales. City dressed firm but slow at 9¾@10¾c. General sales of hogs 240 lbs. ₱ head, 9¾c.; 150 lbs. down, ₱ head, 10¾@10¾c.

HORSE MARKET.—City trade continues slow, the quality of the horses dealt in being generally very inferior. Twenty-nine head of poor quality light harness horses sold at $2@69 ₱ head; 41 ordinary do., $100@175; 9 roadsters with fair trotting action, $275@375 ₱ head; 2 pairs stylish carriage horses, $1,000@1,200 ₱ pair; 7 pairs course quality heavy draft horses, $300@450 ₱ pair; choice quality in demand, but not on sale. Fifteen horses arrived ₱ Erie Railroad, via Oak Cliff Station.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

NEWS CONDENSER.

— Rochester complains of gas extortion.

— Fox hunting is all the rage in Indiana.

— California's wool clip will reach 50,000,000 lbs. next season.

— A Baltimorean has taken one newspaper for fifty-four years.

— The Boston and Albany Railroad have abolished free passes.

— Antwerp is preparing to celebrate the centenary birth of Rubens.

— Maryland has 1,846 public schools, which are attended by 143,003 children.

— Last season 337 car loads of potatoes were shipped from Canandaigua, N. Y.

— Governors of Illinois have pardoned eight hundred and twenty-four criminals.

— Since November last, 413 books have been added to the Poughkeepsie city library.

— The population of California increased 69,172 last year, of which 18,144 were Chinese.

— The Brooklyn police recovered property valued at $7,324.18 during the month of January.

— The United States sent $95,678 worth of printed books to England during the fiscal year of 1874-75.

— The Round Lake, N. Y., mineral water borers have reached a depth of 1,000 feet, but find no water.

— The total losses by the great Broadway fire were computed at $2,521,750, and the insurance at $2,194,200.

— A bill for a State Constitutional Convention, to be held in March, 1877, has passed the Georgia Assembly.

— They have established a regular shop in Vienna for the sale of horse flesh. The government authorizes it.

— The Trinity College Boat Club at Hartford, Conn., has resolved not to send a university crew to Saratoga this year.

— The five weeks' suspension of work in the coal mines, which was inaugurated Jan. 9, turns over to idleness 60,000 men.

— Small-pox is raging so severely at La Paz, Lower California, that the regular steamers have ceased stopping there.

— Norwich, Conn., has subsidized a man to the extent of $15,000 to enable him to open a sewing machine factory there.

— The Bristol, England, School Board has resolved to introduce cookery as a subject of instruction in female schools.

— Ice men are cutting ice while the moon shines, on the Hudson. Over 2,000,000 tons will be gathered, O. Prob. willing.

— What's in a name, again? — One Thomas Miscreant has been arrested in Corpus Christi, Tex., for horse stealing.

— Sixty female operatives in a Lynn, Mass., shoe manufactory have struck. The "Daughters of St. Crispin" sustain them.

E. A. Packer & Co., and other large commission houses of N. Y. City, have suspended, with aggregate liabilities of $800,000.

— There are eight complete Bessemer steel establishments in the United States, and three more are in progress of construction.

— The Christmas number of the London Graphic cost $40,000 before a copy was printed. The first edition consisted of 250,000 copies.

— Under the Iowa civil damage law the wives of drunkards in Sioux city have sued liquor dealers for sums amounting in all to $60,000.

One who understands the assistant plan of canvassing preferred. Give age, experience, &c. W. J. HOLLAND, Springfield, Mass.

Sewing Machines.

"GENERAL FAVORITE" No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY, HARTFORD, CONN.

Agents Wanted.

1776 1876 CENTENNIAL MEDALS.

PERSONAL ITEMS.

CHARLES O'CONOR is able to ride out.

ANNA DICKINSON calls her new book "A Paying Investment."

"LORD DUNDREARY" Sothern arrived in the Celtic, Feb. 7.

MRS. S. J. HALE puts in a claim of authorship to "Mary had a little lamb."

A GENTLEMAN of Philadelphia has sent Walt Whitman a present of $100.

MR. LONGFELLOW'S "Evangeline" has been translated into Portuguese.

THE 66th anniversary of the birthday of Abraham Lincoln occurred on Feb. 12.

A BUST of President Parkman has been presented to the Massachusetts Horticultural Society.

MRS. THOMAS, wife of the dynamite plotter, arrived in New York by the Wieland, recently.

A SISTER of Gen. Meade has received a position as copyist in the Pension Office in Washington.

HORACE GREELEY'S famous stage-driver, Hank Monk, is now old, poor and well stricken with gin.

LYDIA SHERMAN, the convicted wholesale poisoner, is said to be dying in the Connecticut State prison.

MEISSONIER was appointed President of the Academy of the Fine Arts of Paris at its recent sitting.

DR. KENEALLY, it is announced, will soon begin a series of religious services for the people in London.

J. G. WHITTIER will contribute to the April number of St. Nicholas a poem called "The Pressed Gentian."

JOSE JORDANAY MORERA, the director of Agriculture of the Spanish commission to the Centennial has arrived.

M. J. ROUSSEAU has been commissioned by the Belgian Government to prepare a history of Flemish sculpture.

MR. ROBT. BROWNING'S son, who took to painting two years ago, is said to show much progress in his chosen profession.

ADMIRAL KRABBE, Russian minister of marine, is dead. Vice-Admiral Lessowski will probably be his successor in office.

PHILIP PHILLIPS, the singing evangelist, has been holding services in Galle, Colombo, and other towns of Ceylon.

THERE is quite a sensation in Newburyport, Mass., over the marriage of James Parton, the author, to his stepdaughter.

IN order to complete his line estate at Friedrickruhe, in Lauenburg, Bismarck has bought the chateau of Reinbeck for $140,000.

F. B. CARPENTER is at present painting a full-length likeness of the late Ezra Cornell, the founder of the Cornell University.

THE Marquis of Lorne and the Princess Louise will be the guests of Sir Edward Thornton during their visit to the Centennial Exhibition.

MRS. D. G. CROLY, (Jenny June) President of the Sorosis, has been recently elected an honorary member of the Brooklyn Woman's Club.

J. CHAPMAN, President of the Excise Board of Long Island City, was indicted last week, as were eighty others, for selling liquor without license.

T. HUGHES, unable to visit this country during the Centennial, has been obliged to decline the post of umpire for the University regatta of 1876.

JAMES GORDON BENNETT will write the article on Yachting for the new edition of Appleton's Encyclopedia, by order of its editors, Messrs. Dana and Ripley.

A SCOTCH paper states that Dr. Keneally lately sold his wig, gown, and bands to the proprietor of a wax-works exhibition at Glasgow. He got £20 for them.

COL. GEFFROY, a well-known Boniface of Cincinnati, has been appointed "Captain of the Beefeaters" by the King of the New Orleans Mardi Gras.

A COPY of the catalogue of the library collected by the late John Carter Brown of Providence, R. I., has been received by the Bibliotheque Royale of Brussels.

DR. ANDREW A. BONAR says that as a result of the work of Moody and Sankey in Glasgow, "they can lay their hands on 7,000 converts who hold out well."

COL. SANDFORD, Director of the British Section of the Centennial Exhibition, will sail from Liverpool for this country on the 16th inst., in company with Col. Forney.

MADAME NILSSON has made an engagement to give eight concerts in Scandinavia—four in Stockholm, two in Christiana, and two in Copenhagen—during the ensuing Spring.

CONGRESSMAN WALKER'S friends say he will never run for political office in Virginia again, but will make his future home in California, where his brother has struck a bonanza.

BIERSTADT is employed upon a forest interior, a representation of gigantic trees in the Mariposa Valley, and another very large picture representing the settlement of Californian Spaniards.

PROF. BLACKIE says the subscriptions to the proposed Celtic chair for Edinburgh University now amount to $35,000, and that its projectors hope to have the chair established within two years at the outside.

THE Rev. Dr. Bushnell of Hartford, Conn., is again seriously ill with the pulmonary complaint from which he has suffered for 20 years, and his friends have hardly any hope of his recovery. He is 78 years of age.

BOTANY.
Standard Text-Books,
BY
Prof. ASA GRAY of Harvard.

More extensively used in this country than all other Botanical Series combined.

HOW PLANTS GROW. A complete and charming elementary work. Price $1.12.

LESSONS IN BOTANY, and Vegetable Physiology, to which is added a copious Dictionary of Botanical terms. Fully illustrated. Price $1.50.

SCHOOL AND FIELD BOOK. A most popular and comprehensive school book. This work, in connection with "*How Plants Grow*," supplies a complete course in Botany for Common Schools, Academies and Seminaries. 682 pages. Price $2.50.

MANUAL OF BOTANY. For higher grades and Colleges. 760 pages. Price $2.25.
The same, with *The Lessons*. Price $3.

STRUCTURAL and SYSTEMATIC BOTANY, with 1,300 wood cuts. 556 pages. Price $3.50.

*** We will send single copies of either or all of the above, if desired for examination with a view to introduction, on receipt of *half* the appended prices. **The most liberal terms will be given for introduction.**

Full descriptive circulars of Gray's Botanies, with many testimonials from eminent scientists and teachers, by mail on application. Address

Ivison, Blakeman, Taylor & Co.,
Educational Publishers,
138 & 140 Grand Street, New York.

Wit and Humor.

SPARKS AND SPLINTERS.

THE popular key—San-key.

A "MAIDEN speech"—"Ask papa."

WHAT age is most deceiving?—Sausage.

THE best way to keep a secret is to forget it.

OFFERINGS of the season—Twenty cents on the dollar.

THE most successful kind of mettle these days appears to be brass.

NEW BEDFORD is said to have but one whaler left—a schoolmaster.

FOOLS don't know their strength; if they did, they would keep still.

CAN ladies with enameled faces be said to belong to polished society?

WHEN a dying man makes codicils to his will he is allowed to put on heirs.

"JOTTINGS by the weighside"—Figures made on a coal-cart by the scale-keeper.

WE know all about shooting stars, but often forget that the earth is a revolver.

"NIGHT threw her mantle o'er the world and pinned it with a star." Tasty wasn't she?

"YOU'LL build the fires or I'll be a widow," is the way the Fat Contributor's wife talks.

AN enterprising man in Philadelphia displays the following sign—"Fresh home-made pies and milk."

WHY is a married man like a candle?—Because he sometimes goes out at night when he ought not to.

A "RECEIPT" to get married, was what a young man applied for to the clerk of a court in a North Pacific town.

AN old maid in Reading married a tramp because, as she said, he smells just like an Italian count whom she met and loved.

IMPERTINENT PEOPLE—Barbers and dentists; the one takes you by the nose, while the other puts his fingers in your mouth.

NEARLY everybody knows that nearly everybody lies, and yet nearly everybody says: "What everybody says must be so."

"Is the Colonel here?" shouted a man sticking his head into a Kansas City street car. "He is," answered thirteen men, as they rose up.

"PATRICK," said an old gentleman to his servant, "we are all creatures of fate." "Well, if it wasn't for *fate*, how could we walk, sure?"

A KENTUCKY judge has decided that it is not legal for a farmer to hitch his wife up with a mule, no matter how anxious he is to plow.

"YES, I want my daughter to study rethoric," replied a Vermont mother, "for she can't fry pancakes now without smoking the house all up."

SPINNER, who is in Florida, writes his signature on the sands of a bayou, and the alligators come up to look at it and immediately get the jim-jams.

"How one thing brings up another," said a lady, absorbed in pleasing retrospection. "Yes," replied the practical Dibbs; "an emetic for instance."

> OH, let the poor woman's clothes alone;
> They're none of your concern;
> She never makes no fun of your'n,
> Then, why poke fun at her'n?

"Is it possible, miss, that you do not know the name of your best friends?" "Certainly; I do not even know what my own name may be in a year from this time."

THE young French ladies do not, in skating time, exchange a word with their partners. When they fall, however, they are permittted to mention the French for "ouch" in the presence of a gentleman.

NEURALGIA is the charming name of a charming girl in Florida. Her mother found it on a medicine bottle and was captivated with its sweetness. Some young man is certainly doomed to suffer neuralgia of the heart.

A MAN in New Hampshire had the misfortune recently to lose his wife. Over the grave he caused a stone to be placed, on which in the depth of his grief, he had ordered to be inscribed: "Tears cannot restore her—therefore I weep."

A LIQUOR dealer in Rochester placed a bust of Franklin above his counter. When asked why he did so, he replied that Franklin had drawn lightning from the clouds and he had a fellow-feeling for him, as he was constantly drawing lightning from barrels.

A CERTAIN parson, who was also a shool-teacher, handed a problem to his class in mathematics. The first boy took it, looked at it for a while, and said, "I pass." Second boy took it, and said, "I turn it down." The third boy stared at it awhile, and drawled out. "I can't make it." "Very good, boys," said the parson, "we will proceed to cut for a new deal;" and the switch danced like lightning over the shoulders of those depraved young mathematicians.

SHIFTED TILES.

ONLY fancy, if Hats had been worn at different periods, the effects would have been peculiar, wouldn't they?

Champion Milk Pan

AND COOLER.

Over Fifteen Hundred in Actual Use.

All about Gardening

For HOME use and for MARKET in ROOT'S GARDEN MANUAL—practical, pointed and thorough—containing one-half as much matter as $1.50 books on the subject. Gardeners throughout the country commend its practical labor-saving methods as invaluable to them. Sent for 10 cents, which will be allowed on the first order for seeds.

J. B. ROOT, Seed Grower,
Rockford, Ill.

WILLARD'S PRACTICAL Butter Book

ONLY COSTS $1,

And should be in the hands of every Farmer's wife in this country. It is full of practical and scientific information upon every branch of butter making, from the care of cows to butter in the market, and should be kept for constant reference in every house where that article is made.

☞ *This book is fully and handsomely Illustrated.*

Every one can understand it, and improve the quality and quantity of their butter by reference to its pages. Written by one who has not only made a life study of the subject, but who is himself a

Practical Dairyman,

It cannot but be thorough and useful. No book contains more solid information upon the subject in so few words. A complete index enables the reader to refer to any branch of butter making, and take in the whole subject in a very short time.

Lay it beside your churn, and apply its useful lessons each day, and your one dollar book will have yielded you fifty dollars before the end of the year.

Sent, post-paid, upon receipt of $1.

Consumers Importing Tea Co.,

No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

WILLARD'S Practical Dairy Husbandry.

A Complete Treatise on Dairy Farms and Farming,
Dairy Stock and Stock Feeding,
Milk, its Management and Manufacture into Butter and Cheese,
History and Mode of Organization of Butter and Cheese Factories,
Dairy Utensils, Etc., Etc.

BY X. A. WILLARD, A. M.,

Dairy Husbandry Editor of Moore's Rural New-Yorker, Lecturer in Cornell University, Maine Agricultural College, Etc., Etc.

THIS is the most full, practical and reliable work on Dairy Husbandry extant; indeed the only one which describes the recent great improvements in the Dairy Business. It is highly commended by leading Agricultural and other influential journals, and must speedily become (in fact is already) the *Standard and Only Authority.* It will pay every one engaged in any branch of dairy business, or who keeps a single cow, to obtain and study this work.

Floricultural.

A NEW HARDY SHRUB—XANTHOCERAS SORBIFOLIA.

THE London Garden, a weekly magazine of horticulture of the highest merit, gives with every issue of the new year a beautiful colored plate of some new or rare flower or fruit likely to prove of permanent value to our gardens. It deems *Xanthoceras sorbifolia*, reproduced in our engraving, as the most important introduction made during the last few years in the way of hardy shrubs.

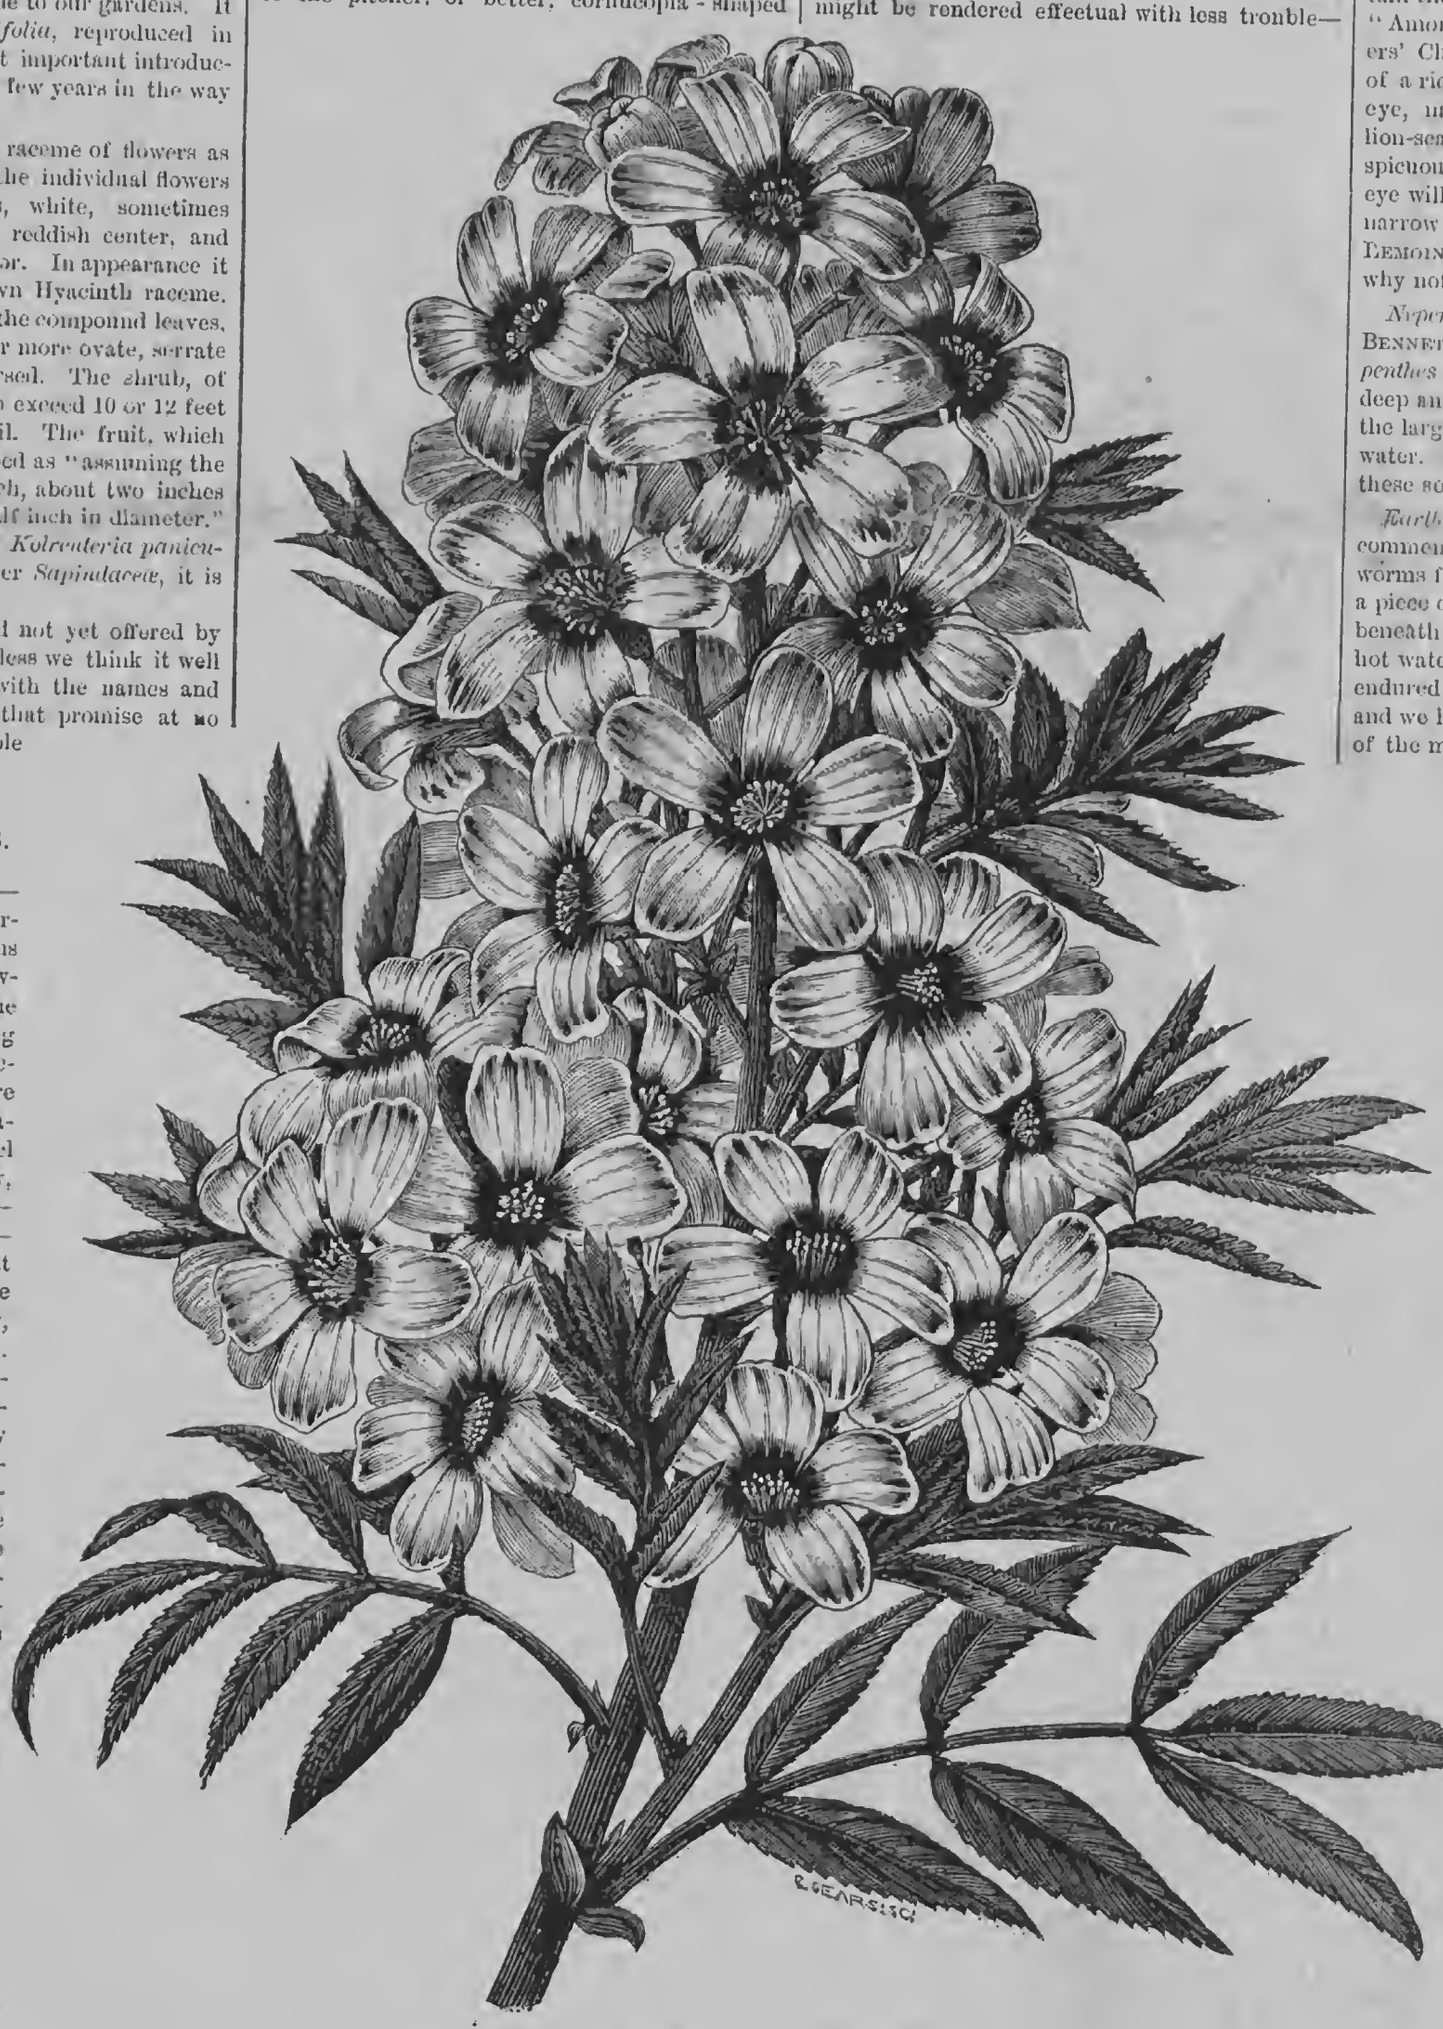
The plate represents the raceme of flowers as about eight inches long—the individual flowers consisting of five petals, white, sometimes slightly rose-tinted, with a reddish center, and an inch or more in diameter. In appearance it reminds one of a well-grown Hyacinth raceme, except that here and there the compound leaves, consisting of half a dozen or more ovate, serrate leaflets, are freely interspersed. The shrub, of a bushy habit, is said not to exceed 10 or 12 feet in hight, blooming in April. The fruit, which very rarely forms, is described as "assuming the shape of an elongated peach, about two inches in length and one and a half inch in diameter." The seeds resemble those of *Koelreuteria paniculata*, near which, in the order *Sapindaceæ*, it is placed.

This plant is still rare and not yet offered by our nurserymen. Nevertheless we think it well to familiarize our readers with the names and characteristics of novelties that promise at no distant day to become valuable to us.

FLORICULTURAL NOTES.

Variegated Pelargoniums.—Several accounts have appeared, of late, of Pelargoniums giving different colored flowers from different parts of the stem. In our own seedling cultivation this has never occurred—but it seems no more remarkable than that the calyces and pedicels of an umbel should be divided vertically, half being silver variegated—the other half plain green;—no more remarkable than that a single plant should produce three distinct shoots, namely, bronze, tricolor and green. The first of these we have observed repeatedly, and the latter twice. We have already referred to our seedling Pelargonium that, if cut perpendicularly through the middle of the main stem, would have left one-half wholly silver variegated, the other plain zonale. The first umbel of this plant growing from the apex of the main stem was marked as we have stated, half silver—half green. But the corollas revealed no difference of color. PETER GRIEVE mentions an instance in which a seedling developed three distinct varieties, viz., "Emperor" and "Empress of the French," and "Rainbow"—and such variations are by no means uncommon in variegated seedling Pelargonium cultivation.

Seedling Smilax.—In a late visit to Mr. GAMEWELL's nursery at Hackensack, N. J., we were shown seedling *Myrsiphyllum asparagoides* which, if not an improvement upon its parent, is at least quite different. The leaves are nearly twice as long, more lanceolate, more acuminate. We need hardly hope for any notable improvement upon this already perfect little vine. In his goodly collection of *Sarracenias* we saw numbers of sow-bugs (*porcellio*) that had either been drowned or poisoned by the "insidious nectar" of the pitcher, or better, cornucopia-shaped leaves. Several were partly—two half, filled with those animals, emitting a putrid odor from their putrescent mass. Scooped-out potatoes cut in halves are used in many greenhouses as traps for the sow-bug. Preferring the potatoes to the roots of plants, they are thus collected and killed every day. We know of an Orchid-house filled chiefly with Dendrobium nobile—an especial favorite of the sow-bug, in which a half potato is always kept upon each pot. Though this plan is successful, perhaps the *Sarracenia* might be rendered effectual with less trouble—though it must have plenty shade and moisture.



NEW SHRUB—XANTHOCERAS SORBIFOLIA.

Pelargoniums of the Future.—Mr. V. LAMOINE says in the Revue Horticole:—"For 1876 surprises await us, and there exist, ready to be distributed, plants with colossal umbels in tints of lilac, rose, rose-purple, rose-violet, lake (yes! true lake), purple, etc. The *debut* has been deferred;—now we advance, *a pas de geant*, and perfection will quickly be attained. Pale violet and yellow tints are still wanting. Shall we obtain these? Who can tell? After all, why not?" "Among the newer Pelargoniums," the Gardeners' Chronicle says, "is a most distinct variety of a rich salmon-yellow color and striking white eye, named *Jealousy*;—and *Dazzler*, a vermillion-scarlet, remarkable for its large and conspicuous white eye." We wonder if the white eye will ever be extended so as to leave only a narrow and distinct rim of crimson? In M. LEMOINE's words—"Who can tell? After all, why not?"

Nepenthes.—In the establishment of Mr. WM. BENNETT (Long Island) we saw pitchers of *Nepenthes* brightly mottled with purple, five inches deep and three diameter. It seemed to us that the largest one would hold an ordinary goblet of water. Very strange forms of vegetable life are these so-called Carnivorous Plants.

Earth-worms.—An invention is advertised and commented upon in England for preventing worms from entering pots. It consists simply of a piece of perforated metal placed over the holes beneath the drainage material used. We use hot water to kill earth-worms—as hot as can be endured by the hand. This kills them instantly, and we have never known it to injure the roots of the most delicate plants. The experiment is easily tried.

The Eucalyptus as an Insectifuge.—We extract the following passages, says the Illustration Horticole, from a letter received from Mr. C. BALTET of Troyes, and recommend our readers to try the experiment for themselves when the season arrives: "Lately my brother-in-law, being very much disturbed in his sleep by mosquitoes, took it into his head to place a young plant of Eucalyptus in his bedroom over night. From that moment the insects disappeared, and he slept in comfort. I have been following his example, with the same result. Should this really prove generally efficacious, our Southern provinces will be freed of one scourge. People will use young plants of Eucalyptus instead of mosquito curtains."

We commend the above to our New Jersey readers. A handful of seeds of the Eucalyptus globulus may be purchased for twenty-five cents. Planted in pots, they will germinate in two weeks, and fine young plants will have grown for next summer's use.

Mrs. P. Caldwell, Farmersville, N. J.—Cinerarias may be sown in March in light soil. Prick out when true leaves appear into small pots, and shift to larger as required.

Auriculas.—Sow in leaf-mold, loam and sand. Cover very lightly. Keep shady and moist.

C.

Industrial Topics.

HAVE FAITH IN YOUR BUSINESS.

THE Live Stock Journal thus discourses on a subject which is applicable to men in all avocations, and especially to farmers who are most apt to become discouraged over temporary failures of crops and low prices for produce:

John Johnson of Geneva, N. Y., came to this country with little more means than to plant him on his American farm. He saw the needs of his soil, and commenced draining off its surplus water, and the jeers of his neighbors at his folly, were soon turned to astonishment at the crops he produced. They saw him reap a wheat crop double the average of the State, raise cattle, and feed sheep at a profit, while others reported only loss. He proceeded, with the calm confidence of knowledge, to tile drain his 300 acres, at an expense much greater than he paid for his farm; but for some years, in relief of his old age, he has been able to rent portions or it at $25 per acre. He had faith in his business.

There is no occupation of man that requires, for its successful prosecution, more careful study, more confidence, based upon knowledge, than agriculture. We see the want of faith in the conduct of a large class of farmers, who never seem to have hit upon the right line of business. Now they are dairying, having gone into it when dairy stock was high, costing a large sum to start, but the product having been depressed for a few months, all confidence is gone in the future of the dairy industry, and their cows are sold at a heavy loss. Next they take to sheep, but wool soon has its turn of depression, and confidence is lost in this industry, and its abandonment follows. Hops now becomes their hobby. Fifty cents per pound is quite too alluring; but when their crop comes, a season of plenty has returned and down goes the price to ten cents. Woe meets them here—they turn in disgust from their thrifty vines, and seek their neighbors to whom they sold their cows. And now begins the dairying again—this business of battledoor and shuttlecock, "everything by turns and nothing long." These are the farmers who talk loudest that farming does not pay. They do not give it time to pay in any one direction. They are to be pitied. They have no faith in anything—they float with the current.

How strange that they should not see that every great agricultural industry is founded on the wants of society, and that these needs continue ever the same, the price of the product being governed entirely by demand and supply. Each branch must have its fluctuation in price, and the only true way to determine the profit is to take the average of ten years. This average will show fair prices for dairy products, for wool, for beef or mutton, for grain, for hops, for fruit, and for every product of the farm. The mole-eyed man who can only see one year's returns, and tries to govern his actions by that, will always find himself in the ebb of the tide.

AMERICAN MEAT IN ENGLAND.

THE London (Eng.) Farmer of Jan. 10, speaks in most favorable terms of the American beef sold in that market. Several processes of preserving it has been tried, but the only one which has succeeded is described as follows:

The cattle are mostly obtained from the Western States of the American Union and are slaughtered at New York. Immediately after killing, the beef is chilled by being placed in a prepared cold room, and is sent on board the vessel the next day. In the vessel, between decks, a huge room or box is fitted; in this room a fan is worked by the same steam power that propels the vessel. The ice needed for cooling purposes is placed in what we may call an outer compartment, and matters are so arranged that a constant supply of cold, dry air, at a temperature of from 30 to 40 degrees, circulates through the room, being again and again drawn off, and passed in again fresh over the ice in the outer compartment. The meat is carefully stitched in canvas, and is hung on hooks from the ceiling of the room. In ten days after being slaughtered, the meat may be expected at Liverpool, and on the next day it reaches London, being conveyed from Liverpool to London in the ordinary meat trucks. When it reaches the market it is almost, if not quite, impossible to distinguish this American meat from that which has come down from Scotland. As the room or box in which the meat is kept on the voyage here is not a fixture, the space occupied by it is available for any sort of cargo during the return voyage.

The meat which has been preserved by this process has stood every test, and not only the salesmen, but consumers—for it has been specially tried, both in the City and in the West End—speak favorably of it. Not only is it fresh, but it has that quality which good housewives know as "old-killed," which is so often wanted in our home-killed meat. It is evident that the Americans who are engaged in this new meat trade are working with as much caution as skill and energy. The meat is consigned to Mr. J. D. Link of the Central Meat market, and there is constant correspondence between him and the gentlemen at New York. They want to know what kind of meat will best suit our market, and at present it is intended to send carcases weighing from 750 to 850 lbs. Probably by the time this is in the hands of our readers the fifth cargo will be on sale in Smithfield.

AMERICAN CORN ABROAD.

THE Massachusetts Ploughman says:—If our corn had been a favorite food in Europe, or even in Great Britain, as our wheat is, it would long before this have been exported in increasing quantities annually. But of late the consumption of corn has rapidly increased in the United Kingdom, being not so much used for human food as for that of cattle and stock. The latter have been fatted hitherto on oats, barley, peas, turnips, and oil-cake; these cannot be produced so cheaply now as they have been in the past, and it wants nothing but slightly lower prices for corn to open to our immense crops of this royal cereal a market that will continue to be a marvel for generations. Stall feeding must become more and more the habit in a comparatively small country like England, and cattle must be sustained with what will pay to feed to them. Stall feeding also increases the productiveness of the land and thus increases the production of wheat.

It is therefore estimated that by lowering the price of American corn ten cents a bushel on laying it down at Liverpool, the fifty millions of bushels now annually consumed in Great Britain, of which one-half is supplied direct from the United States, will be rapidly increased until the export of this staple becomes one of the standard elements in our foreign trade. We have seen the computation that if American wheat could be delivered in Liverpool, at the average price of $1.40, which is the average price of Russian wheat in that market from 1860 to 1872, and if American corn could be delivered in the same market at the average price of 80 cents a bushel, the export trade in both these staples from this country would speedily mount up to 75,000,000 bushels annually of wheat, and 200,000,000 bushels annually of Indian corn. This would bring up our cereal exports to a level with that of cotton where they should be. What we need first is a sound currency and duties that encourage an export trade.

Field Crops.

ANOTHER NEW VARIETY OF CORN.

THE Platte City Landmark says:—"Mr. THOS. L. TURNER has this week shown us a peculiar kind of corn, called 'cow corn,' which was grown in Harrison County in this State. The ear is about four inches long and has no cob. Each grain or kernel is covered by a separate husk; while the whole ear is inclosed in the usual outer husk or shuck. The grains are exactly like any other well developed corn. It is said to be excellent for stock and many persons have obtained seed to experiment with it."

Wonders of this kind appear to have many lives or, RIP VAN WINKLE like, take long naps occasionally. We have been acquainted with the above supposed to be new variety ever since we were old enough to know anything about corn or its habit of growth. It has however been brought out under various names, such as the Rocky Mountain Wild Corn, South American, Oregon, California, Mexican and Indian Corn, and by some supposed to be the genuine "original" corn of this continent.

The cob is very small it is true, but still there is a central stem which answers the purpose of a cob, while, as stated above, each kernel is inclosed in separate husk-like envelopes, varying in length from an inch or more on the lowermost kernels on the ear, gradually becoming shorter until the upper ones scarcely cover the grain. The ears however in the specimens referred to in the above paragraph are rather short, for we have one that has been in our cabinet many years which is fully twice "four inches" and twelve-rowed. This old variety of corn is frequently cultivated as a curiosity, but is not considered worth growing for any other purpose.

Mr. TURNER'S new cow corn is just about as much of a novelty as "Hulless oats" or Tartarian Buckwheat, and no more. If the Editor of the Platte City Landmark had referred to his copy (supposing he had one) of KLIPPART'S work on "The Wheat Plant," he might have found this "new cow corn" described on page 672, with a figure of a section of an ear on the preceding page. Books are very handy sometimes for reference, if nothing more—especially when one desires to know whether a supposed to be new thing is or is not just what is claimed for it.

HOP GROWING—THE OTHER SIDE.

EDS. RURAL NEW-YORKER:—Your correspondent T. E. B. may mislead some in his highly-colored picture of the profits of hop growing. We must remember that all expenses of cultivating, harvesting and curing are much greater than formerly, while, from the prevalence of lice, mold and blight, the average crop is largely reduced. Five hundred lbs. per acre is now thought a fair crop, taking one year with another. Hop poles are an expensive item—so also are the drying house, stoves, kiln, pipe, cloth, hop boxes, hop sacks and the fetching and carrying of pickers often many miles distant.

The idea of one man and horse attending to six or seven acres quite easily is absurd. It could not be done properly if he could work day and night continually. Two men must work very hard to attend five acres. In fact there is an endless amount of work to be done in a hop yard; no one can tell how much until he has to do it himself.

J. E. B. says hops can be profitably grown for 8c. per lb. Here, in Otsego Co., N. Y., it costs 10c. per lb. to harvest a crop of hops. We pay 40@50c. per box for picking and $1.50 per day for box tending, and we must board the pickers in the best style or they will go somewhere else.

The cost of producing hops is not less than 15c. per lb. Again, he says a hop yard will last without replenishing from thirty to fifty years. What a pity we could not plant for the farmers here, so that we should not be troubled to plant so often. A yard may last four or six years; or the vines may be in good condition in the fall, and all be dead in the spring. From a hill near my farm you may stand in one place and count fifty hop yards. The oldest hop yard in this vicinity is twenty years old, and that has been planted over as fast as a hill died, until it is three times new.

Hop growing is a very uncertain business; sometimes very good and sometimes very poor. New beginners had better go slow until they know what they are about. H. W.

Cooperstown, N. Y.

BRITISH VARIETIES OF WHEAT.

THE Irish Farmer's Gazette gives the following particulars about the varieties of wheat now grown in England and Scotland:

The fine varieties of wheat, such as Chiddam, Talavera, or Pearl, are delicate growers, and yield least produce, although from their quality the grain of these wheats brings a high price. It is the farmer's interest to realize most money per acre, and he will better attain this by growing red wheats. Of these there are Kessingland, Hallet's, Browick's, and the Prolific Spalding, all belonging to the same class, and very large croppers; but the true Lammas red and Nursery red are by many considered preferable, the latter being a particularly saleable wheat, and by all judges considered equal to the finest white wheat for the baker.

In the best wheat-growing districts of the south of England, a mixture of Lammas and Nursery is much grown. The straws being of different lengths, the ears have more room, and give the mixture the character of Fenton wheat, which is perhaps the most prolific and profitable white variety in cultivation. We may here observe in regard to sowing mixtures of wheat, that produce of the first mixture may assume quite a different character if sown again. The two varieties may hybridize and produce a new variety in a partial state of development. If mixtures are sown, it is safer to mix varieties which have been grown separate.

Wheat growers in East Lothian usually get a change of seed wheat from England every year. The extra cost is more than balanced by thinner sowing, to say nothing of the superiority of the crop, which is invariably better after English seed, and it has this further advantage, that the crop from English seed ripens at least a week earlier, which is of importance in the case of wheat sown late in the winter months.

Before concluding these remarks, we shall notice the special characteristics of two or three of the principal varieties mentioned above. The Nursery red, as we have stated, is much grown in the south of England, and its fine baking qualities make it a favorite in France. The grain is small; the straw very tall in soil adapted for it, and likewise stiff. This wheat, from the small size of the grain, should be sown thin. Lammas red has long been a favorite variety in East Lothian. It is a tall, stiff-strawed variety, producing a large weight of straw per acre. The grain produces fine flour, much esteemed by bakers. The Fenton is a white variety of wheat, and has long held a pre-eminent position in the opinion of East Lothian wheat-growers. The peculiarity of the Fenton wheat is the great dissimilarity in the length of the straw. A sheaf of this grain is eared down to the band. The straw is very stiff, and will stand much adverse weather.

The Poultry Yard.

THE HAMBURGS AS LAYERS.

J. G. MCKEON of South Acworth, N. H., writes the Boston Cultivator that in his experience no variety of fowls equals the Hamburgs as layers. They are hardy, small eaters and wonderfully prolific; but, on account of their small size, are not recommended for their flesh. Nothing shows the breeder's skill better than a well marked Golden or Silver Spangled Hamburg in good condition. It requires much skill to breed them correct in marking, more than almost any other breed. The great objection to Leghorns is, that their combs and wattles freeze badly, unless they have very warm quarters. Of course the Asiatics will endure cold weather the best—but Hamburgs are reasonably hardy in this respect. All remember the old Bolton Grays; they were about the same as the Silver Pencilled Hamburgs, only not bred to such perfection of marking. Most farmers will tell you they never had such layers as the old Bolton Grays. It is not unusual for hens of this breed to lay 200 eggs each in a year. The eggs are rather small, pure white, and usually very fertile. The hens are good layers till they are 3 years old, while most breeds are the best the first year. Of course the Hamburgs are not the best for all purposes, but for eggs they stand at the head. They are good foragers, and somewhat inclined to ramble, but on a farm where they have room, this is no objection. Many farmers have a horror of the old "settin' hen," and do not want to raise many chickens; this breed is just the thing for such men. I think fancy runs too much now to the large breeds.

LARGE POULTRY YARD.

THE following account of the largest poultry yard in the State is given in the Fanciers' Journal:

It is at Greene, Chenango County, N. Y., and is kept by Mr. A. B. Robeson. He has 6,000 ducks, 4,000 turkeys and 1,200 hens. They consume daily sixty bushels of corn, two barrels of meal, two barrels of potatoes, and a quantity of charcoal. The meal, potatoes and charcoal are boiled together and form a pudding, which is fed warm. He has commenced to kill them off, and employs fifteen hands to pick, two to kill, and one to carry away and pack on racks until frozen, then they are ready to pack for shipping. He also employs two men to cook the feed and feed them. He has twelve buildings for his fowls, from one to two hundred feet long, fourteen feet wide, and seven feet under the eaves, with a door in each end of them.

Mr. Robeson bought most of his ducks in the West, and had them shipped in crates—three dozen in a crate. He also has an egg house, 35 by 50 feet, and four stories high. The outside is eighteen inches thick, and built of cut stone, laid in mortar, boarded up on the inside and filled in between the outside and inside wall with sawdust, it taking 3,000 bushels. Mr. Robeson claims that he can keep eggs any length of time in this building. He also keeps the poultry that he is now dressing until next May or June, which he sells for eighteen or twenty-five cents per pound, and it cannot be told from fresh-dressed poultry. He gets ten cents per pound for turkey feathers, twelve for hen's, and sixty-five for duck's. He says there is money in poultry, and he thinks he can make out of his 6,000 ducks enough to pay for his egg house, which cost $7,000. He intends to keep a great many more next season, and has agents out all over the country buying up poultry and eggs.

TONIC FOR FOWLS.

IT is a good plan to keep on hand the preparation of sulphate of iron, so often recommended by experienced poultrymen. It is frequently useful in the poultry yard, and is thought, in a measure, to ward off some of the ailments to which fowls are subject. It is a useful tonic during the moulting season, and a great benefit to fowls in cold winter weather. During the summer it serves as a disinfectant, keeping the drinking vessels from becoming soured or foul. Its constant use in the water, however, is not to be commended, since, by such a course, its efficiency in cases of real need would be less marked. Several formulas have been given for preparing the solution, so as to have it in convenient form at all times. Some of these make the solution too weak. The following will be found to be right, and the proportion being all in "ones" the formula is easily remembered. In one gallon of warm water dissolve one pound of sulphate of iron, (copperas) and then add one ounce of sulphuric acid. Put the mixture into a jug, from which it may be used as needed. To one quart of drinking water add one teaspoonful of the solution. It gives to the water a rusty appearance and a pungent taste.—*Southern Farmer.*

Dairy Husbandry.

THE PHILOSOPHY OF CURING CHEESE.

Address of X. A. Willard of the Rural New-Yorker before the Vermont Dairymen's Convention, Jan. 21, 1876.

AMERICAN Cheese will not be likely to reach its highest excellence until more attention is given to the construction of curing-houses. While our cheese makers have been desirous of learning the best methods of handling milk to obtain a fancy product, and while in many instances they have been able to make an article equal to the *best*, up to the time it leaves the press and is carried to the curing-room, they have found their skill at the vat not unfrequently neutralized in the curing-room, the cheese often deteriorating from week to week, and turning out a second or third-class product.

There is an erroneous notion among many dairymen and cheesemongers as to the proper proportion of constituents required for making a first-class cheese. The impression prevails that the best cheese must necessarily contain the most butter in its composition, and this has deterred many from making improvements in the true direction.

It is almost impossible to convince cheese dealers and dairymen that a rich, mellow, palatable cheese, having the taste and appearance of much fat in its composition, can be made from milk not particularly rich in butter, and yet such has been proved over and over again, not only by cheese makers who have had the milk and its manufacture under their immediate charge, but by chemists who have subjected such cheese to ultimate analysis.

It has come to such a pass at our Conventions that any statement of facts concerning this question is regarded by many as a direct injury to our cheese industry, because, as they say, it leads to a more extensive practice of skimming, which, by increasing a lower grade of cheese, must eventually ruin the reputation of American cheese in foreign markets. Thus, by suppressing truth and by instilling a false notion concerning the real value of butter in the cheese, dairymen have been led away from one of the most important requisites to success—the improvement of our cheese while undergoing the curing process.

In discussing this subject, I hope it will not be charged that I am advocating skim cheese manufacture. That is not my purpose, but rather to eliminate truth. If any one is so warped by prejudice that he must shut his eyes to the truth; if he is so set in his own opinion that he will not try to get out of the rut, but still persists in wallowing in the mire of old prejudices, no reasoning of mine can help him onward in the road to progress. I know there are many such men, and they are a drag on the dairy industry of the country. They believe that a cheese is only good in proportion to the amount of fat in its composition; that all poor cheese is the direct result of skimming. They are continually harping upon the danger of losing the reputation of American cheese abroad, and yet they offer no suggestion and make no effort for improving its quality.

THE COMPLAINT AGAINST AMERICAN CHEESE.

What has been and is to-day the chief complaint against American cheese? Not that it is deficient in fat, but that it is of bad flavor, defective in texture, and has a tendency to early decay. Any character of cheese that is short-lived, that is liable to lose flavor and fall into early decay on the dealer's hands, will be regarded as more or less dangerous to handle, and buyers must be expected to regulate their prices in proportion to the risk of holding.

One would suppose from what is frequently taught at these Conventions that nearly the whole product of cheese shipped abroad is made at creameries and from milk which had been deprived of nearly all its butter. It is convenient, of course, for whole-milk cheese manufacturers to attribute low prices and their troubles in the market to the creameries; but it is a false assumption and most mischievous to the well-being of our dairy industry. The trouble of stagnation and low prices comes from the great abundance of whole-milk cheese—cheese not deficient in butter, but defective in flavor—defective in moisture—either too much or too little—cheese badly made, and for the most part *badly cured*.

There never was a time when the market was glutted with "extra fancy cheese"—cheese of clean, sweet, nutty flavor—cheese of good, keeping qualities. I say there never was a time when such cheese would not sell at good, fair prices.

COMPARATIVE PRICES OF ENGLISH AND AMERICAN CHEESE.

Look over the English market reports for the past ten years and you will find that English cheddar has ranged not far from 90s. sterling per hundred weight, year after year, while American varies from 30 to 70 shillings. The following were the quotations of the London market on Dec. 11, 1875:

English cheddar, first quality, 92s. per cwt., equal to 22½c. per lb. currency; second quality, 74s. per cwt., equal to 18c. currency. English Cheshire, first quality, 86s. per cwt., equal to 21c. currency; second quality, 76s. per cwt., equal to 18½c. currency; third quality, 70s. per cwt., equal to 17c. currency; fourth quality, 50s. per cwt., equal to 12¼c. currency. Scotch cheddar, first quality, 76s. per cwt., equal to 18½c. currency; second quality, 54s. per cwt., equal to 15½c. currency, Dutch Gonda, first quality, 60s. per cwt., equal to 14¾c. currency,; second quality, 56s. per cwt., equal to 13¾c. currency. Dutch Edam, first quality, 68s. per cwt., equal to 16¼c. currency; second quality, 56s. per cwt., equal to 13¾c. currency. American, first quality, 58s. per cwt., equal to 14c. currency; second quality, 50s. per cwt., equal to 12c. currency; third quality, 40s. per cwt., equal to 9¾c. currency. Such a difference in values proves either that our goods do not enter into competition, or that the quality is so inferior that our competition is practically of no detriment to the foreign producers.

Mr. LIVES of Derbyshire, Eng., who has made a specialty in keeping the run of these matters, says in a recent letter to me that there has been scarcely any variation in the price of first-class cheese for many years in the markets of England. The variation has been confined exclusively to the common and inferior grades.

The charge, therefore, that creamery skim cheese is ruining the market for *good cheese* at home and abroad is, in my opinion, not well-founded, and demands correction. The low prices are on the skims and lower grades, not on the best. To make a comparison let us take the article of butter. In regard to quantity the cheese product dwindles into insignificant proportions beside that of butter, for it is estimated that we are annually making from a thousand to fourteen hundred million pounds of butter, and only three hundred million pounds of cheese, or nearly five times more butter than cheese, and we all know the quantity of poor butter as compared with that of cheese is immensely greater; and yet there is a premium on a fine article of butter, the price not unfrequently running from 75c. to $1 per pound. It is so on flour, on meats, and on all classes of goods; the depreciation is not on the extra-fine article, which is always in demand at good prices, but on the common or inferior grades. So I think the whole-milk factories, which are making a superior product, need have no fears that their business is to be injured by the skim-cheese men, but rather that there will be a better demand for their goods and better prices, while the common grades must be the ones that suffer in price. The important point I wish to urge in this connection is the adoption of means to improve American cheese of all sorts, whether it be made from whole-milk, milk skimmed or half skimmed. The way to retain our reputation at home and abroad is not by resting on what we have already accomplished and by urging creameries to abandon their business or throw their skimmed milk away, but, on the other hand, to stimulate manufacturers to continue to make a better and better product from the material in their hands. If the cheddar dairymen of Somersetshire, by skimming the night's milk and adding to it the morning's milk can make a cheese that will sell at from 20 to 30 shillings sterling more per cwt. than that from our best whole-milk factories, then there is room for us to improve our goods, so as to compete with cheddar dairymen. If Holland can make a skimmed cheese that competes in price with our best whole-milk cheese in the English market, is it not time to inquire into the defects of our system of cheese making, instead of making loud cries against the butter factories, with useless efforts to suppress them? I say useless efforts, because butter and skim cheese will continue to be made so long as they yield satisfactory profits. If more money is to be got by turning skimmed milk into cheese than into meat, it will be hard to convince those who are making a handsome profit in this way that it is better to abandon that business in order that the reputation and profits of their neighbor who makes whole-milk cheese may be increased. The true way, it seems to me, is to accept the situation, and then all hands go to work to improve our product, thereby increasing our reputation and profits. This can be done by studying the requirements of the curing process, by placing the cheese under certain conditions that favor its perfection, instead of allowing chance to have control in this matter.

THE THREE POINTS IN CURING.

The cheddar dairymen, by long-continued practice and experiment, have established three points in the curing of cheese. First, that a temperature of from 70 to 75 deg. is the proper range for securing mellowness in texture, sweet, clean, nutty flavor and long-keeping qualities; second, that this temperature must be maintained throughout the curing process, and that uneven temperatures much above and then sinking below the range named is prejudicial to fine flavor; and third, that excessive dryness of the atmosphere, like that produced from the heat of stoves, injures texture and flavor by producing a too rapid absorption of moisture. Take, for instance, the lump of curd as it comes from the press. If it has been well made from average whole milk, we have a tough, curdy-like mass, consisting of—without assuming to be exact—of, say, 28 per cent. of butter, 40 per cent. of water, and some mineral matters. It is in this condition about as unfit for food as unbaked dough. Now, what is required of this piece of raw curd to fit it for the palate of the fastidious cheese eater of England? Well, in the first place, the caseine must be completely broken down and intimately mingled with the butter, while a portion of the water must be eliminated and the balance so distributed through the mass as to make the whole a homogenous substance—mellow, plastic, delicious. The moisture must be so intimately mingled through the whole that it cannot be easily separated or distinguished from the other parts, but rather giving one the impression, when a bit of the cheese is pressed under the finger or tasted in the mouth, that it is rich in butter. In addition, the several parts, while undergoing this change, must have retained a clean, sweet, nutty flavor. Now, we know by analysis how much moisture should be held in a properly-cured cheese. The analysis of the very best of the cheddar cheeses when six months old show that it contains nearly 34 per cent. of water, a little more than 33 per cent. of butter and 28 per cent. of caseine. An analysis of the best American cheese indicates about 27 per cent. of water, 35½ per cent. of butter and 26 per cent. of caseine. In other words, it has 2½ per cent. more butter and 3 per cent. less water than the English cheddar, thus indicating that the 3 per cent. of moisture in the English cheddar in excess of that in the American is made to take the place of butter, producing a more palatable and desirable cheese, and one that will sell for more money in the English market than the American.

Mr. REED of Herkimer, who for some years kept an accurate record of the weight of cheese from the time it was made up to different dates, found the average shrinkage of cheese during the first thirty days after manufacture to be—in June, 10 per cent.; July, 12 per cent.; August, 6 per cent.; September, 3 per cent.; October, 3 per cent.; November, 4 per cent.; December, 3 per cent. Thus showing that as temperature decreases in the fall the shrinkage also decreases. It is well known that our best cheese is of September make. The temperature of the weather during September and October approximates more nearly to 70 deg. than in June or July.

I think it may be safely assumed that in all well-cured cheese of desirable quality and flavor we must have at least from 30 to 33 per cent. of moisture, or else an excess of fat to more than supply the deficiency of moisture when the latter runs below 33 per cent. The defect complained of in American factory cheese when well made is a tendency to dryness. In some of our home markets, like Boston and Philadelphia, for instance, a grade of cheese made in Ohio has obtained some popularity. It is softer and more plastic than the ordinary shipping cheese of New York. Much of it has the appearance of possessing an excess of fat; it is not fat but moisture, which is so intimately blended with the solids as to be taken for what the cheesemonger denominates "good stock."

One of the prominent faults in curing cheese is a too rapid evaporation of moisture in the *early stages* of curing. The water does not have a chance to assimilate with the other parts before passing off; hence dryness and apparent lack of butter. If the evaporation had been gradual and time given for the water to become assimilated or "fixed," so to speak, in the cheese, the curing process would be carried on more perfectly, and the evaporation thereafter would of necessity be more slow. I saw this exemplified in the experiment made at the McLean factory last summer, when it was attempted to cure cheese by a process of applying dry steam in the way lumber is seasoned. The cheese came out insipid and almost tasteless so far as a development of a cheesy flavor was concerned, and although it was placed in the curing-room and kept there a long time, it did not again take on a good flavor or become mellow like cheese properly cured. Again, when the fermentation is carried on unevenly—at one time hastened by high temperature and then checked by a low temperature—the cheese is apt to put on a bitter taint. I used to think this bitter taint came, for the most part, from weeds which the cows ate (and it does take taints in that way); but I have found from experiment that a bitter taint can be developed in any cheese by alternately stimulating and checking fermentation, and this repeatedly under high and low temperatures.

There are immense quantities of cheese, well made at first, that are seriously injured by this bitter taint. It is of various degrees of intensity, according to conditions in curing, but all leaving an unpleasant taste in the mouth. It is particularly objectionable to English buyers, who are generally experts in discriminating defective flavors in cheese.—[Conclusion next week.

The Herdsman.

HOLSTEIN CATTLE.

ISAAC AUGUR, agent of the West Pittsfield, Mass., Shakers, writes to the New England Farmer thus:

Having heard, from time to time, comments through the public journals and verbally, some in favor and some opposed, I offer a few remarks which have grown out of actual experience concerning the merit of this noted stock during the past eighteen months. Having owned two bulls and two cows, thoroughbred, and having seen their product in milk and butter, I feel able to say something in their favor.

One cow, seven years old in the spring of 1875 calving March 17, has given, on an average, twenty quarts per day to the present date. I tested her milk in butter from the 13th of June for seven days, during which time she made fourteen pounds of nice butter, with no extra feed and no more than a common pasture.

The second cow, six years old in the spring of 1875, calved Sept. 22, 1875, and after four or five days, her milk was reserved by itself and set for cream, after letting the calf suck what it would three times a day. From the surplus of seven days, I found, on weighing the butter, thirteen pounds of a fine article, and, in total quantity per day, after three weeks of the time of the calf sucking, she had averaged from twenty-four to twenty-six quarts per day of milk.

November 24th, 1874, I bought a thoroughbred imported Holstein bull, one year old past, and his gain in ten months is four hundred pounds, making an average of forty pounds per month, and not on high feed.

They are a fine growing stock, large, good feeders, and I can say, with all freedom, that they are, in my estimation, the best for market, milkers, butter, cheese, oxen and beef of any thoroughbred stock now known in our country. I should be pleased to show these above samples to any and all who may be pleased to call.

STEAMING FOOD FOR CATTLE.

THE editor of the New England Farmer, sums up his conclusions in regard to steaming food as follows:

If one has considerable quantities of coarse or inferior fodder to work up, and wishes to make up for its inferiority by the use of grain, and if the principal object is selling milk by measure, without special regard to quality, and if the number of cows kept is large, say twenty or more, and one expects these conditions to exist several years, it will pay to purchase a good steam boiler and cook the feed for the cows; but if the number of animals is small, the quality of the very best, as when the object of feeding is anything but making milk for market, he had better make his stables as warm and comfortable as possible, and feed his hay whole and raw, rather than incur the expense and extra labor necessary for steaming food. We also believe that many who have adopted steaming and have, at the same time, made their barns warm and comfortable by tighter covering, or by the fire from the furnace, or by both, and have also warmed the water drank by the cows, would find it not a little puzzling to decide just now how much of the improvement in the condition of the animals, the increase in the amount of milk, and the saving of fodder is due to steaming or cooking the food, and how much to the general improvement in the care and management of the animals which usually accompanies the introduction of a steamer on the farm.

SULPHUR OINTMENT.

THE North British Agriculturist says:—Sulphur ointment is generally prepared by melting one pint of flowers of sulphur with four or six of lard, palm oil, or other fatty matter. For mange, scab, and some of the simpler inflammatory conditions of the skin of animals, sulphur ointment proves a soothing dressing; but it is by no means the most effectual application for the destruction of those vegetable parasitic growths popularly known as ringworm. For such purposes, if sulphur ointment is used, it is advantageously mixed with about one part of the dark brown, impure carbolic acid to six or eight of sulphur ointment. Silver nitrate, zinc chloride solution, copper and iron sulphates, and other such powerful astringents and antiseptics, applied carefully in tolerably concentrated solution, destroy the vegetable parasite, and thus prevent the complaint spreading. In most cases where the bare circular spots of ringworm first show themselves, they are easily arrested by the inrubbing of any common oil or saline astringent solution, especially if the animals are not exposed to fresh spores of the disease usually developed amongst damp old straw, and particularly prone to occur where barley straw is chiefly used, whether for food or litter.

Farm Economy.

SUGGESTIONS ABOUT MANURES.

The farmers of this country have much to learn from the market gardeners. These last have devoted far more time to experimenting and have made careful and minute tests of facts in the line of their business which the great majority of farmers cannot afford. This is especially true with regard to manures, and as these are equally necessary in farming and gardening, the interchange of information cannot fail to prove valuable. We would have all farmers purchase and carefully study such standard works as Henderson's Gardening for Profit," together with the numerous manuals and catalogues issued by gardeners and seedsmen. Any thinking farmer will find much in all these which he can make available in his own business. From the "Garden Manual" (issued by J. B. Root of Rockford, Ill.,) we copy the following practical and suggestive ideas about the use and action of manures:

Hen manure, when mixed with enough soil to work fine, has special fitness for the onion crop, as it can be applied to the surface where wanted, has no weed seeds, and is exceedingly valuable, being little less than guano.

Leached ashes have an especial value on sandy soils, and produce most effect on onions, potatoes, corn and the root crops. Their value is lasting, and the effect of a liberal application will be noticed for years, and if not to be hauled more than three miles, their use is profitable.

Unleached ashes have a most marked effect when applied broadcast over onions partly grown—in fact, it is one of the most valuable special manures for this crop, and is worth for this purpose twice the amount paid by soap makers. For all garden crops they are valuable; potatoes, turnips, beets and peas deriving most benefit next to onions.

Lime is of most value on rich, old soils, its effect being to unlock and release fertility already in the soil, but inactive or insoluble. Hence upon poor soils it may sometimes do more harm than good; but used upon rich, old garden soils, its use occasionally will produce astonishing results.

Superphosphate of lime produces a very quick effect; and besides the fertility it adds to a soil, the rapid development it aids in plant life enables the roots to lay hold of much food they would not otherwise. In the garden it is of especial value to hasten growth while plants are still small and unable yet to reach coarser manures, and also to touch up and bring forward any portions of crops which seem to need further help. While depending chiefly on stable and green manures, yet we always find profitable use for more or less superphosphate.

In the garden, land plaster is exceedingly variable in its effects. Some of the most marked benefits from its use have been noticed upon vines during a drouth. If applied over the surface of the hill and vines during a drouth so severe that the leaves droop at midday, they will, in a couple of days, show no signs of drooping but exhibit unusual vigor. While in this section we sometimes use it without any perceptible effect, in Michigan it tells wonderfully upon clover and generally upon other crops.

Brewers' spent hops are in some places so abundant as to be an important fertilizer, generally one load being equal to two of stable manure. But I have found them most valuable, when well rotted, for raking into the surface of seed beds in which are raised cabbage, celery and other garden plants, since they retain moisture, keep the surface loose and light, and in every way favorable for the successful growth of plants. In like manner it is excellent for any plot where you wish a most vigorous growth—those vegetables for the Fair you know—since it furnishes abundant fertility, while it keeps the soil in the best condition for growth.

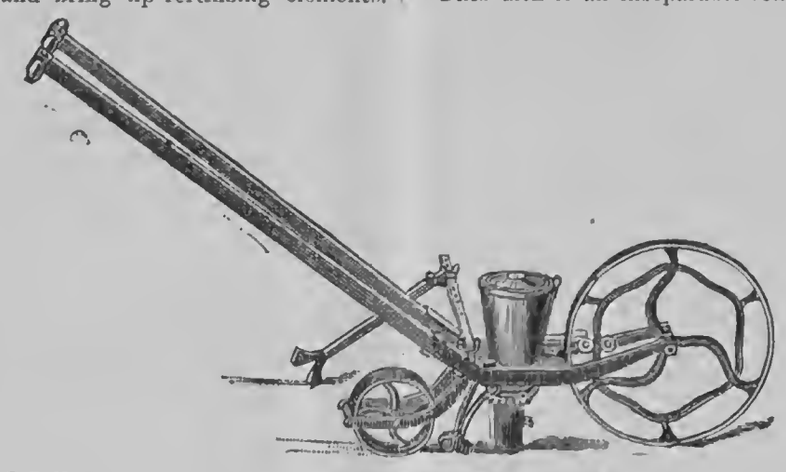
HOW CLOVER FERTILIZES.

It is a well known fact that clover has the singular property of being able to extract from the atmosphere, without the aid of manure or stimulants, nitrogen sufficient for its own proper growth and nourishment. The straw and roots of the clover contain a large amount of nitrogen, and these, when plowed down, are therefore as valuable to the next crop sown as a copious supply of guano.

The above paragraph is floating through our exchanges without credit, and we don't just now know where it originated. It is a good illustration of the facility with which theories positively stated find acceptance as if they were principles established by scientific research. Let us examine the statements in detail.

It is *not* "known" that clover does or can derive from the atmosphere all the nitrogen needed for its own growth. Only a few years ago scientific men denied that plants absorbed nitrogen through their leaves. Later investigations almost prove that this is a mistake. It is now probable that all plants have the power of absorbing some ammonia or nitrogen from the atmosphere and also probable that clover and other broad-leaved plants possess this power in greater degree than narrow-leaved plants.

But clover also undoubtedly derives some and probably many of the elements needed for growth from the soil. Its long, deep roots strike into the subsoil and bring up fertilizing elements.



HOLBROOK'S NEW REGULATOR SEED DRILL.

potash, phosphate of lime, and possibly nitrates that have been washed downward. By loosening the subsoil clover roots undoubtedly promote fertility in another way, by enabling it to absorb the nitrogen always present in the atmosphere. It is possible that it is mainly thus that clover makes the soil fertile.

However, we may differ as to the reasons and the means by which clover enriches the soil, there can be no question that it does do so. The practical fact is indisputable that good farmers do and should sow as much clover as possible for the benefit of their farms. The why and wherefore need not trouble anybody much until we learn enough facts to answer all questions satisfactorily.

DRILLING FERTILIZERS WITH GRAIN.

Eds. Rural:—Can the attachment for fertilizers on the Farmer's Favorite Grain Drill sow or distribute manure made on the farm, or can the manure be prepared so as to be sown by it to a certain satisfaction? Does it drop the fertilizer in the row on the wheat sown, so as to be covered by the same soil as the grain sown?—A. H. Moroan, *Fort Collins, Colorado.*

It is impossible to drill any fertilizer with seed unless such fertilizer is finely pulverized. Most manures made on the farm are too bulky and coarse to be drilled. Even guano or superphosphate has often to be run through a sieve to enable the drill to work well. Most barnyard manures are also too bulky in proportion to their strength, to make them worth applying in such small quantities as is possible with a drill. Hen manure, heated just enough to evaporate its moisture, and then dried and pulverized or mixed with gypsum, could be drilled with seed and would produce a good effect; but even this we should prefer to use in some other way. A small handful could be dropped in a hill of corn at planting time with half the trouble needed to fit it for drilling in. The fertilizer and the seed fall through the same tube and are covered by the same soil. The seed, however, rarely comes in direct contact with the manure, but is always very close to it.

THE ESTEY ORGAN.

Our own practice has been to not use more than 200 lbs. of superphosphate per acre. This drilled with the seed will give as much advantage to the crop as 400 or possibly 500 lbs. of fertilizers sown broadcast. Perhaps in Colorado superphosphate may not be needed. Let our correspondent hire a drill with fertilizer attachment instead of buying one. If it brings good results he may feel safe in buying not only a drill but fertilizers as well. It will not pay him to buy a drill expecting to work up manure made on the farm fine enough to use it.

Our Premium Articles.

HOLBROOK'S REGULATOR SEED DRILL.

This drill is an inseparable companion of the gardener and farmer, and is probably more widely known than any other implement of its kind. Various improvements have recently been made which must still further commend it to popular use. One of these is the open white seed conductor, which no other drill is authorized to use. This enables the operator to know at all times whether the drill is sowing, and also to judge pretty closely the amount, thus often preventing bed "bolts," missing the seed where the gardener supposes it is being distributed. The Holbrook Drill is not liable to get out of order, and is sure to give perfect satisfaction in every respect. Its price is $12. We will send one for 8 subscribers to the Rural at $2.65, or for 18 at $2.15 each.

THE ESTEY ORGANS.

The increasing wealth and intelligence of our people is most strongly shown in the number and variety of articles widely distributed which minister to taste and æsthetic enjoyment. We have passed the hardening and materializing era of our civilization and entered on that in which our moral and intellectual forces will assert their rightful predominance. Among the influences which will mold the future of our country, musical taste, ministering to ideas of beauty as well as of comfort, and endearing still more the memory of Home and its pleasures, must be prominent, and probably nothing has done more to encourage this than the popularization of music by means of reed organs. There are many different manufacturers, each making various styles, and, despite hard times and panics, the demand for all continues with but little abatement. If money is hard to get, more people have learned its better uses, and are devoting it to educating the nobler faculties of the soul rather than to merely sensual enjoyments, or to dwarfing the mind by making it the slave of a miserly passion for money and worldly goods.

Prominent among these instruments of musical education are those made by the Estey Organ Co. of Brattleboro, Vt. They are finely modeled in wood which has been thoroughly seasoned, standing the vicissitudes of any climate, and this is a very important point, for on it depends the durability of the delicate interior works, which, with badly-seasoned wood, are sure to warp and be seriously injured. The interior musical arrangements have by successive improvements been brought as near perfection as possible, giving forth tones clear, rich and sweet. We can unhesitatingly recommend these organs to lovers of sweet, rich music, and with this view we have placed one of them among our list of Extra Premiums to Agents who do the best work for the Rural New-Yorker previous to the 1st of March proximo. These Extra Premiums are in addition to our very liberal Specific Premiums, and should stimulate to increased endeavors to obtain some of the valuable prizes offered.

Pisciculture.

SALMON FISHING ON THE NOYO RIVER.

E. J. Hooper of San Francisco, writes to the Forest and Stream about salmon fishing in California. The Noyo river is about two hundred miles north of San Francisco:—"Our mode of warfare in these waters at this season was with the large red and silver spoon bait armed with a triangle of hooks, trolling with rod and reed from the boat's stern. One of us rowed alternately while the other fished. Our boat was rather too heavy to row very fast, which we found the best way to entice the fish to our spinning spoon bait. The first day or two we only took seven fish, but we soon discovered what was the most killing spoon, which was a rather large one with much red about—that is, one side of the spoon red with a small bunch of red worsted between the triangle of hooks. In seven fishing days at this point we captured seventy-three salmon, weighing in all 648¼ pounds, and averaging 8¾ pounds each. They were of the hook-bill species, of good game qualties, but inferior for the table compared with the Sacramento river salmon, being rather dry and not so tender in flesh. Their average weight is also far from being as large, as the biggest we took was only thirteen pounds, while the finer shaped and much better flavored Sacramento *quinnat* species average 27½ pounds each. Neither is the hook-bill kind so handsome in the mouth and head as the San Francisco market salmon from its bay and tributaries. The hook-bill has its upper jaw projecting under its lower, both jaws being armed at their ends with tushes or teeth, which are much larger in the males, as are also their hooked bills. Toward winter the finer and more perfect Sacramento sort appear in the northern rivers after the hook-bills, as do also toward spring the still more valuable salmon trout, that are longer in their bodies, more delicate and nice in their flesh, which is of a much lighter red color. They very much resemble the best specimens of our salmon in their silvery luster, but their heads are slightly smaller, and the shape of their tails is nearly square compared with the forked ones of the former. These salmon will only take the fly in the spring of the year, as we were informed and found by our own experience."

TREATMENT OF GOLD FISH.

Having been frequently asked for advice in the management of gold fish, will you kindly allow me to inform the ladies who read your paper that rice paper is the best food, with a crumb of raw meat now and then, minced as small as meal seeds. A piece of the rice paper the size of a four penny bit for every fish, cut small, once a day in summer, and every other day in winter; fresh water every second day in summer, and thrice a week in winter. In frost, the water should be drawn from the cistern and allowed to stand a while in a room where there is a fire in it before placing the fish in it,; this takes the chill off the water, which might kill the fish. If the fish becomes moldy, it may be taken off by a gentle touch of a little bit of sponge, or soft muslin cloth. The globe should never stand in the sun.

The following paragraph appeared more recently in the Scientific American:

For each quart of water only one fish; as gold fish cannot thrive if crowded. Do not change the source of water, whether from well or hydrant. In summer renew it daily, in winter only every second or third day. Shallow glass dishes should not be used. They should be deep, and kept in the shade, strong light and a heated room being detrimental to the fish. The bottom of the globe should be covered with smooth gravel to absorb the excrements and keep the water clean. In changing the water for cleaning the globe, take out the fish with a fine net, but never with the hand. Do not feed them with bread or cake, or any food containing tannin, but give them wafers, and eggs, flies, yelk of eggs, water cress, &c., but only once in three or four days, and then sparingly. In the months of November, December, January and February the fish should not be fed at all, as this is their hybernating season, and food in this season is unnatural. In March, April and May they should be fed little.

The Voracity of Pickerel.—According to M. Peupion, who has been practically investigating the subject, a pickerel will eat 47 pounds and four ounces of fish per pound of its own weight per year.

The Horseman.

ABOUT TROTTING WORKING HORSES.

WILL some one of your readers, who is experienced in such matters, answer me the following through the columns of your journal, viz: Whether it is better to trot work horses drawing an empty wagon going for a load, or to trot them when returning empty, the day's work having been done. I am aware that work horses should never be driven faster than a walk, but when necessary, as in the above case, I should consider the latter the best, as to adopt the former would be, in my opinion, to tire your horses just at the time that they needed all their strength.—KANSAS SUBSCRIBER.

If more pains were taken to break colts into fast walking it would not be necessary to trot them in intervals between hard work. Trotting is a hard pace for a horse on a hard road-bed, and more horses are prematurely disabled by fast driving to and from market than by the severest work they do upon the farm. Still, if a horse is kept in good working condition, he ought to and will want to go faster than a walk when drawing an empty wagon, and, in such cases, most working horses will not hurt themselves by fast trotting. Often the team is as anxious to get to its crib and feed of oats as the driver is for his supper, and we don't know why it should be held in, to the discomfort of both. As for whipping or urging a poorly-fed or hardworking horse, either to or from work, it should never be allowed. It is much better to take the Irishman's advice and "put the whip in the manger."

BIG JAW AND ITS REMEDY.

THE Live Stock thus speaks of this disorder: This is more properly called "dilation of the jaw bones." In horses it is sometimes called "big head;" it is a bony tumor, in which the interior of the bone is absorbed, sometimes leaving a mere shell of bone divided into cells, containing purulent cheesy matter. This is supposed to be caused by a deficiency of phosphate of lime in food, rendering the bones deficient in this most important element, and the following prescription is often given with good result: Phosphate of lime, 6 oz.; powdered golden seal, 2 oz.; powdered sassafras, 3 oz.; powdered ginger, 2 oz.; oatmeal, 4 lbs.; mix. This will be divided into sixteen parts, one given in the food every night. This will have a tendency to restore the missing elements in the bone. And the general diet should be food rich in phosphates. You may get your phosphate of lime by boiling beef bones in lye of wood ashes, and after it is reduced fine, wash with water and give a small quantity daily in food. The first thing to do surgically is to open it and let out any matter that it contains. Having removed the matter, inject the cavity with weak pyroligneous or weak carbolic acid. This will cleanse it and render healing possible.

MARES' MILK FOR FOOD.

MR. ALEXIS ELISHOFF, a Russian gentleman, visiting America for the study of its dairy practice, thus referred to mares' milk after visiting the "Western New York Dairy Farm." Three years ago, while traveling in Eastern Russia and Tartary, I became accustomed to the use of this milk for food. When the natives first offered it to me I was very much set against it, but habit and example rules us in the end, and in a few weeks I could drink down a bowl of mare's milk with as keen a relish as any wild Tartar. An intoxicating beverage is also produced from this milk that the people of Tartary drink. It is called *koumiss*. The mode of making it is very simple. Place the milk in a leather bag. Into this new milk put a quantity of sour milk, and shake it up several times a day for three days. In this manner a kind of spirits is produced that is very intoxicating.—*London Ag. Gazette.*

This "Koumiss," as may well be imagined from the description of the method of its manufacture, is a filthy and disgusting potation—unendurable to any but the most depraved appetite. Only an inveterate toper could relish it, and he only in default of other intoxicating liquors. As for using mare's milk as food, we believe whenever a mare gives milk there is always a colt needing all that its mother can supply.

INTESTINAL PARASITES IN HORSES.

ENTHUSIASTICALLY following up his specialty, looking everywhere for worms, and ascribing to them many and varied ailments, Prof. Cobbold marshalls a considerable amount of evidence to show that colic in horses is frequently in this country, as well as in India, produced by the ascaris, strongyli, and other internal worms. Over 1,200 ascarides he mentions as having been removed in a post-mortem examination of the intestines of one unfortunate horse. It is a pity we have to record of the sensations, the gastric arrangement, the thriftless appearance of this much-afflicted animal. What an amount of food these voracious vermin must have devoured; how in their movements they must have irritated the intestines; rolled in masses, as they often are, they must frequently have formed an almost hopeless obstruction. Thankful would this wretched victim be to shuffle off this mortal coil.

CHICCORY ROOT FOR HORSES.

A WRITER in the Germantown Telegraph says:—I once raised 1,800 bushels of chiccory roots on Long Island. The roots look like parsnips, and are as easily grown as carrots or other roots. I found my horse very fond of the tops. I also fed the trimmings in winter in place of grain. I had half a ton that got moldy after drying, so much so that I did not attempt to sell it. This I fed to my horse the next summer in place of grain, about one peck a day. He kept fat on it with no grain; and as it is very bitter it is a sure cure as preventive of worms and bots. I never raised any seed, but it can be obtained at most general seed stores. Sow same as carrots, sandy or loose soil preferred. I think farmers would do well to try it on a small scale. I am sure chiccory is worth double of carrots for horses.

A WORM IN A HORSE'S FOOT.

The Scientific American is responsible for the following: A horse was taken to a veterinary surgeon recently to be cured of a corn in the foot. In paring the corn the operator found a worm about ⅝ of an inch long, 1-16 of an inch thick, and sharp at each end as a needle. One end was black and the other end white. The black end was nearest to the sole and the white end was in the flesh. After removing the worm and burning with nitric acid the corn was entirely removed and the horse permanently cured of his lameness.

Preventive of Epizootic.—A correspondent of the Baltimore American says that he prevented his horses from having the epizootic by an expectant treatment, and that friends used the same means with success. He dissolved one teaspoonful of crystal chlorate of potash in a bucket of water, this amount making a morning dose for four horses. Another dose was given at night. A dose at noon is recommended if the disease is developed.

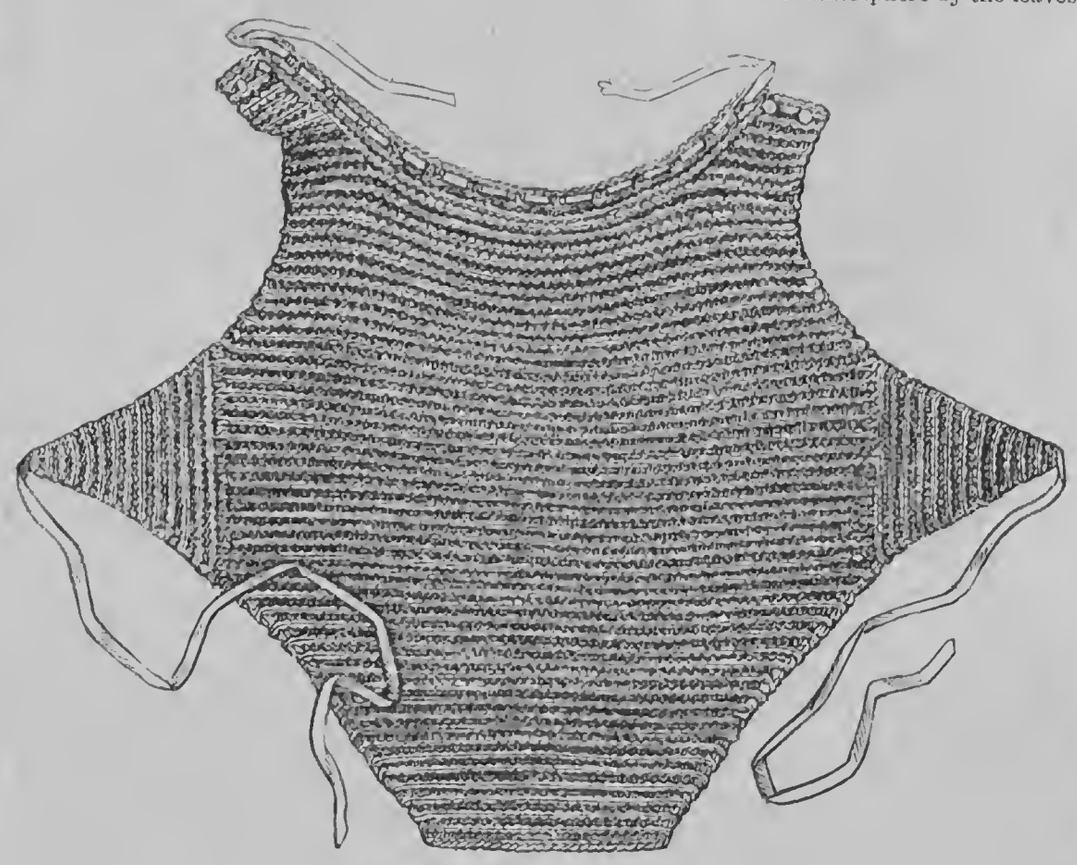
Modes and Manners.

A CHEST PRESERVER.

OUR engraving represents a chest preserver which may be easily made by any one who can knit,—and we believe many still do, notwithstanding the introduction of knitting machines. The material is Shetland wool. The work is plain knitting, the details of which are so plainly shown in the illustration as to require no explanation. For persons with weak lungs, these preservers are of great use and comfort.

TRIMMING FOR UNDER-LINEN.

WE illustrate a specimen of trimming for under-linen, etc., which most of our lady readers will readily understand. The edge is worked in buttonhole stitch. The cross band is ornamented with narrow, diagonal tucks. The frill is on the bias.



A CHEST PRESERVER.

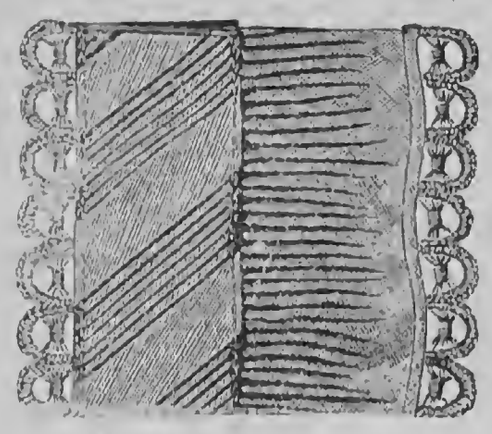
LIGHT COLORS will prevail in Milliners' materials this spring. Black bonnets are by no means to be abandoned however.

Scientific and Useful.

THOUGHTS ON PLANT GROWTH.

FROM a paper by J. V. H. SCOVILLE of Paris, Oneida Co., N. Y., read before the Central N. Y. Farmers' Club, we take the following:

Within the past quarter of a century there have sprung up on the continent of Europe a corps of observers whose investigations have done much to lift the darkness which surrounds the growing plant. Boussingault in France, La-



TRIMMING FOR UNDER-LINEN, ETC.

vees and Gilbert in England, Wolf and Fleischer and Pugh and Knop in Germany, have given much of their valuable lives to the solution of these problems. Professor Johnson found a cubic foot of wheat soil from the southern part of Onondaga County to weigh, when dry, 86½ pounds. In this proportion an acre to the depth of one foot weighs 2,768,000 pounds. This soil contains a large proportion of slaty gravel. Common arable land varies between 80 and 90 pounds per cubic foot, while very rich, mellow soils are lighter, peat soils weighing from 30 to 50 pounds per cubic foot. Taking these facts into careful consideration, we are able to comprehend how large an amount of available plant food nature generously provides upon an acre of land, and this is seldom used in American culture, for there are few farmers who stir the soil to the depth of 12 inches. There are some few favored spots where nature seems to restore itself and supplies with a generous hand the plant food abstracted from the soil by the growing plants. This is especially noticeable in some locations in the Mohawk river valley and in locations where annual overflows leave a rich deposit; and it is remarked that the rich valley of the Scioto river in Ohio, though bearing wheat and corn for 60 years, shows no perceptible exhaustion. The great proportion of our soil being upland, the ingredients composing it are coarser and to the cubic foot it is heavier, and as a consequence there is less available plant food. The sources of supply are the application of manures, phosphates, nitrates, &c. The more thorough is the tillage of the soil, the finer its pulverization; the more frequently it is stirred the more vigorous and healthy are the growing plants. This frequent stirring of the soil facilitates the absorption of ammonia and nitric acid for the uses of the plant. Rain water has been frequently analyzed for ammonia and found in minute quantities, and this property may also be absorbed from the atmosphere by the leaves.

I have observed these influences more perceptibly in the cultivation of the hop than of any other plant. At that peculiar season of growth when it is just in the burr, I have noticed that with many hills the growth was apparently stationary; but when I used the plow and the cultivator freely and threw fresh dirt about the hills, new vigor seemed imparted; often a change was perceptible in a few hours. Boussingault experimented with the very fertile soil of his garden, which was especially rich in nitrogen which, were it in the form of ammonia, would be equivalent to more than seven tons per acre taken to the depth of 13 inches; or if existing as nitric acid, would correspond to more than 43 tons of saltpeter at the same depth. The same authority made some beautiful experiments with the sunflower. In a soil destitute of nitrogen was obtained a crop weighing (dry) 4.6 times as much as the seeds. In a second pot, with the same weight of seeds, in which the nitrogen was doubled by adding ,0033 of a gramme in form of nitrate of soda, the weight of the crop was nearly doubled—was 7.6 times that of the seeds. In a third pot, where the nitrogen was trebled by adding .0066 gramme in form of nitrate, and the crop was nearly trebled also—was 11.3 times the weight of the seeds. The experiments were also continued by using garden soil which already contained a certain proportion of nitrogen, and beyond a certain proportion there was no perceptible increase in the weight of the crop.

The Garden.

SEED FAILURES.

THE following are some of the principal causes of failure of seeds:

1. Some cultivators, through ignorance or forgetfulness of the fact that the products of a garden, being natives of various soils and climates, require peculiar management, deposit their seeds in the ground at an improper season. The early and most hardy species and varieties should not be planted until the ground can be brought into good condition, as some species of plants that in an advanced stage of growth will stand a hard winter, are often cut off by a very slight frost while young, especially if exposed to the sun after a frosty night.

2. Some species of seeds, such as bean, beet, cabbage, lettuce, radish, salsify, turnip, &c., being from their nature apt to vegetate quickly, are often destroyed while germinating, through variableness of the weather, and some are liable to be devoured by insects in 48 hours after they are sown, and before a plant is seen above the ground, unless a suitable remedy is applied in time to annoy the insects.

3. Some species, as carrot, celery, leek, onion, parsley, parsnip, spinach, &c., being naturally of tardy growth, taking (in unfavorable seasons) from two to three or four weeks to vegetate, are apt to perish through incrustation of the soil, or other untoward and unaccountable circumstances which cannot always be controlled.

4. The failures often occur through seeds being deposited too deeply in the ground or left too near the surface. Sometimes, for want of sufficiency of seed in a given spot, solitary plants will perish, they not having sufficient strength to open the pores of the earth, and very frequently injudicious management in manuring and preparing the soil will cause defeat.—*Dreer Circular.*

EFFECT OF CAMPHOR ON SEEDS.

CERTAIN curious and all but forgotten experiences of much interest to agriculture and gardening have lately been revived by a German savant. Very many years ago it was discovered and recorded that water saturated with camphor had a remarkable influence on the germination of seeds. As of many other useful hints, the stupid world took no notice of this intimation: but a Berlin professor, having seen the record of it, appears to have established the facts that a solution of camphor stimulates vegetables as alcohol does animals. He took seeds of various sorts, some being three or four years old, and possessing a slight degree of vitality, and placed them between sheets of blotting paper. Some of these he wetted with pure water, and others with camphorated water. In many cases the seeds did not swell at all under the influence of the simple moisture, but in every case they germinated where they were subjected to the camphor solution. The experiment was extended to different kinds of garden seeds, old and new, and always with the result of showing a singular awakening of dormant vitalism and a wonderful quickening of growth. It also appears from the professor's researches that the young plants thus stimulated continued to increase with a vigor and vivacity much beyond that of those which were not so treated. When pounded camphor was mixed with the soil, it appeared to exercise a rather bad effect upon the seeds. The dose in this latter case was possibly too strong. At all events, this action of camphor is worthy of an examination by seedsmen and gardeners, and even farmers might determine how far wheat and barley may be profited by the strange power this drug appears to possess over the latent life of vegetable germs.—*Horticulturist.*

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near NeW York City.

ORNAMENTAL-LEAVED VEGETABLES.

Feb. 14.—To advise the culture of some of the ornamental-leaved vegetables as "window plants" may strike the lady readers of the RURAL NEW-YORKER as more a freak of odd fancy than good taste. Still, I am inclined to believe that where usefulness and beauty can be combined in the same thing we should consider it an additional merit of some moment. For my own part, I think a finely-grown plant of curled parsley far more beautiful and ornamental than many of the exotic or native ferns so frequently extolled by florists and dealers in such articles. The habit of the parsley is as graceful as any of the smaller kinds of ferns, and none can excel it in richness of color. Besides this, the plant will grow readily under circumstances that would be totally unsuited to ferns, and then, when a dish is to be garnished, the best material for this purpose is ready at hand, no thanks to the green grocer or market gardener. Parsley plants cost nothing, are easily grown and very common; but this should not be an objection with people who do not let sentiment outweigh practical common sense in the management of their household affairs. A pot or two of parsley, and the same of thyme, spearmint, peppermint, peppergrass and lavender will, in most instances, prove far more useful, as well as ornamental, than hundreds of the tender exotics usually recommended for window culture. Even a well-grown carrot, with its feathery leaves, is not one whit behind some of the rare ferns for which our florists charge a dollar or two per plant. If we desire something more "lofty" as well as showy in this line, some of the new varieties of curled kale or borecole will supply the want, and they are really grand plants, especially the "triple-curled," with variegated leaves. I think some slight change in the direction named would be quite beneficial, even if the ever-present rose and pennyroyal geraniums, oleanders and abutilons have to be laid aside to make room for some of the more ornamental and useful vegetable plants.

WHAT ARE YOU GOING TO PLANT?

Feb. 15.—This is a question that I am frequently asked at this season by my neighbors and correspondents, and I might as well answer all at once and thereby save time. Of course the question is not always propounded in quite so broad and indefinite language as given above, but that will cover the whole field, from early peas to late turnips.

TOMATOES.

I have not found anything better for an extra early sort than the *Conqueror*, although the difference in time of ripening between it and the *Canada Victor* is no greater than that seen on two plants of either variety growing side by side. For the general crop and real old "stand-by" tomato I have found nothing to equal the *Trophy*. Plants of the first and last-named sorts are now growing in my greenhouse, preparatory for setting out at the proper time.

EARLY PEAS.

If I raised vegetables for market, I might be induced to sow *Dan O'Rourke*, *Carter's First Crop*, and similar tasteless sorts, which do well enough for city people who never get anything better, and consequently are not supposed to know the difference between a first-rate article of this kind and one that is really inferior. *Laxton's Alpha* will, however, pass for a very good early sort, and the same may be said of *McLean's Advancer*, both being valuable for their earliness and good flavor. At the time of sowing those sorts I put in *Champion of England*, which will be fit for the table about the time the last of the *Alphas* and *Advancers* are gathered. I have "beat all about the bush" trying a dozen or more of the newer and highly-extolled sorts, but finally came back pretty well satisfied that the "old" *Champion of England* is second to none of the late varieties.

BEETS.

For early and table use, the *Early Bassano* has no superior, in quality, but if one prefers a deeper colored sort the new, *Red Egyptian* may be selected in preference. For use late in the season, the *Long Blood Beet* is one of the very best.

For feeding to stock I still prefer the *Red Mangel*, to any other. Last year I tried *Lane's Improved Sugar* beet, with the *Mangel*, and the result was, that the latter yielded twice as much as the former. There is also a great difference in the keeping qualities of the two sorts, both having been placed in the same cellar. I now find the *Mangel* as sound as when gathered last fall, while the *Lane's Improved* is not only rotting badly, but even the best specimens are light and spongy. On a different soil the result might have been different.

CABBAGES.

For a very good variety there is not much choice between the *Early Wyman* and *Early Wakefield*, either in quality or certainty of heading. But if I were growing cabbages for market, and in a climate where it was difficult to get good, solid heads, I would plant the *Winningstadt*, although I consider it one of the most inferior sorts ever introduced. In case of a war the heads might be used as conical shot for some of our old smooth-bore cannon, for they are usually hard and tough enough for that purpose. I tried this much extolled sort some fifteen years since, when first introduced, also from time to time since, but could never discover anything meritorious about it, except that it never fails to give solid heads. For late or winter cabbages there are many good sorts, but *Foster's Improved Brunswick* and *Curled Savoy* may be relied upon as excellent varieties for the table.

CAULIFLOWER.

The *Half Early Paris*, has always succeeded so well with me that I have had no cause or desire to look for anything better. The heads are large, solid and of fine flavor, and it succeeds well, even in a light, warm soil, if made sufficiently rich.

CELERY.

The new dwarf varieties of celery have of late years been extolled by our market gardeners, but under ordinary culture the "giant sorts" grow none too rapid or tall to insure a fair show of blanched leafstalks. I have had a pretty good opportunity of seeing all the fancy sorts as sent to New York City markets, but none of them are in my opinion superior for ordinary garden culture and home use to the old *Seymour's Superb White* or *Cole's Superb Red*.

SWEET CORN.

Of course I shall try the *Triumph*, and *Brigg's Early*, but at the same time depend for a main crop upon *Moore's Early Concord* and the old *Stowell's Evergreen*. When I find anything better it will be time to change. My experience with the extra early dwarf sorts leads me to think they are very much like the "extra early" varieties of peas; *i. e.*, very poor in flavor. The Black Sweet Corn is really the best flavored variety I have ever cultivated, but the color is objectionable.

TURNIPS.

Among the Ruta-Baga section the *Sweet German* is undoubtedly the finest flavored of all, although not quite as prolific and large as some other varieties. Among what are usually termed the "flat turnips," the seeds of which are sown later in the season, *Robertson's Golden Ball* pleases me best. It is a handsome, fine flavored variety and a good keeper.

POTATOES.

For my own use I shall plant *Alpha* and *Snowflake*, having tested both for the past two years, I have little hope or even desire for anything better in the way of potatoes.

The above is not all the kinds or varieties which I shall plant this spring, but the list will answer as far as it goes in reply to questions of some of my correspondents.

Arboricultural.

NATIONAL FOREST CULTIVATION.

THE Germantown Telegraph remarks on a subject wherein the Agricultural Press of the Country is almost unanimous:—"It is really astonishing how easily ill-considered matters like these can obtain a hearing and even approval before a body so generally intelligent as are the men who compose the American Congress. The project now is to appoint a Commissioner of Forestry, to take charge of American forests, with a view to their preservation. This is, we believe, the third year that the attempt has been made to found this new Department; but though twice defeated it seems bound to rise again.

"We all know now that much that has been said about this forest-tree subject is the veriest trash, and has been kept before the public systematically no doubt for the interest of a few who want to be constituted a Board of Commissioners. There is, so far as the practical question is concerned, nothing for such a commission to do that the Agricultural Press of the country has not already done. We—all of us—have pointed out that there is a waste of timber going on; but this waste of timber has no bearing, or very little, on our future supply. Where timber is wasted, it is generally in localities where it is really worth little because it is not near any place where it can be marketed, nor would it be for many years, and therefore it is cut down and burned to make way for farm-crops. Wherever it is near to any such market, or near to a prospective market, it is seldom destroyed. It needs no law for its preservation under such circumstances. Americans can see questions of profit and loss as quickly as any, and will not wantonly destroy that which will make them rich. As for timber outside of civilization, people talk of preserving it as if a tree were rocks and stones and would last for ages. Most of our great Western forests have already reached mature age and are on the downward road. Many of these are between one and two hundred years old, and it is believed that very few American trees reach an age of three hundred years. It is impossible to preserve that which nature has doomed. How are "Commissioners" to "preserve" them? Even were they much longer-lived than they are, the chief trouble comes from forest-fires much more than from the woodman's axe. Can a Commissioner prevent the sportsmen's wad or the spark from the locomotive?

"What we really want is not so much the "preservation" of the old forests in the far-away parts of our great country, as the encouragement of new plantations; and this planting is not a work for the General Government to do, which does not propose to hold public lands."

TRENCHING AMONG TREES.

TRENCHING is still practiced in England, but in this country it has gone mostly out of fashion. The subsoil plow pulverizes the soil so much more cheaply than can be done by hand that it will always retain the preference where labor is as dear as here. Trenching, however, admits the manuring of the subsoil, which subsoil plowing cannot well do. Trenching orchard ground is found particularly beneficial where manure is digged in about the roots. Mr. DANCER of Chiswick, Eng., practices trenching in orchards extensively and grows great crops of fine fruit. Fresh-feeding rootlets start from the old roots where cut off, and, finding well-manured soil, supply the tree with abundance of food. It is always important, where roots of trees are to be pruned, that it be done while there is least activity—in spring before buds swell, or in fall after the leaves have fallen. Orchards plowed in midsummer receive a severe check, which the roots do not easily recover from, while in early spring plowing may be done without injury, and, if the soil is sufficiently rich, with positive benefit to the tree. It is better not to plow fresh manure under in immediate contact with the roots. Its fermentation might cause fungus and disease to attack the tree. The better plan is to spread manure on the surface in fall or winter, and let snows or rains carry its fertilizing properties downward.

CULTIVATION OF SUMAC.

NOT long since the Pacific Rural Press, in speaking of the various plants yielding tannin, and while urging the culture of some of them in California, it took occasion to remark—"But there is no reason why the sumac tree may not be cultivated in California, as in Virginia and other Eastern States, with profit to the grower and with advantage to the leather manufacturing industry."

That Sumac is cultivated in Virginia or any other Eastern State, will we think, be news to our people on the Atlantic slope. We think the farmers in the "Old Dominion," and elsewhere at the East, would be very happy to be rid of this pest of fence corners, neglected fields and elsewhere, and forgo all the cash that it is possible to obtain from gathering leaves for tanning and other purposes. There is enough Sumac growing wild east of the Alleghany Mountains to supply the world with this material, but the trouble is, that the price obtained for it will not pay for gathering. Children, and even men and women who have nothing else to do, frequently earn a little money by gathering Sumac leaves, just as they do picking wild berries of different kinds, and this is about the extent of the Sumac crop in America.

BANYAN TREE.

EUCALYPTUS GLOBULUS has had its share of attention in India, and without considering the question of the truth or otherwise of its reputed value, it is proved that although it grows quickly and with vigor on the Neligherries and Khasia hills at 5,000 to 8,000 feet above the sea, it cannot be induced to live even for a year or two in the hot plains of India. Dr. King's description of the fine old Banyan tree, "one of the greatest curiosities and ornaments of the place," will, we are sure, be read with interest. He says:—"Although considerably damaged by the cyclone of 1864, which carried away two of its largest arms, this fine tree continues to grow vigorously. It now covers an area of ground 800 feet in circumference; its trunk girths 51 feet, and from its branches no fewer than 170 aerial roots are sent down to the ground, some of them being more than 10 feet in circumference. This fine old tree supports quite a colony of Orchids, Ferns, and creeping plants of about twenty distinct species, and gives shelter to innumerable birds. Its exact age is not known, but, considering how rapidly Banyans grow, it probably does not exceed that of the garden, and is therefore less than a century."

Insurance Department.

INSURANCE NOTES AND NEWS.

Prosperity of Fire Insurance.—We learn from the returns published by the insurance papers that the experiences of the fire insurance companies for the year 1875 were especially favorable to that interest. With few exceptions, all the companies doing business in this State have realized an increase of income, a decrease of losses, as compared with the average of former years, and have otherwise prospered. One hundred and two companies report their combined capital to be twenty-seven millions ($27,107,020); their gross assets, sixty millions ($60,052,978); their net premium receipts for the year, $22,440,275; their losses, $9,723,950; their excesses (to pay expected losses), $52,852,730, and their surplus (to pay unexpected losses), quite $17,671,440. These figures are very encouraging. Fire insurance has rarely shown so many and great evidences of a prosperous financial condition. But this state of affairs may not last long. A great fire may occur at any time, and when it does, many of the weaker and least careful companies are almost certain to come to grief. It is especially reassuring to notice that the better companies are carefully accumulating surplus funds in anticipation of a repetition of the Portland, Chicago and Boston calamities, and that the imminence of some such occurrence is recognized in a steadfast adherence to rates of premiums that will pay current losses and expenses and create, besides, a large surplus for the greater security and better protection of policy holders.

An Odd Idea, But Not a Bad One.—It is said upon pretty good authority that some life insurance companies habitually inquire into the condition of their policy holders and endeavor to purchase the policies of those who are in very bad health. One prominent company has, it is stated, paid the expenses of a European tour of a heavily-insured party whom it could not buy off. A medical man in Colorado, himself an invalid in search of health, urges companies to issue policies obligating the company to loan or advance a given amount of money upon the security of the policy to the assured, in case of any chronic disorder that the physicians despair of curing, to send the insured to a favorable climate or secure favorable conditions for his recovery. The suggestion is a valuable one, and should lead to a closer study of the relations of climate to disease. The time may come when the companies will find it to their interest to send ship loads of incipient consumptives from New England to Florida, and colonize fever stricken Southerners on the shores of Northern lakes and rivers.

More Useless Interference.—A bill has been introduced by "a Senator" providing that no policy of life insurance shall be declared forfeited until sixty days after the regular time for payment of premium. Which means that hereafter, for such a law cannot be retroactive, the company shall give fourteen months insurance for the first year's premium and a year's insurance for each subsequent payment. This is simply nonsense, as are most other attempts to interfere with private contracts. The companies can defeat the measure by stipulating that the second premium shall be paid at the end of two months, or they will raise the first premium seventeen per cent. If they do neither of these things or something equivalent, the new policy holders will profit at the expense of the old—a thing not to be thought of, for a good company seeks rather the protection of the members it has than to attract new ones at their cost.

A Muddled Matter.—Contradictory statements have been received in regard to the condition of the affairs of the Southern Life Insurance Co. First it was announced that a petition in bankruptcy had been filed, stating the liabilities at $1,117,000, or about four hundred thousand dollars greater than the entire assets. This announcement is contradicted by a subsequent report that the Company had a surplus, as regards policy holders, of nearly one hundred and fifty thousand dollars. Except to those who have been led by sectional prejudices to entrust their money to the custody of political favorites, it does not much matter which of these statements is more reliable.

Farmers Should Insure.—"The barn of Supervisor S. D. BURRITT of Parma, N. Y., was burned Feb. 15. It was filled with grain, but an insurance of $2,000 nearly covers the loss. A barn was burned on the same site eight years ago." This item of news constrains us to say that all who have valuable buildings and contents would do well to have the same insured in safe and reliable companies.

An Alleged Failure.—The Penn. Fire Insurance Co. of Phila. is reported to be insolvent. We have no information except such as has been obtained from exchanges, and cannot vouch for the correctness of the report.

Domestic Economy.

HOW TO MAKE SAUSAGES.

THE Germantown Telegraph gives the following recipe for making sausages:—Having first procured a good machine (which will cost but a few dollars) for cutting sausage meat, collect your meat, containing about one-fourth fat, as taken from the hog, see that it is free from bone, sinew, gristle, &c., wash in tepid water, but do not soak it; then to every 20 pounds of chopped meat add 4 ounces of sage, 10 ounces of salt, 1¾ ounces of black pepper, 4 heaping tablespoonfuls of red pepper, and one ordinary tablespoonful of saltpetor. As there is no standard of tastes, some may think the seasoning too high, and others the ingredients too few. Everyone therefore should, to secure his own taste, try it before using the receipt upon too large a scale, This sausage is improved by age; put in casings and smoke moderately. Those desiring more flavor of sage, and less pepper, can take to every 20 pounds of meat, 10 ounces of salt, 8 ounces of sage and 1 tablespoonful of black pepper. Stir well with the hand, and pack in tin pans; when full, dip a cloth the size of the top of the pan in melted lard, and spread over the pans; then turn them together and remove to a cool place.

It is a common way among housekeepers to "cut and try," that is, add a little more salt, and a little more pepper and sage, tasting and re-tasting, and calling in the aid of the palates of others, till the thing has too much pepper and salt, and is probably spoiled. The above proportions are simple, easy and good. But should you desire to change to suit one's taste, be cautious in using the seasoning, as it is easy to add, but impossible to take out again; and remember, sausages become more salty as they dry.

SELECTED RECIPES.

Cream Pie.—One cup cream (sweet, and as thick as you can get it), two tablespoonfuls sugar, and one egg. Use one crust, making it the usual way.

Corn Cake.—One quart of sour milk, three eggs, one teacupful of flour, yellow corn meal enough to make a batter as thick as for pancakes. Bake quickly in pans well buttered.

Delicate Sponge Cake.—Use the whites of ten eggs, one and one-half tumblers of flour, teaspoonful of cream of tartar, half a teaspoonful of salt; lemon to suit the taste. Bake about 35 minutes or more.

Wild Fowl Pie.—The fowl should be trussed like a duck for a pie, larded with anchovies, and seasoned with pepper, salt, and sweet herbs; put a good quantity of butter into the pie, and flush like all others.

Washington Pie.—One cup of sugar, one tablespoonful of butter, four tablespoonfuls sweet milk, one-half teaspoonful of soda, one teaspoonful cream of tartar, one cup flour. Bake in two layers, with jelly, fruit or cream between.

Lemon Pie.—The juice and rind of 1 lemon grated into one cup of water, 1 cupful of loaf sugar, the yelks of two eggs, 3 tablespoonfuls flour. Frosting—beat the whites of two eggs, add four tablespoonfuls white sugar, spread on the pie, and bake lightly in the oven.

Apple Jelly.—Cut the apples in quarters. Do not pare or core them; dip each quarter into clear water, and put them in a jar, and place them in the oven to cook until quite tender. Strain off the juice as usual, and boil with a pound of sugar to a pint of juice. The most delicious jelly will be the result, with the full, pure flavor of the apple.

Corn Dodgers.—One quart of corn meal, a tablespoonful of lard, two eggs, a tablespoonful of salt; scald the meal with the lard in it with boiling water, cool with a little milk, add the eggs (beaten light); beat very hard for ten minutes; make them thin enough with cold milk to drop off the spoon and retain their shape in boiling lard; serve hot; have the lard boiling hot when you drop them in.

Honey Recipe.—White or brown sugar 20 lbs., soft water 6 lbs., pure bee's honey 3 lbs., cream of tartar 80 grains, essence of roses 24 drops. Mix the above in a brass kettle, boil over a charcoal fire five minutes, take it off; add the whites of two eggs well beaten; when almost cold add two pounds more bee's honey. A pint of the decoction of slippery elm, of the consistency of cream, will improve the honey, if it be added while cooling.

Ham or Tongue Toast.—Cut a slice of bread rather thick, toast it and butter it well on both sides. Take a small quantity of the remains of either ham or tongue and grate it; have ready chopped fine, two hard-boiled eggs, put both meat and eggs into a stew-pan with a little butter, salt and cayenne, and make it quite hot, then spread quickly on the toasted bread, and serve immediately.

Hulled Corn.—Soak over night in warm water, in the morning put it on in an iron kettle, with warm water enough to cover it. To each quart of corn I put a rounding tablespoonful of soda; boil until the hulls come off readily, then wash in several clear waters, and after it is thoroughly washed, put it on to boil again in clear water. Boil until tender, and then salt it and let it boil a little longer. Turn into a sieve and drain thoroughly. Eat hot or cold, in milk.

Peas Pie-Crust.—Stew the split peas as for dinner. Strain through a colander or coarse sieve. Then add equal parts good wheat meal and fine corn meal sufficient to make a soft dough. Knead well for fifteen minutes, adding mixed meal enough to make a moderately stiff dough then roll out and use as any other pie-crust. As it cooks very quickly, it is not best to put in for a filling any fruit that requires long cooking.

How to Bake Sliced Potatoes.—Pare and slice, very thin, potatoes to almost fill a two-quart dish. Sprinkle on a large spoonful of salt and a little pepper, then turn on sweet milk until the dish is a little more than half full, that will wash the pepper and salt among the potatoes. Cut five slices of pork, lay them around on the top of the potatoes. Set it in the oven and bake two hours. The pork will get cooked before the potatoes are done. Take it out and cover it up to keep hot until wanted for dinner.

Suet Pudding.—Take one cup of suet, chopped fine; one cup of raisins, chopped; one-half cup of English currants; one cup of syrup; one cup of sour milk, two even teaspoonfuls of soda. Mix the suet, raisins and currants well into the syrup; then add the sour milk; next, the soda, pulverized and well mixed in a handful of dry flour. Stir until it begins to foam, then add flour enough to form a stiff batter. Steam one and one-half hours. For a large family double the quantity will be required, and should be steamed two hours. Serve hot.

Hygienic Information.

THE SICK ROOM.

WHEN there is a sick person in the house the rest of the family should be careful to retire early at night, and to avoid all noise and confusion as much as possible. No more people should be in a sick room, when the patient is weak and nervous, than is absolutely necessary to take care of him or her. It injures a sick person very materially to use his room for the common sitting room, where all sorts of things are talked over and discussed, and newspapers are read until late in the evening. Even if the patient is not sleepy, he may become so by keeping perfectly quiet and giving his nerves a chance to become composed.

Remarks on an invalid's diet, disparaging it, should be avoided. Don't say, "I know I could not eat such stuff."—Bah! such dish-washy victuals!"—or any such remarks. If the patient's appetite is good and he eats a great deal, and some diseases demand it, do not seem to notice it. When people are sick and nervous it is easy to plague and annoy them. All disagreeable topics should therefore be carefully avoided. Doors should not be slammed nor stoves rattled. Heavy walking, loud noises, or too sudden and startling movements, are very injurious.

Respect their wishes, when it can do them no injury; an easy mind is as good as medicine. Often, if patients are given what they wish it will do them a great deal of good. The appetite craves what the system needs. Sometimes, of course, it would not do, but as a general rule it is a good plan. I have known cases where the patient craved cold water, and when given it would work wonders, doing great good. It used to be considered dangerous to give any one milk when they had a fever, but now it is recommended, LORETTA E. K. TURNER.

Chicago Junction, Ohio, Feb. 1876.

SCARLET FEVER.

IT is as unnecessary for a child to die of scarlet fever as it is that it should be blind with cataract. Let us see:—At any time before the body has finished its ineffectual struggle we are able to help it, not by wonderful medicines, but by the knowledge of anatomy, and the application of common sense. We consult the sympathetic nerve, and do what it commands us to do. We must give this child salt when it wants it; we must give it acid when it has a fever and anxiously craves it—not vinegar, but lemon juice, because the first coagulates albumen, and the latter does not, on account of the surplus of oxygen which it contains. To imitate the soothing mucus in the intestines, which is now wanting, and to give some respiratory food at the same time, we add some gum-arabic. To restore and relieve the injured nerve, we apply moist warmth.

In practice we can fulfill all this with the following simple manipulations: Undress the child and bring it to bed at the very first sign of sickness. Give it, if it has already fever, sourish warm lemonade, with some gum-arabic in it. Then cover its abdomen with some dry flannel. Take a well-folded bed-sheet, and put it in boiling hot water; wring it out by means of dry towels, and put this over the whole, and wait. The hot cloth will perhaps require repeated heating. According to the severity of the case and its stage of progress, perspiration will commence in the child in from ten minutes to two hours. The child then is saved; it soon falls asleep. Soon after the child awakes, it shows slight symptoms of returning inclination for food; help its bowels, if necessary, with injections of oil, soap and water, and its recovery will be as steady as the growth of a green-house plant, if well treated.

Of course, if the child was already dying, nothing could save it, or if it has already effusions in the lining of the heart or brain, it is much better that it should die. But if the above is applied in due time, under the eyes and direction of a competent physician, I will guarantee that not one in a hundred children will ever die of scarlet fever. I know this will startle some of my readers, especially those who have lost children already, but I shall go still further. I maintain that a child will never get scarlet fever if properly treated. If a child has correctly mixed blood, it will not catch the disorder if put in bed with a sick child. This is still more startling, but nothing is easier of proof.—*Good Health.*

CURE FOR CROUP.

A KANSAS lady gives the following cure for croup which she vouches for as reliable. She has had much experience with a child always troubled with croup—had tried hive syrup, goose grease and scores of other remedies, and finds the following better than all:

Take of honey one tablespoonful, pulverized alum one-half teaspoonful, saleratus one and one-half teaspoonful, and one-half the white of an egg. Beat all to a cream, and give one-fourth teaspoonful. This will be enough to give relief if taken as soon as the first symptoms of croup appear, which is a hoarse cough, the horror of which can be realized only by those who have heard it, and have watched night after night with a child sick with croup. If it has become necessary to vomit the child, give one teaspoonful, and if the case is a stubborn one repeat the dose in half an hour. In an extreme case, when this remedy has not been applied soon enough, she recommends to take a piece of flannel large enough to cover the throat and lungs well, grease it with fresh lard and wet it with camphor, then warm it and apply. This will relieve the hoarse breathing in a very few moments. If given in time no outward application will be necessary.

LAUGHTER AS A MEDICINE.

A GENTLEMAN was suffering from an ulcerated sore throat, which finally became so swollen that his life was despaired of, when his household came to his bedside to bid him farewell. Each person grasped his hand for a moment, and then turning, passed out weeping. A pet ape which had modestly waited until the last, then advanced, and grasping his master's hand for an instant, also turned and went away with his hands to his eyes. This assumption of deep grief, which it is hardly possible the animal could have felt, since it could scarcely have comprehended the problem of mortality there so powerfully presented to the human mind, was so ludicrous in its perfection, that the patient himself was seized with such an uncontrollable fit of laughter as to break the ulcer in his throat, whereby his life was saved.

A GOOD MEAL FOR HEALTH.

ANY one can make a good meal of three or four things—nicely cooked meat, perfectly prepared potatoes, a dish of ripe fruit and exemplary bread and butter. It is not variety or quantity that is so important as quality, and if those who cook could only realize this and precipitate all their power upon the perfect preparation of only two dishes at each meal, those who feed at their hands would certainly be the gainers. Badly cooked food is sheer waste in nerve, muscle, soul power. The hungry body vainly attempts recuperation in trying to digest and assimilate food not 'convenient' for it, so that what might have been accomplished had the food been right remains undone.

ABOUT NEURALGIA.

A WRITER in the British Medical Record attributes the increasing prevalence of neuralgia of the face and scalp to the effects of cold upon the terminal branches of the nerves distributed to the skin. Men, he thinks, are less subject to it, because they cover their heads better while in the open air. It may be observed that the surface of the head which is actually covered in man is at least three times that which fashion allows to woman. Indeed, the points of contact between the hat or bonnet and the head, in the latter, are so irregular as to practically destroy any protection that otherwise might be afforded.

Patrons of Husbandry.

GRANGE NEWS AND NOTES.

THERE are 1,400 Subordinate Granges in Kansas, with over 40,000 members.

THE Kentucky Matrons claim to have the best looking ladies in the Order to be found in the Union.

MASTER JAMES of Indiana State Grange, favors making all fourth degree members eligible to the Pomona.

THE capital of the Patrons' Manufacturing Association, organized at Indianapolis, is to be $100,000.

THE Order in Idaho Territory is progressing. There are already seventeen Granges organized and working.

THE Kentucky State Grange has adopted resolutions favoring government aid to the Texas Pacific Railroad.

THE Maine Patrons have increased so that there are 400 Granges in the State, with an average membership of 200.

THE Missouri Granger says there will be four or five Grange halls built in Macon county during the coming summer.

THE Patrons' implement store at Dixon, Ill., has saved at least 50 per cent. to those interested in it during the past year.

THE Patrons of California ask the State Legislature to fix the fees of attorneys in all cases where no contract is made.

THREE Granges and a Council of Sovereigns of Industry, in Massachusetts, have started a Co-operative store in Holyoke.

T. A. THOMPSON, Ex-Lecturer of the National Grange, addressed the Ohio State Grange which convened at Cleveland, Feb. 15.

THE Southern Farmer says the Patrons everywhere are learning that mixed agriculture pays best, affords most luxuries, and better living.

C. R. HATTON of 97 Murray St., New York City, has been appointed by the West Virginia State Grange as purchasing and selling agent for the Patrons of that State.

MORTIMER WHITEHEAD, Master N. J. State Grange, visited the Ohio State Grange held at Cleveland, Ohio, last week, and made an address there on the Centennial Encampment.

BROTHER SMEDLEY, the State Master, Vt., is working hard for the advancement of the order. He is travelling through the State lecturing and encouraging the Patrons to go on with the good work.

THE Granges of Mt. Holly, East Wallingford, Ludlow, Plymouth, Proctorsville, Rockingham, Springfield, Chester, Andover, Weston, Londonderry and Landgrove, Vt., are about to form a Pomona Grange.

THE Tennessee State Grange presents that State to the world as having advantages over all others in climate, soil, minerals, coal, timber and healthfulness, and says to all persons seeking permanent homes, Tennessee is the place.

BRO. R. M. CONWAY, State Lecturer of Virginia, has written to the Virginia Patron a letter describing a plan for getting good laborers. He suggests that each applicant for work be required to show a certificate from his former employer stating his qualifications.

THE Order of Patrons of Husbandry has developed in this country more speakers and active parliamentaries than any school or combination of colleges ever started in any country. This fact shows what an educational power there is in the Order, if used to an advantage.

THE Granges in Texas are in a most flourishing condition as a general thing, and with a few exceptions are used as schools, debating societies and social re-unions for neighbors and friends, where all teach and learn, and feel called upon to give their experiences for the general good.

THE Patrons of Alabama, Mississippi, Georgia and Arkansas recommend a reduction of one-third in the planting of next year's cotton crop, so that the farmers may do less work and get more money. The Kentucky Patrons recommend the same thing in regard to tobacco.

THE Chemung Co. (N. Y.) Grange has elected the following officers:—L. W. Bailey, M.; Geo. S. McCann, O.; W. H. Cleveland, L.; Robert Mosher, S.; Uriah Hall, A. S.; David Shappee, C.; Jonas D. Wilson, T.; DeWitt C. Curtis, S.; Mrs. James McCann, C.; Miss Julia Roushy, F.; Mrs. James Suffern, P., and Mrs. Huldah A. Hall, L. A. S.

THE Farmer's Friend says there is now a genuine Grange of genuine straight-up-and-down farmers in the city of Philadelphia. There are enough farmers within the city limits to compose two or three large Granges, as perhaps fifty square miles of the city are farming land. The Grange referred to is located in the rural portion of the city known as "Bustleton."

BETTER TIMES COMING.

FORMING our judgment upon then existing facts and favorable indications, and the sentiments prevailing among the people and being uttered by the press, we some time ago, in an article entitled "Centennial Prosperity," expressed the opinion that better times would ere long be vouchsafed this people and country—that the Centennial Year would not only restore and render permanent our former unparalleled prosperity as a nation, but cement a bond of union between these States and foreign countries which would insure peace and harmony in the future. Among other things we said:—"What we lack most is *Confidence*—in ourselves and in each other. With that, and judicious Economy and Industry, the "good time coming," which has been so long delayed that many have despaired, will surely arrive. Faith and Works will accomplish the desired object and inaugurate an era of prosperity equal to any ever known during the existence of the American Republic—whose career during the past century is unexampled in the history of nations."

Such was the outlook to us early in January, since which time there has been no change in our opinion, albeit the improvement in the times has not been so great as many anticipated. One reason is that most people expect a radical change to be rapidly brought about, whereas such a revolution as is desired must necessarily be gradual and founded upon Works and Confidence—Faith alone not being sufficient to accomplish the result. Labor, Patience, Industry and Economy, as well as Confidence and Integrity, are the great levers which must be brought into requisition to inaugurate an era of general prosperity and render it permanent throughout the country. We must not only be hopeful of success, but work for it diligently and faithfully—with confidence in ourselves and others, and a firm belief in the recuperating power of the people as a nation.

The return of prosperous times would be greatly facilitated were the Press to uniformly look upon the bright side and give such encouraging reports as the facts and indications warrant. Instead of this, however, leading newspapers in our large cities—or at least some of them—seem to take pleasure in shaking the confidence of community by gathering up and publishing the details of every business failure or fraudulent transaction; while partisan journals croak about or predict ruin caused, or to be inaugurated, by the action of political parties. Less of such twaddle, and more hopeful talk, must be the order of the day to assure and secure what the masses so anxiously and universally desire and expect—such a return of prosperity to the Industrial and Producing Classes as will be favorable to the interests of all well-doing citizens of the Republic.

This is very properly an era of Reform, though we fear too much of it is on paper (or in the papers) and in the speech of people. We hold that Economy in both Individual and Governmental affairs is a paramount duty, and the first requisite to a return of such prosperity as shall prove general and of permanent benefit to the whole country. With this, and the Industry, Business Honesty and Integrity of Character which characterized the American people one hundred years ago, the Centennial Year will certainly hasten, if not fully establish, the better times for which all classes of community have so long anxiously waited. To facilitate and hasten the coming of the era of good times all good citizens should labor—exercising their influence in such manner as to produce the desired result. Instead of croaking and cursing, we need hopeful talk, encouragement and wise admonition from the Press, the Pulpit and all exercising influence with any portion of the people. The resources of the country, its real wealth, are ample—never more abundant than now—and, instead of repining, every man, woman and minor in the land ought to thank Heaven, ignore idleness and speculation, and go to work bravely and confidently for a restoration of such prosperity as will benefit and elevate us as a People and Nation.

NOTES FROM WESTERN NEW YORK.

THE weather in Western New York, as everywhere else this winter, has been unusually mild for the season. There has been in most sections no sleighing and very little snow, but mud interminable. Heavy and continued rains have fallen, and the ground, which has been dry for two years or more, is now thoroughly soaked. The severe winters of 1873-4-5, opened the subsoil to a greater depth than had been known in years. Any light rain was speedily absorbed by this porous subsoil, and the result was that at no time has the ground been wet enough to keep springs and wells up to their natural supply. Very many wells have been dry more than a year, and though rain came abundantly in the summer, it affected the subsoil less than usual. Now we judge there will be no more trouble this year from that source.

One result of the two past dry and intensely cold winters, has been a natural underdrainage of the soil. It has really seemed to make little difference in many fields whether they were underdrained or not. Probably the good effect of opening the subsoil will be felt for some years to come, but it is specially important while fields are in their present flooded condition, that they should not be poached and trodden into mire by cattle, and when spring opens that no plowing shall be done while the soil is wet enough to "stick" to the plow. It is very important that spring grain be got in early, but it is far more important that the friability of the soil shall not be permanently injured by working while it is too wet. For a year or two past mud in spring has been only on the surface while the soil beneath has been frozen; but now it reaches deeper and requires careful treatment.

The open winter has thus far not injured wheat on the ground, which still shows a good stand. There is danger while the ground is soaked with water; but a light fall of snow protected the crop while the superabundant water passed away. In some places wheat is covered with water, and unless there is an underdrain it must be smothered. Wheat will however endure submerging several days without injury, provided the water passes off in underdrains instead of being left to dry out.

It is really gratifying to have a prospect of a season when underdraining shall produce its usual good results. During the dry seasons we have recently had, it has made little difference whether land was drained or not, and those who had made expensive improvements in that line were placed at disadvantage with their neighbors. Manures also are more effective in moist seasons; and in short, the whole economy of good farming is better prepared for a flood than a drouth—though better prepared for either than a farmer who does not keep his land in good condition.

THE CORN PREMIUMS—NEW LIST.

THE announcement made by Mr. CONRAD WILSON of a series of Premiums for corn, and which was published by us several weeks ago, has attracted much attention from farmers in all parts of the country. Since then Mr. WILSON has made arrangements to greatly enlarge the scope of the experiments and the Premiums will be increased to $2,000 or more and be given through the agency of the Centennial Bureau of Agriculture. Mr. WILSON announces that a descriptive circular is to be issued giving full details of the plan, and adds:

The object is to test the possibilities of our great national cereal, Indian Corn, in regard to the following points:

1st. The largest attainable product of shelled corn, by weight, from a single grain.
2nd. The largest attainable product of shelled corn, by weight, from one acre.
3rd. The lowest attainable cost per bushel for shelled corn.
4th. The largest attainable product of pork from 1 bushel of corn.
5th. The largest attainable product of butter from 1 bushel of corn.
6th. An experiment in corn culture to test the theory of Prof. Stockbridge. A formula for this experiment will be given in the Circular.

The premiums will comprise books, farm implements, fertilizers, plated silver ware, oil paintings, vegetable and flower seeds, art-subjects, tools, &c. They will be twenty or more in number, and the total value not less than $2,000.

The offers in the last line will amount to $800 or more, and are intended for Granges and Clubs, for the simple reason that experiments in clubs are greatly facilitated by co-operation, and the results obtained are more reliable.

In the circular to be issued the premiums will be described, and the conditions of the competition clearly set forth. All farmers throughout the country are invited to compete. As Indian corn will doubtless contribute more to the food of the human race for the next one hundred years than any other farming product, and as the present year is destined to be a memorable one in our husbandry, there is reason to believe that American farmers will take a lively interest in this competition.

All who are inclined to compete will receive a descriptive circular, as soon as it is printed, by inclosing their address with stamp.

Any other dealers, beside those who have already enlisted, are invited to co-operate in promoting this object.—CONRAD WILSON, P. O. Box No. 4242, N. Y. City.

RURAL NOTES AND QUERIES.

Free Text Books in Schools.—The State of Wisconsin has supplemented its free school system by providing free text books for all classes of scholars. This plan has several important advantages. Buying largely, the State secures the books at lower rates than individuals or schools could do. The books are preserved for successive classes of scholars, thus greatly decreasing the cost. The children of poor parents are provided as well as the children of the rich. Many poor children attend to whom the cost of buying school books would be a serious burden. All the scholars, moreover, are provided with books at the beginning of the session, and the school can "begin" the "first day," instead of having one to three weeks wasted before all the scholars have text books. It has long been the custom in normal schools in some of the States to provide books at public expense; but there is certainly much stronger reason for doing this in public schools, where the great body of the poorer people get the bulk of their education, than in those large institutions of learning whose benefits are only available to the few. With the means taken to educate their children the people of Wisconsin ought to secure that pre-eminence for intelligence which the free school system of New England did for its people in the earlier history of our country.

Protection of Cattle in Cars.—The U. S. Senate has passed a bill prohibiting the confinement of cattle, hogs or other stock in railroad cars or other vehicles for a longer period than twenty-four hours, without food and drink and a chance to rest. The owner may perform the feeding and watering himself, but if it is not done he shall be liable to a fine of not less than $100 nor more than $500. Railroad companies are made responsible for the feeding and watering of stock, and in case it is done by them, owing to the neglect of the owner, the companies shall have a lien on stock for the value of food or attention furnished. The bill is undoubtedly designed in the interests of mercy, but such a law will not execute itself without a great number of officials to see to its enforcement. It seems to us that it is a very proper subject for action by State Legislatures, in which case of course its execution would naturally devolve on police officers and local courts already in existence.

Scarcity of Clover Seed.—Clover seed has suddenly gone up in price, and farmers who have it to buy find that they must pay two or three dollars per bushel more than they expected. Clover seed has been too low several years, and the advance is a healthy indication. We hope it will not lessen the quantity sown per acre. It is better to get a good seeding wherever you attempt to seed, and if the price of clover goes too high, leave some without seeding, plow the stubble and sow with wheat in the fall. In some cases—as where land is very rich, it will pay to grow wheat after wheat. While clover seed is so dear it will not pay to try to seed after oats. There was generally a poor "filling" of clover heads last fall, and owing to the low price for two or three years, many farmers did not try to save seed. We hope they will let their clover grow the coming year and save a good crop of seed. It will pay in the improvement of the soil if not in seed sold.

Death of Judge Warner.—The Hon. H. G. WARNER of Rochester, N. Y., died suddenly, a few days ago, at Greensboro', Ga., where he was spending the winter with his family. Judge WARNER was long a resident of Rochester, and actively participated in matters tending to improvement in agriculture and horticulture. He was also greatly interested in education, being one of the Regents of the University at the time of his decease. Though possessing positive opinions, which he always maintained with ability, Judge W. had many ardent friends, and his unexpected departure from earth will be widely regretted. His remains were taken to Rochester and interred at Mt. Hope, near the fine residence he so long occupied.

A Railroad to be Completed.—The Rochester and State Line Railroad, connecting Rochester, N. Y., with the coal regions of Pennsylvania and opening some rich farming regions of Wyoming Co., N. Y., has been in financial trouble for a year or two past. The City of Rochester is bonded for $600,000 to aid the enterprise, and some of the towns on the route still more heavily in proportion to their wealth. To all these it will be gratifying news that an arrangement has been made with J. CONDIT SMITH of Buffalo by which the road will probably be finished the coming season, and ultimately the bonds on which it has been mainly built will be made good to the localities issuing them.

The Spread of Noxious Animals.—The sportsmen in the neighborhood of New York City have betaken themselves to a new device to provide themselves with game. They catch foxes in some far-off place, bring them to Staten Island and various parts of New Jersey, give the animals a fair start, and then hunt them down. The trouble is that the fox almost invariably escapes, and now the vermin have taken to breeding and are becoming altogether too plentiful for the comfort of poultry growers in the vicinity. It is thought now that no new foxes other than the natural increase will be needed for several years to come. The folly of most of the city "sportsmen's associations" has never been more glaringly shown than in this increase of foxes and by their futile attempts to destroy them.

The Centennial Appropriation—amounting to $1,500,000—has passed the Senate without amendment, and the bill has received the approval of the President. This will probably enable the Commissioners to complete their arrangements for the Centennial Exhibition in due season and without further aid from the Government. Though opposed to subsidies in most matters, we think the justice and propriety of this appropriation will be concurred in by all people throughout the country who believe in celebrating the Republic's Centennial Anniversary—a matter in which the East and West, North and South, should heartily unite.

RURAL BREVITIES.

PEACH trees are in full blossom in East Tennessee.

IT is estimated that 20,000,000 young trees have been planted on the Minnesota prairie lands for timber.

THE Kohl-rabi is held in high esteem as a substitute for turnips. It stands drouth better than Swedes.

IT is said in England that animals which have been vaccinated are exempt from the foot-and-mouth disease.

W. B. KING of Suffield, Conn., has two breeding sows that have had since Aug. 1, 1875, 57 pigs, of which he has raised 49.

HOOPES, BROTHER & THOMAS, of the Cherry Hill Nurseries, West Chester, Pa., issue a neat Semi-Annual Trade List for the Spring of 1876.

MOST of the willow used in this country is imported from Holland, where it flourishes in the damp, mucky soil of the newly-drained land.

THE Iowa Agricultural Farm of 860 acres produced 3,669 bushels of corn, 1,300 bushels of oats, 127½ tons of hay, and 27½ tons of roots last year.

FARMERS of Richland Co., Wis., have built a wooden railway 18 miles long, at a cost of $3,000 per mile. This secures them good roads to market.

B. H. STAIR & Co., Cleveland, Ohio, send us their new Catalogue of Native and Imported Field, Garden and Flower Seeds, Agricultural Implements, &c., &c.

COLE & BROTHER, Seedsmen and Importers, Pella, Iowa, send us their "Descriptive Seed Catalogue of Choice and Select Vegetables and Flowers," for 1876.

I. H. BABCOCK of Lockport, N. Y., who makes a specialty of growing Grape Vines for nursery agents and dealers, sends us his Wholesale Price List for the current season.

AS a means of encouraging high farming among small proprietors, the Prussian Ministers of Agriculture are considering a proposition to award prizes for well managed small farms.

WM. E. BOWDITCH, Seed and Plant Grower, 645 Warren St., Boston Highlands, Mass., issues a Monthly Price List of Plants, Seeds, &c., which must prove very useful to his patrons and the public.

THAT was a good idea of the Colorado breeder, who compared a sheep to the Government bond, from which the owner could annually clip his coupon (fleece), leaving the principal to gather interest for another year.

A SIMPLE remedy for neuralgia is horseradish. Grate and mix it in vinegar, the same as for table purposes, and apply to the temple when the face or head is affected, or the wrist when the pain is in the arm or shoulder.

THERE were assembled at Nashville on the 13th inst., 200 stock-breeders, who organized the Tennessee Stock-Breeding Association. Addresses were delivered by W. R. DUNCAN of Illinois and J. B. KILBREW of Tennessee.

A CORRESPONDENT recommends dried sweet corn, cracked and then moistened with molasses and properly roasted as a substitute for coffee. We would suggest roasting before the molasses is applied, else the sweet is very apt to burn.

"THE New Guide to Rose Culture, published annually by The Dingee & Conard Co. Rose Growers, West Grove, Chester Co., Pa." A very neat and useful little annual is the one thus entitled for 1876, and a good substitute for the catalogue formerly published.

THE news from England in regard to the wheat crop is not favorable. The season has been unfavorable for the seed in the ground. It is reported that much of it is rotting. Favorable weather may change appearances, but that the next crop will be a short one is highly probable.

THE Vegetable and Floral Guide for 1876, containing descriptions and directions for the culture of Over Twelve Hundred Flowers and Vegetables, just issued by the Detroit Seed Co., importers, growers, and wholesale and retail dealers in Seeds and everything for Gardening, Detroit, Mich., is a beauty in illustrations, printing, etc., and admirably arranged.

BUSINESS NOTICES.

A Universal Remedy.—"Brown's Bronchial Troches" for Coughs, Colds and Bronchial Affections, stand first in public favor and confidence; this result has been acquired by a test of many years.

THE "Phœnix brand Pure White Lead," made by Eckstein, Hills & Co., is the most economical paint you can use. Every keg warranted.

BRIDE & CO.,
769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

A WINTER SONG.

Alas! cold earth, dost thou forget
The scent of April's violet?
Do wailing winds bemoan the death
Of youth, and joy, and odorous breath?
Are all these shriveled leaves that fall
Heaped up for beauty's burial?

Ah! no, no, no; the careful year
Prepares a bed and not a bier:
Though beauty's trance be long and deep,
Her heart still quivers in her sleep.
Then leave her place of slumber bare;
Let the loved sunlight enter there.

Alas! cold heart, hast thou foregone
The bliss that o'er thy spring-time shone?
Has all the winter of thy woe
Congealed thy weeping into snow?
And in that long and bitter frost,
Has the sweet life of love been lost?

Ah! no, no, no: love wakes again,
Though still and pale it long hath lain,
And chilly was its place of rest;
Then warm it, dearest, on thy breast;
Revive it with thy voice divine,
It wakens to no touch but thine!

The Story-Teller.

THE BROKEN PRIMROSES.

A HIGHLAND LOVE STORY.

Among all the flowers that make the country beautiful, I think none have such a tender place in memory as the primrose. Who ever passed the months of spring in the country, in childhood, who cannot recall how joyously the first appearance of the favorite was hailed, and its opening watched as its delicate buds peeped from among the thick green leaves under the shade of a brier bush, or around the roots of a wide branching ash tree, or on the tiny shelves of the hoary rock?

To see even a bunch of artificial primroses on a pretty young lady's bonnet seems to me to give a touch of poetry to the wearer; while to see them worn by a matron about to enter into the sere and yellow leaf period looks like the ripe months of September or October wearing the livery of spring. They seem more in keeping even on the silvery locks of old age; for an early primrose may blossom on the brow of winter. But to our story.

The laird of a certain Highland estate, which we will call Achanellean, was early left fatherless, but was carefully trained by a very wise, although a doting mother. Sir Evan was a fine, high-spirited young man, who gave her the very highest satisfaction in all things, excepting in the wandering habits he had early formed. He would often dress himself in the strangest disguises and mingle with his tenants, taking a leading share in their games and pastimes. During his strolls he frequently gazed with delight upon such panoramas as that so beautifully delineated in "A Mountain Scene in Scotland"—a view not uncommon in the Highlands.

Sir Evan's mother, knowing his high and honorable nature, was never afraid of his doing anything wrong, at such times, but she thought his conduct undignified; so, as she could not win him from this strange habit, she tried to influence him to get married. With this object in view she gathered around her, both in London and at home, all the young ladies she most admired; but her efforts seemed in vain. Sir Evan was courteous and attentive to all her guests, but he was still fancy free; and she loved him too tenderly to wish to see him married without a sincere attachment. She knew the requirements of his nature, and understood, therefore, that a loveless marriage would only drive him further into the wandering habits from which she wished him weaned.

When Sir Evan was in his twenty-fifth year, he went to a distant part of his estate, which he had never visited before: and, hearing there was to be a wedding, he went to it in disguise as a minstrel. He wore a tattered old tartan coat, and carried his fiddle over his shoulder in a green baize bag, while his fair skin was stained to appear dark as a gipsy's.

It was towards the latter end of spring—a clear, beautiful afternoon—and by the river-side the young people were gaily dancing, while an old white-haired man, with palsied hand, was trying his best to give them music. The young man drew near, and bowing to the company, he drew his old bonnet over his brow and began to play.

The dancers were delighted, for they had never listened to such strains before; and the old fiddler, trembling for fear of losing the reward he expected, went to the young minstrel in the first pause of the music, and proposed that whatever was paid to either of them should be equally divided with the other. The young man laughingly assented, and when the best man came to offer him a glass of something to drink, he refused it; but said, as it was getting cold, if the old man would play them a spring, he would be glad to be allowed to dance a reel.

Permission was at once given, and the minstrel asked for his partner a pretty, gray-eyed, modest-looking maiden, whose graceful movements he had watched in the dance. She readily gave him her hand, and such dancing was seldom seen by those present. When he led her back to her friends, he offered her a few primroses from a small bouquet he had gathered by the river-side, and, turning to another fair girl, he offered her the remainder of the flowers, and begged her hand for the next dance. She tossed her head indignantly, and her looks said plainly, "Do you think I would dance with a gipsy?" She had taken the flowers out of his hand, but she broke them, and cast them away, saying suddenly, "I don't care for flowers, and I'm not going to dance with you, thank you."

The young man turned away hastily, and the maiden who had danced with him said to her companion, "How could you wound the young man's feelings so? What harm could it do you to dance with him? And oh! the dear primroses; the first I have seen this year; see, you have broken them;" and Ellen bowed down and gathered the scattered flowers, carefully placed them among those given herself, and fixed them in her belt.

"How could you rather dance with a fellow like that—likely one of the gang of tinkers that passed yesterday? And will you really wear the flowers he gave?" replied the maiden with a scornful sneer.

"I wear the flowers for their own sakes. How could you break them—the beauties?" replied Ellen, caressing the bouquet with a tender touch; "and as for dancing with the young man, I am sure I am quite ready to do so again, were it only for his delightful music."

Margaret drew herself away in dignified silence. She was quite horrified at the conduct of Ellen; and the young man, who was hovering near, and watching the maidens, again offered his hand to Ellen; and, anxious to heal the wound her companion had given, she danced with him gladly. He saw she was enraptured with his music, and he was delighted when, at the close of the festival, she asked him to proceed to her father's house, where she wished to hear again his sweet strains. She had an old piano—not a very good one, but nevertheless one that gave her pleasure; and she wished to try some of the tunes he had played to the dancers. Ellen's sisters were very much afraid she had compromised the family dignity by dancing with this stroller, and they grumbled about her asking him to their home so late in the evening. He went, however; and after Ellen and himself had discoursed music for a considerable length of time, to the delight of the old folks, who were rather proud of Ellen's musical taste, he rose to leave.

They offered him a bed in the barn, but he said he had to be miles away before daylight; so Ellen gave him a piece of money and stuffed his pockets with bread and beef and a large piece of cheese, at the same time begging of him if he ever came that way again to give them the pleasure of listening to his minstrelsy.

Sir Evan returned to his own castle, but he could not banish the image of the gentle Ellen from his heart. When he slept or woke he always saw her as she stood fixing the broken primroses in her belt—looking so sweet and pretty in her white dress and blue ribbons, and her rippling brown hair tossed both by the evening breeze and by the dancing; and at length when his mother renewed her attacks upon him about getting married, he told her of the maiden he had learned to love so well.

The lady was dumbfounded. Was her darling son, the pride of her heart, to wed a nameless, humble bride? But as she pondered the matter over she became more reconciled to it. If he loved this maiden his happiness was concerned, and what was his true happiness was hers. So after a short silence that almost seemed years, she raised her head and asked Sir Evan if he had cause to think the maiden returned his love?

"I dare not say she does, mother," he replied; "yet, I think she thought tenderly of the strolling musician. I think there was a sigh of regret for his not being the son of a neighboring farmer. I could read that in her dark gray eyes, even when she was not the least conscious of it herself."

"God bless you, my dear son," replied the good lady, with a tremor in her voice, "God bless you, indeed; so amiable a maiden must prove a sweet companion; and she must be in a measure accomplished, according to your statement; and if it is for your happiness, I am reconciled."

The young man kissed his mother's hand with tenderness and gratitude; and he went at once to order out his carriage for the interesting journey. He dressed with great care, and a finer-looking man could seldom be seen.

His well-knit limbs were lithe and hardy-looking, and showed the nimble huntsman or the brave soldier, as occasion might demand. His dark hazel eye was beautiful, and his curling hair the very sunniest shade of brown. His bushy whiskers were auburn, and the habit of command gave a dignity to his presence that lightened the charm of the whole.

Ellen's father saw the carriage approach his house in great surprise, for he knew the great yellow carriage, though he had not seen it for years. He went, bonnet in hand, to meet the laird, while his good wife hastily got on her best cap, and looked to her whisky bottle and her bread and cheese, in case he might alight to rest his horse and get some refreshments, as she had seen his excellent father do.

Sir Evan leaped from the carriage, and gaily entered the old house as if he had been an acquaintance for years, to the great delight of the good farmer and his wife. He partook of a glass of rich cream and a piece of delicious oatcake, and then asked to see their family. They came one by one, tall, blushing girls, and stout, healthy-looking, awkward lads—all but Ellen; and Sir Evan asked if these were all.

"We have one other daughter, our second eldest, but she is busy with some household duties, and unfit to come into your presence; so we hope you will excuse her, Sir Evan," said the mother gravely.

"Show me where to find her then, and I will go to her," said Sir Evan, with a strange quiver of lip and voice.

The mother was about to call the daughter, when one of the boys, hastily opening the door, pointed to the room where Ellen was busily taking off the butter from the churn. She was arrayed in a plain gray linen dress, clean and neat, and the curls, that had hung so prettily about her neck and face at the wedding, were fastened back with a piece of bright blue ribbon; but the drooping, tall, lily-like figure and the modest gray eyes were the same, and the expression he thought so angelic when she gathered the broken primroses was still the same also; indeed, as he gazed upon her, he thought her more beautiful than ever. She looked bewildered at the fair face of the young man, and he took her hand, saying:—"I have accepted your invitation, Ellen. You see I have returned, though in good sooth your eyes would speak a warmer welcome if I had come with my tattered coat and my fiddle."

A MOUNTAIN SCENE IN SCOTLAND.

Ellen stood speechless in astonishment; for she saw, indeed, he was no other than the strolling musician—for that hazel eye had left a tender regret in Ellen's heart for which she had often chid herself; and as it flashed across her mind who he was, and how she had stuffed his pockets with bread and beef, she fell on her knees, crying:—"Forgive me, sir; oh, forgive me. I knew not, indeed, you were any other than what you seemed."

"Forgive you, Ellen! Yes, my fair girl; you have more need of forgiveness than you think, for you have stolen my peace of mind away. Will you restore it to me? Will you be my partner now again—for all my life long?" He raised her from the floor as he spoke and drew her tenderly toward him; and she laid her face upon his bosom and wept tears of the purest joy and gladness as, amidst his caresses, she promised to be his through life. Ere he led her back to get a blessing from her parents, he took from his bosom a bouquet of the latest primroses of the year and fixed them on her breast, whispering:—"These flowers must always be sacred to us; for it was when you were gathering those of mine, so rudely broken and scattered by an ungentle hand, that my soul went out to you in the fulness of its first affection."

So Ellen became the wife of Sir Evan, and through life proved herself a true wife, a loving mother, and a benefactress to the poor and lowly. Sir Evan's mother never had cause to regret having given her sanction to the marriage; for she became very proud of her lovely daughter-in-law, whose charming character was daily astonishing her more and more. They are old now, and the elder lady has passed away; and the young generation are grown up to manly sons and beautiful daughters, being loved and wooed and won in their turn; but none of them are happier with their lovers than Ellen is with Sir Evan; and in the spring he never appears before her on any morning without a bouquet of primroses, which she places in her belt as she had done long ago to those he had first given her. The family all know the story; and they have heard how chagrined the haughty Margaret was when she learned who she had refused to dance with at the wedding by the river side, and whose flowers she had broken so rudely and cast to the winds; and the most valued painting in the castle is the fair Ellen in her white dress and blue ribbons, and sunny, rippling, golden-brown hair, with a tender look, half-glad, half-regretful, gathering into her bouquet the broken primroses, and a hazel-eyed, handsome gipsy gazing at her with passionate admiration.

A SUCCESSFUL MERCHANT.

Fifty years ago or more, says the New York Sun, a lad named Augustus Hemenway was engaged as a shop boy in a dry goods store in Charlestown, Mass. His extraordinary aptitude for business attracted the notice of a Boston merchant, who was heavily engaged in South American trade. He took the boy to his counting house on Central Wharf, Boston, and when the latter grew up to manhood sent him to Valparaiso to look after his large interest in that city. In a short time the young man left his employer and struck out for himself. This South American trade was a comprehensive one. It embraced the buying of all kinds of South American products, hides, wool, copper, etc., sending them to the United States, and bringing back an assortment of American manufactures. The business established by Hemenway advanced with great strides. The wealthy English houses in Valparaiso, having confidence in the remarkable ability of the young American, lent him their credit. A singular feature in this man's career was that he never gave a note. His business in a few years had become so great that he found it necessary to return to Boston and establish a house in that city. He sent his brother, Charles P. Hemenway, to South America to manage the house there, and, remaining himself in Boston, enlarging his operations until the magnitude of them demanded every moment of his time. He even built his own ships, and made additional profits by carrying his own goods. He owned sugar plantations in Cuba, copper mines in South America, and had business relations with the Barings of such magnitude as to astonish even that colossal house, and the whole of this immense business he managed himself.

Now comes a strange change in his career. About fifteen years ago, one morning he walked into the China Insurance Company's office, and expressed some anxiety about a payment which he was obliged to make of a comparatively trifling amount, saying that he was afraid he should not be able to meet it. Mr. Bacon, the President of the company, was astonished, and after some talk with Mr. Hemenway, was convinced that the latter was a little out of his mind. Mr. Hemenway himself came to the same conclusion. He sent for his lawyer, and ordered him to draw up a power of attorney confiding the management of his business to his brother Francis, and Mr. Tileston, his brother-in-law, of the firm of Spofford & Tileston. Associated with them was his chief clerk, a Mr. Brown, also a man of great business sagacity. Having done this, he quietly retired to Litchfield, Conn., and put himself in charge of an eminent medical man who resides there. In his house he remained for thirteen years, watching and nursing his brain. He had satisfied himself that without perfect rest and quiet the machine so terribly tried would give out, and the result would be softening of the brain. He passed his time in quiet amusement, glanced at the newspapers, but would never allow the word business to be mentioned in his presence. During this long period of seclusion, the great civil war broke out and was extinguished, specie disappeared, a new currency was born, new channels of trade were opened, and new methods of business were evolved. The great whirlwind swept by him unnoticed. To his friends Hemenway appeared to be hopelessly insane.

About eighteen months ago, like a clap of thunder from a clear sky, a telegram came to Charles Hemenway, worded thus: "Bring on your trial balance—Augustus Hemenway." The brother telegraphed to the physician. The answer came: "Patient perfectly recovered." Mr. Hemenway received his brother and the trial balance and looked over it. A few days afterward he walked into his counting room on Lewis's wharf, hung up his hat on the accustomed peg and sat down to business quietly. In a few days more he looked over the entire transactions of the house for the past thirteen years, and generally approved of what had been done.

Mr. Hemenway resumed the charge of his business. It had been enormously enlarged by his brother and Mr. Brown. To them he released the entire profits of the thirteen years. Now this extraordinary man has resumed his sometime suspended business. He is now engaged in some operation, which will, no doubt, prove successful, as it is asserted that during his long career he never made a business mistake. Mr. Hemenway is probably the wealthiest man in America. He owns a great deal of property in New York city. Seeing that the dry goods trade was drifting over to Church street, he bought some old houses there, and pulling them down, erected stores. He received as much for one year's rent as the ground and old houses cost. During the whole long self-imprisonment of this remarkable man, his wife was an angel of mercy to the poor, going about and visiting them, and spending money to the extent of a prince's revenue. All this she did in the most unostentatious manner, and as secretly as if detection would bring scorn instead of honor.

DEACON MARVIN, OF LYME.

One of the early settlers of Lyme was Reynold Marvin. He was a rich land-holder, a militia captain and a deacon of the church. He professed to be governed by Divine communications. On one occasion he announced that the Lord had directed him to distribute his cows among the poor. A shiftless fellow who was omitted in the distribution finally went to the deacon, and said he, too, had received a communication from the Lord, who had sent him there for a cow.

"Of course, then, you must have a cow," was the reply. "But what sort of a cow did the Lord say I must give you—a new milch or a farrow?"

"A new milch cow, sir."

"Indeed! Your communication could not have been from the Lord, for I have no new milch cow."

The baffled beggar departed.

Another time the deacon opposed some church measure, which was carried in spite of him. He promptly refused to pay his church taxes, and was sued, and his saddle taken for the debt. He esteemed himself deeply wronged, and rode upon a sheep skin (wheeled vehicles had as yet hardly appeared in the colonies) forever afterward. And riding upon his sheep-skin one day he reigned his horse up to the cottage door of pretty Betty Lee. It was an old Dutch door, cut in two in the middle. She came and leaned upon the lower half, her blue eyes opened wide, and her dainty hands holding fast to a plate she was wiping.

"Betty," said he solemnly, "the Lord has sent me here to marry you."

"The Lord's will be done," she replied.

The deacon nudged his horse and trotted slowly away, and the maiden finished washing her dishes. Betty's father was not friendly to the deacon, and tried to break up the engagement. He did not succeed, as appears from the "publishment," which, according to the custom of the times, was posted upon the church door. It was the production of the prospective bridegroom and ran thus:

"Reynold Marvin and Betty Lee
Do intend to marry;
And though her dad op-pos-ed be,
They can no longer tarry."

They were married and lived in peace, and a small stone house on the west side of "The Street" brought up a large family of children, and in due course of events were gathered to their fathers. On a time-worn headstone in the Lyme cemetery may be seen the following inscription:

"This Deacon, aged sixty-eight
Is freed on Earth from carving,
May for a crown no longer wait,
Lyme's Captain Reynold Marvin."

A Day's Pleasure.—By William D. Howells. Illustrated. Osgood & Co.

Enoch Arden.—By Alfred Tennyson. Illustrated. Osgood & Co.

The enterprising Boston publishers, whose imprint they bear, are entitled to the thanks of the lovers of choice literature for the admirable taste displayed, and convenience afforded, in issuing these beautiful miniature volumes. They belong to the "Vest Pocket Series of Standard and Popular Authors," and are fully as attractive, in both contents and style, as those of the same series we have previously noticed. "Their Lilliputian size, legible type, and flexible cloth binding, adapt them admirably for the beguiling (or improving) of short journeys; and the high excellence of their contents makes them desirable always and everywhere." They are sold at a uniform price of fifty cents each.

Christmas Stories.—By Chas. Dickens. With Original Illustrations by E. A. Abbey. New York: Harper & Brothers.

The admirers of Dickens' writings, and the thousands who are to become such, are under obligations to the Harpers for issuing this handsome volume. Its broad, double-column pages, clear print and fine original illustrations render the book attractive, and many who have read these Christmas Stories before will be glad to secure them in this form for re-perusal and preservation. The collection comprises fourteen stories, opening with "A Christmas Carol," followed by "The Chimes," "The Cricket on the Hearth," &c.

The Devil's Chain.—By Edward Jenkins, M. P., author of "Ginx's Baby," Etc. [16mo.—pp. 163.] New York: Harper & Brothers.

Locating his sketches in the city of London, our author delineates, from facts and statistics, the fearful loss of life, character and property from the use of intoxicating liquors. The Nine Links (or chapters) of this Devil's Chain exhibit in rude, stern, truthful outlines, the full features and proportions of the most fatal abuse or disease now afflicting mankind. We wish the work could be read and pondered upon by every well-wisher of peoples and nations among whom intemperance prevails.

A Paying Investment.—By Anna E. Dickinson. [16mo.—pp. 120.] Boston: James R. Osgood & Co.

Every lover of this Republic who peruses the little work before us will find in it abundant food for thought and reflection, and incentives to action in the right direction. It expresses ideas upon education and good citizenship as related to the future prosperity of our people and the perpetuity of republican institutions which are worthy of profound consideration by every intelligent and patriotic American.

Monfort Hall.—A Novel. By Mrs. Catherine A. Warfield, author of "The Household of Bouverie," &c., &c. [12mo.—pp. 230.] Phila.: T. B. Peterson & Bros.

The critical members of our family pronounce this a capital work, and one of them confidently adds that "Mrs. Warfield *always* writes good books." It is an American story, though an English gentleman figures as a prominent character. It is quite original and absorbingly interesting.

A Rent in a Cloud. A Novel.—By Charles Lever. [8vo.—pp. 111—paper cover.] Phila.: Petersons.

The world-wide reputation of the author will no doubt secure a wide sale for this work in the cheap form in which it appears. It is characterized by the free, dashing, manly style of Mr. Lever's most popular works.

LITERARY ITEMS.

A revised and enlarged edition of Dr. Hooker's work on Chemistry will be published by Harper & Brothers.

Charles Reade, the popular English author, is said to be meditating a visit to the Philadelphia Centennial.

Senator Logan has written a play for private exhibition. It is called "The Adventures of a Congressman."

Italy has a poet-laureate, Giovanni Patri, who is so prolific that he has just published a volume, called "Psiche," containing 568 sonnets.

The Rev. Dr. Henry M. Dexter of The Congregationalist will soon publish a monograph on "Roger Williams and his Relations to the Puritans."

Dr. Holland's novel of "Sevenoaks" has reached its twenty-fifth thousand. Its dramatization by Dr. Holland and Miss Gilder has been completed.

Beamish Murdoch, a lawer and author of some note in Nova Scotia, and the historian of that Province, died recently in the seventy-sixth year of his ago.

Mr. Caleb Cushing, U. S. Minister to Spain, has fallen into that infirmity of noble minds—he has written a poem for the birthday anniversary of a French princess, five years old.

Household art is occupying the public and publishers in England as well as in America. Two new books are announced, "The Art of Furnishing" and "Tables and Chairs."

Sheldon & Co. have removed to No. 8 Murray St., where they will hereafter confine themselves exclusively to publishing, in which they purpose to engage more largely than ever before.

The publication of Charles Sumner's works has come to a standstill, the fund left by him for completing the edition having been expended. Several volumes remain to be edited and printed.

Scribner, Armstrong & Co. will reprint the volume of Mr. W. S. Gilbert's plays, including "The Wicked World," "Pygmalion and Galatea," "The Princess," "Charity," "The Palace of Truth," and "Trial by Jury."

Hon. David A. Wells has prepared a satirical work on finance, entitled "Robinson Crusoe's Money." It tells how Crusoe and Friday went into money making and gives the sad results. The story will be profusely illustrated by Thomas Nast and will be issued by the Harpers.

The end of the dispute concerning the verity of Gen. W. T. Sherman's criticisms in his Memoirs, is not yet. Gen. Boynton having sharply reviewed the Memoirs, is now in his turn pursued by Mr. C. W. Moulton, who essays to prove that Boynton's review is warped and unfair.

Sabbath Reading.

THE VOYAGE.

ANCHORED.

O weary days and nights, so still, so still—
The useless sails hang flapping stiff and slow,
We pine and chafe, and set our helpless will
In vain revolt at what to change, to know
Is not for us. We hear the strong winds blow
And fret as in the east, the west, we see
Great ships and small go sliding fast and free.

ADRIFT.

O fearful days and nights, so dark and cold—
The swift waves mock and leap on every side;
No rudder steers; no mast nor spar can hold;
We think no ear could hear us if we cried;
We think God would not miss us if we died;
We feel forgotten, helpless, cast away;
We shut our eyes and do not even pray.

ON SHORE.

O peaceful days, and peaceful nights—whose peace
Cannot be uttered! O green shores of life
Beyond the body! Shall we ever cease
To smile that through such hot and silly strife
We cease? That doubts and fears could grow so rife?
That we could fail to see how God's good hand
Our anchorings and our driftings planned?

A BEAUTIFUL EXTRACT.

It was night. Jerusalem slept as quietly amid her hills as a child upon the breast of its mother. The noiseless sentinel stood like a statue at his post and the philosopher's lamp burned dimly in the recess of his chamber. But a moral darkness involved the nation in its unenlightened shadows. Reason shed a faint glimmering over the minds of men like the cold and insufficient shining of a distant star. The immortality of man's spiritual nature was unknown, his relation to Heaven undiscovered, and his future destiny obscured in a cloud of mystery. It was at this period that two forms of ethereal mold hovered about the land of God's chosen people. They come, sister angels, sent to earth on some embassy of love. The one of majestic stature and well-formed limb, which her drapery scarcely concealed, and her erect bearing and steady eye exhibiting the highest degree of strength and confidence. Her right arm was extended in an expressive gesture upward, where night appears to have planted her darkest pavilion; while on her left inclines her delicate companion, in form and countenance the contrast of the other. She was drooping like a flower moistened by refreshing dew, and her bright and troubled eyes scanned them with ardent but varying glances. Suddenly a light like the sun flashed out from the heavens, and Faith and Hope hailed with exciting song the ascending star of Bethlehem. Years rolled away, and a stranger was seen in Jerusalem. He was a weak, unassuming man, whose happiness seemed to consist in acts of benevolence to the human race. There were deep traces of sorrow in his countenance, though no one knew why he grieved, for he lived in the practice of every virtue, and was loved by all the good and wise.

By-and-by it was rumored that the stranger worked miracles, that the blind saw, the dumb spake, the dead arose, the ocean moderated its chafing tide, the very thunder articulated. He was the son of God. Envy assailed him to death.

Thickly guarded he slowly ascended the hill of Calvary. A heavy cross bent him to the earth; but Faith leaned on his arm and Hope, dipping her pinions in his blood, mounted to the skies.

GOLDEN THOUGHTS.

Doing good is a sure way of getting good.

Let another's shipwreck be your sea-mark.

Where the heart is inclined there also will the feet turn.

There is no to-morrow that cannot be converted into to-day.

No man is so insignificant as to be sure that his example can do no harm.

Men may judge us by the success of our efforts; God looks at the efforts themselves.

It was George Herbert who said a handful of good life is worth a bushel of learning.

Religion is a little like ether in one respect—it evaporates unless you look after it carefully.

The door between us and heaven cannot be opened if that between us and our fellow men is shut.

Some change their sins as they do their clothes, and so wait upon their infernal master in a new livery.

As sharp and nipping winters do to the earth, so do afflictions to the heart—they mellow it, make it fruitful.

Value the friendship of him who stands by you in the storm; swarms of insects will surround you in the sunshine.

Kindness is the music of good will to men, and on the harp the smallest finger may play heaven's sweetest tunes on earth.

I like to go all round a text to see what's after and before; then I often find it is like a little diamond set in pearls.—*Moody.*

It is never too late with us so long as we are still aware of our faults and bear them impatiently, and so long as aspirations eager for conquest stir within us.

All truths, unless productive of holiness and love, are of no avail. They may float upon the surface of the understanding, but this is to no purpose unless they transform the heart.

Ladies' Portfolio.

OVER THE WAY.

BY PORT U. LACCA.

Over the way I hear a voice.
'Tis the gentle voice of song,
I stop to list its melody
As I pass my way along.

Over the way are beautiful eyes
That own a blissful charm;
Should I happen to pass that way—
And I may—what's the harm?

Over the way is a form that's fair,
And a heart that's good and true;
I love that voice—its charms are rare—
I love those eyes of blue.

Over the way—how familiar grown!
Two forms there are, and one more!
What can compare with papa's own
A-creeping on the floor?

OUT-DOOR HOME DECORATIONS.

In this age of artistic novelties the desire seems to be to arrange something that our neighbors have not—to improve our homes and make them attractive—to rise superior to the necessity that forbids our indulging in expensive decorations, and to convert the useless appendages of kitchen, pantry and garret into articles of beauty and usefulness. It is true that there are no cast-off articles that need be thrown away. Glue, wire, twine, the various wood mosses, burrs, shells, vegetable seeds, aniline dyes and varnish, will make them serviceable and "things of beauty." I recently saw an old, three-legged, cracked, round-bottom, iron pot—such as used to be suspended from a crane or tramel in the deep, old-fashioned fire-places for cooking—suspended from the apex of three stout rustic sticks and nicely filled with scarlet geranium, heliotrope, candytuft, and the sides almost covered with smilax, Joseph's-coat and our irrepressible Money-wort. For the fuel and coals beneath the pot grew a fine Morocco plant, scarlet verbenas, white daisies and pansies. Altogether it was quite a unique affair.

"It is a pity you cannot have it during the winter," I remarked. "Oh, I intend to. The fire there beneath the pot is held in abeyance by cups, and the pot can sit on our rustic stand nicely." At all points necessary to produce effect were suspended various and oddly-shaped hanging baskets, improving the appearance of the yard and economizing space wonderfully—for it was in a town where land was sold by the foot, and at fabulous prices, and formerly had afforded only the money-eyed portion the means of cultivating their taste or increasing their enjoyment by flowers and plants.

"It must cost considerable for such a variety of hanging baskets."

"On the contrary the cost did not exceed thirty cents, and I think I could have reduced it still less. That one you pronounced odd is a cast-off tin lamp shade, the sides made to rise or fall on a wire. I punched holes in each alternate leaf or wing, allowing every alternate leaf to drop, filled it with moss that will flourish in a very damp soil, filled it with beech mold and planted our gill—seen over the ground—the first of May. You see the result. The one there which you admired so much, is constructed of old hoop-skirt wires. I heated and let them cool several times until they became very pliable, then fashioned them over a three-pint basin. The beautiful vines are our garden pusley and wild bean. I think that one has received more compliments than either. The next one is a wooden box artistically covered with grape clippings; the vine, morning glories. I shall cut them down as soon as they have done blossoming and plant fresh seeds for winter decoration. All the others, including those side hanging pots, are tin fruit cans. Those side hangers: I melted the can lengthwise, opened it sufficient to puncture two holes to suspend it by, and now that we can see only the rich, dark green German ivy and oxalis, what matter it if the receptacle is ordinary? Those hanging from the elm there are worn out tin basins of various sizes that I punched holes in for the cords and pressed them into service. That huge boulder that the woodbine covers so nicely was the stones I picked from the yard, and threw them in that heap to be removed. I was in the woods soon after and saw a woodbine trailing over a similar heap. So I utilized my refuse heap.

"My stump there is my pet ornament. Please examine it. First, there are three pieces of cedar driven into the ground to represent the branching of the tree from the bole. Then a nail cask fastened upon them securely and filled with rich earth, and Portulaccas planted. Then the sides I covered with elm bark that I picked from my stove wood. The plants that are growing from the sides issue from the holes I bored in the cask and the places I cut in the bark. My Royal Stand, that is my special attraction, is constructed of a cheese box and the hub of a wheel. The center of the box contains a smaller box, and that and the outside space is filled with rich mold. The center box is planted with Nasturtiums and they are nobly covering that cross and circle. The space is filled with pansies, white candytuft, daisies, amaranths, and see how nicely they hide their mansion. Was ever any arrangement more unique than the hub and spokes? How orderly that thunbergia creeps along each spoke. I imagined its little yellow eye winked in recognition of my satisfied look. My tall plants would overshadow the low ones, so I economized my ground by elevating the started ones in various shaped boxes, still my friends think I have quite a novel collection, and the satisfaction I extract from their growth and blossoms is a sure antidote to discontent, dissatisfaction and any counteracting feeling that mars home enjoyment.

"Equal with my flowers is my Aviary. I heard about bird boxes; so after considerable practice, disaster and triumph, I succeeded in constructing a house that I fastened into the tree for the birds. It was interesting to watch their movements. One came, lighted on a remote branch, peered stealthily, chirped softly, hopped a little further, and so repeated these movements till he ventured to put his head within it. After halting a moment he cautiously entered, remained a moment, came out and flew away. In a short time I heard a great chattering. The pioneer bird had returned with several more; one, more officious than the others, proved to be the mate. After chattering, flying about, taking cautious peeps of the whole house, they flew to the second house that I had put up, and after similar negotiations, examinations and fluttering, the second couple took possession of their house. In less than a fortnight my ten bird tenements were taken, and I quite intoxicated by my interest in them and the amusement and instruction I gained. Since these home innovations friends have complained of my secluding myself, and one plainly told me that since my inherited money afforded me home decorations I had become proud and selfish."

"Inherited money!" I repeated, surprised.

"Yes, of course: how could you have beautified your home if you had not received a fortune from some one?"

I laughed so heartily that it was some minutes before I could undeceive her. Then the surprised look and apology reinstated our friendliness and afforded a pleasant reminiscence that we both enjoyed referring to. It is not money that always answers our desires or develops our capacity, because oftentimes so small a part of our mind becomes interested in producing. But when our taste and ingenuity are developed, and exercised in a way that brings us in actual contact with philosophy, how generous and noble become our lives! The asperity of our nature becomes toned, purified, elevated, and the occurrences and transactions that hitherto annoyed and irritated us lose their influence, and we smile complacently at the thought that they once disturbed us. Hence the good that results from owning a bit of yard and four shade trees, and being the possessor of cast-off convertible refuse.

"But how are you to keep them through the winter? Neither window in your sitting room can be spared, without making it really unpleasant by shutting out the fine view you have from both windows?"

"I asked myself the same question a year ago, and I will tell you all about it if the Editor is willing." M. E. J.

THE SISTER.

No household is complete without a sister. She gives the finish to the family. A sister's love, a sister's influence—what can be more hallowed! A sister's watchful care—can anything be more tender? A sister's kindness—does the world show us anything more pure? Who would live without a sister? A sister that is a sister in fidelity, in purity, in love, is a sort of guardian angel in the home circle. Her presence condemns vice. She is the quickener of good resolutions, the sunshine in the pathway of home. To every brother she is a light and life. Her heart is the treasure house of confidence. In her he finds a fast friend; a charitable, forgiving, tender though often severe friend. In her he finds a ready companion. Her sympathy is as open as day, and sweet as the fragrance of flowers. We pity the brother who has no sister, no sister's love; we feel sorry for the home which is not enlivened by a sister's presence. A sister's office is a noble and gentle one. It is her's to persuade to virtue, to win to wisdom's ways; gently to lead where duty calls; to guard the citadel of home with sleepless vigilance of virtue; to gather graces and strew flowers around the home altar. To be a sister is to hold a sweet place in the heart of home. It is to minister in a holy office.

LADIES BOOTS.

A writer in the Pall Mall Gazette concludes an excellent article upon "woman and her boots" as follows: Her boots are far too thin for walking purposes, and it was only last week that an inquest was held on the body of a young lady who, owing to a nail piercing the sole of her boot, received such an injury to the foot that she died of lockjaw. Woman, moreover, now that she takes so active a part in the business of life, and is almost ubiquitous, requires to be strongly if not ponderously shod, so that, when necessity arises, she may hold her own with man, returning kick for kick with that fascinating but foolish creature. A few words from the pulpit would perhaps induce her to take the question of boot reform into her serious consideration.

Every kindly word and feeling, every good deed and thought, every noble action and impulse, is like the ark-sent dove, and returns from the troubled waters of life bearing a green olive branch to the soul.

Many do with opportunities as children do at the sea shore—fill their little hands with sand, and then let the grains fall through their fingers till they are gone.

Most men take conviction from an adversary as children do physic, with a struggle and a shudder.

Reading for the Young.

A VALENTINE.

Oh! little loveliest lady mine,
What shall I send for your Valentine?
Summer and flowers are far away;
Gloomy old Winter is king to-day:
Buds will not blow, and sun will not shine.
What shall I do for a Valentine?

Prithee, St. Valentine, tell me here,
Why do you come at this time o' year?
Plenty of days when lilies are white,
Plenty of days when sunbeams are bright.
But now, when everything's dark and drear,
Why do you come, St. Valentine dear?

I've searched the gardens all thro' and thro'
For a bud to tell of my love so true.
But buds were asleep, and blossoms were dead.
And the falling snow came down on my head.
So, little loveliest lady mine,
Here is my heart for your Valentine.

[*L. E. R., in St. Nicholas.*

TWO SCHOOL-BOYS:

Their Parents, Homes and Privileges.

BY AUNT JAY.

Henry Lee and George Wood were schoolmates. They attended the same school, shared the same seat, and were in the same class. Strangers visiting would say they were the two brightest boys in the school. They were both favorites among the boys of their age—one for his kindness, and being always ready and willing to lend assistance; the other for the wealth of his father, who never failed to keep his only son supplied with pocket money, which was spent for apples, nuts, candy, etc., and distributed among his mates. How many little boys wished *they* had just such a father who would gratify every wish; but I beg my young friends to first follow the life and career of these two school-boys, and having caught a glimpse of them in the future years, then choose for themselves in whose place they would wish to be—in that of Henry, the son of a poor carpenter, or of George, the son of a rich merchant. Could Mr. Wood have been able to look into the invisible Future and see the life his wayward son was to lead, I fear his gray hairs would have been brought in sorrow to the grave years before they were.

The mother of George was one of the many women of our land who are governed by fashion and the praise of the world. Leaving her son during his infant days to the care of servants, she spent her time among the pleasures and vanities of the fashionable society in which she reigned a belle, and suffered herself to be praised and flattered for her great beauty as well as her wealth—never deeming it necessary that she should spend at least a small share of her time with the prattling babe who was starving for a mother's care. Mrs. Wood had married her husband only for his wealth; and being a very vain and proud girl in her younger days, whose beauty alone attracted the attention of numerous admirers, had rejected one whom she loved for another who was more blessed with worldly possessions.

The father of Henry Lee was not a *poor* man, but was a carpenter by trade, who supported his family by the sweat of his brow. As both father and mother wished to give to their only son a good practical education, such as would fit him for any station in life, they could spare Henry but little spending money for "nicknacks." Mr. Lee was looked up to as an honest man, always doing the fair thing in a bargain, and as such ever respected by all who employed him. Mrs. Lee—unlike Mrs. Wood—was an economical woman and truly a helpmeet to her husband, devoting the little time she could spare from her household duties to directing the education of Henry, whom she wished to grow up as an honest and God-fearing man.

As I have introduced my readers to the parents of Henry and George, we will leave them for the present and return to the boys.

During the latter part of the summer term there was a great deal of excitement prevailing among the boys attending the Academy. For a prize had been offered consisting of a free scholarship for entering College to the one that would pass the best examination and compose the best Latin composition, of which every word of the latter was to be spelled and written correctly. The prize was offered only to the members of the advanced class, in which both Henry and George belonged. Both were of equal standing in his class, for George learned very easily and therefore kept up with Henry, who, by paying close attention to his studies at home as well as in school, managed to keep at the head of his class,—while George, being a rich man's son, passed his evenings on the street and smoking cigars. His father, too much engrossed in his mercantile business, and his mother devoting her time to her fashionable friends, had no time to look after their son, who was now, at so early an age, learning to walk in the broad road that leadeth only to destruction, and alas! where so many of the most promising youths of our land find an early grave.

Henry was blest with one of the best of mothers, who took pains to make home pleasant and attractive for both father and son,—so that they had no desire to spend the evenings on the streets, but enjoyed themselves in each other's company as they formed a happy family circle around the hearthstone, where Henry every evening pored over his school books. In like manner do we find him occupied the evening preceding Examination day. He is reading his composition aloud to his parents for their approval, and we, after spending a few moments in pleasant chat with our friends, bid them good night—promising however to be in readiness the following day to witness the examination.

The bell rang calling school to order. A looker-on could hardly have told which was the best behaved among all those boys as each passed in quietly and took his seat, without a murmur. After the devotional exercises were over and roll called, visitors were announced and the committee who were to examine the classes and distribute the prizes, took chairs arranged in a row on the platform facing the school. The classes all passed a satisfactory examination—a number of each bearing a prize they had earned. The Advanced class—being reserved to the last—at the tapping of the bell now rose and took places before the judges. How excited grew their faces as the examination proceeded, each wondering if *he* would be the favored one. But only two of the whole class stood the test—George Wood and Henry Lee. The prize was not awarded then, but put off until after the reading of the Essays, which were to be read in the afternoon. After they were read and carefully examined by the committee they agreed that the prize belonged to Henry Lee, not only for being the best composed, but the neatest written, without a blot or a misspelled word. It would have puzzled the committee which of the two boys, Henry or George, should have the prize, had not George, who had neglected to copy his essay till the last minute, omitted to notice the misspelled words.

A VERY SINGULAR SENTENCE.

An exchange contains the following literary curiosity:

"*Sator arepo tenet opera rotas.*"

1. This spells backward and forward all the same.

2. Then taking all the first letters of each word spells the first word.

3. Then all the second letters of each word spells the second word.

4. Then all the third, and so on through the fourth and fifth.

5. Then commencing with the last letter of each word spells the last word.

6. Then the next to the last of each word, and so on through.

A MAGIC SQUARE OF LETTERS.

We find the following in an old Scrap-Book. It seems to have gone out of print, and we start it again:

T I M E.
I T E M.
M E T I.
E M I T.

This word, Time, is the only word in the English language which can be thus arranged, and the different transpositions thereof are all at the same time Latin words. These words in English as well as in Latin, may be read either upward or downward. The English words *time*, *item*, *meti*, and *emit* (to send forth) are mentioned above; and of the Latin one, (1), Time, signifies fear thou; (2), Item—likewise; (3), Meti—to be measured; (4), Emit—he buys.

The Puzzler.

ILLUSTRATED REBUS.—No. 6.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

A QUESTIONABLE PROCEEDING.

On Friday, Feb. 11, Owen Lindsay was hanged in Syracuse for the murder of Francis Colvin. Lindsay was first convicted a year ago and sentenced to death March 25, 1875, but various delays postponed the execution nearly a year. The remarkable fact about the doomed man was, that he uniformly protested his innocence of the crime. This denial he repeated in the most solemn manner just before the drop fell, and it constituted his dying words. Many who heard him were fully impressed with the belief of his innocence, but there was then no alternative. The testimony against Lindsay seems to have been not at all conclusive, and was mainly that of a man who was without doubt himself a participant in, if not the chief actor in the deed of blood. There seems to have been some doubt whether Lindsay was guilty. His chief accuser may have perjured himself, and if so the execution was a judicial and legalized murder. The last words of Lindsay will greatly strengthen this impression. Altogether the execution of a murderer under such circumstances is a bad job, weakening rather than strengthening regard for law. It is bad enough, and very common, to allow undoubted murderers and other criminals to escape punishment; but it is not often now-a-days that we have an illustration showing how much worse it is to hang a man who may very possibly be entirely innocent. Popular belief in the injustice of law is sure to bring it into contempt more speedily than any thing else.

HOME NEWS PARAGRAPHS.

The prisoners confined in the Oswego, N. Y., jail have addressed a written complaint to Judge O. J. Harmon, chairman of the local committee of the Prison Association. They compare the jail to Libby prison.

A ball was recently given by the Volunteer Fire Brigade of Coventry, and at three in the morning, while the dancing was in full progress, the gas was turned off, and the entreaties of the firemen could not persuade the authorities to turn it on. The result is that to-day Coventry is without any Fire Department.

It is now said that the negroes who have been emigrating in large squads from Georgia into Mississippi are anxious to return, wages not being as good as was expected and the country proving unhealthy.

The mansion at the corner of Broad and Master Sts., in Philadelphia, formerly the residence of the late Edwin Forrest, has been purchased by Theodore Thomas, and, with the adjoining grounds will be fitted up as a Summer concert garden.

A large delegation of prominent citizens of Louisville, Ky., left for Washington, Feb. 16th, to procure, if possible, the selection of Louisville as the place for the next Democratic National Convention.

Very rich discoveries of telluride and free gold ores were made on Feb. 16, within five miles of Colorado Springs, Col., assaying $243 gold and silver per ton. The veins are true fissures of great width.

Two hundred feet of the toll-bridge at Wiscasset, Me., were carried away on the night of Feb. 15 by a schooner driven by the gale.

On Sunday evening, Feb. 13, a destructive wind storm passed over Washington County, Indiana. As far as heard from six barns were unroofed and seven dwellings and numerous outbuildings were demolished. The wife and two children of Thomas Nicholson, a farmer, were seriously injured by the overturning of their house. Joel Denney lost nearly two thousand fruit trees. Some of the farmers suffered great loses in live stock. The value of the property destroyed is very heavy.

The Constitutional Convention of Colorado has voted to require the submission of Woman Suffrage to popular vote as soon as the State is admitted.

Whenever a case of yellow fever occurs in New Orleans the streets surrounding the square are sprinkled with Calvert's No. 5 carbolic acid diluted in fifty parts of water. A large sprinkler on wheels is used for the roadways and sidewalks are sprinkled by hand. The grounds of neighboring yards are similarly treated, and the privy vaults disinfected with a solution of zinc-iron chloride. At the termination of the case by death or removal, the infected apartments are fumigated with sulphurous acid or chlorine. The extent of the ground disinfected is according to the lapse of time since the appearance of the fever. The extent of the infection along the ground is forty or fifty feet daily, so that after some days' delay the whole square must be enclosed with a disinfecting band and the enclosed surface sprinkled.

According to the ninth semi-annual report of the Massachusetts Catholic Total Abstinence Union, just issued, there are now 74 societies, with 5,820 members in the State.

The warden of the Oregon penitentiary has discharged the prison doctor and detailed one of the convicts, who is an educated physician, to perform the duties. The warden claims that he saved the State $1,500 a year by this arrangement and is always sure to have medical attendance "within reach" when needed.

The long pending contest for a seat in the Virginia Senate, of Knight against Johnson, has been settled, the Senate adopting, 21 to 19, the report of the committee, giving the seat to the sitting member, Gen. Bradley T. Johnson.

The North Carolina Conference of the Methodist Protesant Church has refused to concur in the proposed convention for a union between the Methodist, Protestant and the Methodist (non-Episcopal) churches which were separated by the war.

Pearce Kent, a farmer living near Ellision Ky., helped an Ohio Sheriff make an arrest in Ky. the other day. His neighbors considered Kent a traitor to his State, and mobbed him, pounding him so with ax-helves and pokers that he nearly died. Kent is 70 years old.

Alice Young, a grand daughter of Brigham Young, has scandalized Mormon Society by marrying Chas. H. Hopkins, who happens to be a Gentile. Brigham was very much enraged, but like other parents with similar troubles is unable to do anything about it.

A little Meriden (Ct.) girl whose father recently died, being displeased that her mother has fallen in love with another man, applied to the Mayor the other day to have the affair stopped by the police, and when informed that they couldn't do anything about it, left his office crying.

A fire started on the evening of Feb. 16th in the Bates House in Rutland Va., and before it was extinguished caused a loss estimated at $100,000. The Bates House was destroyed, and the office of the Rutland Herald badly damaged. The following firms were also burned out:—A. C. Bates & Son, hardware: G. W. Hillard, dry goods; C. S. Mason, clothing; A. W. Higgins, drugs; Abraham & Brothers, cigars; John Haley, saloon; A. O. Cunningham, clothing. The insurances, so for as ascertained, are:—Bates House, $40,000, and $18,000 on the furniture; George W. Hillard, $6,000; Charles S. Mason, 5,500; A. O. Cunningham, $4,000 A. L. Bates & Son, $7,000; A. W. Higgins, $11,500; Tuttle & Co., $10,000.

A. C. Russell, aged sixty-seven years, a leading citizen of Great Barrington, Mass., dropped dead in the street there on the 16th, of heart disease. He was connected with the Monument Mills of Housatonic, director of the Berkshire Life Insurance Company and President of the Berkshire Woolen Company.

The bill to abolish the death penalty in Maine and substitute imprisonment and hard labor has passed the Senate by a vote of 18 to 11. The measure had previously passed the House. An attempt to have the question settled by the people at the next election was defeated in the Senate by a vote of 18 to 12. The opponents of hanging are greatly rejoiced.

A dispatch to San Francisco, Cal., dated Feb. 18th from Tucson, Arizona, states that a battle took place on Jan. 14 between the Sonora revolutionists and the State troops near Almos, in which the latter were routed. Pursuit resulted in another fight—both sides being reinforced—and another victory for the revolutionists ensued. The latter have 500 cavalry concentrated near Conleari.

A fire in the round-house of the Lake Superior and Northern Pacific Railroad at Rice Point near Duluth, Feb. 18th, destroyed one wing of the building and badly damaged four locomotives. The total loss is between $20,000 and $25,000.

The New York, New Haven and Hartford Railroad will run through trains from Boston to Philadelphia during the Centennial show in eleven hours. Trains are to run down the Portchester branch road to the Harlem river at Mott Haven, and thence they are to be put on board the steamboat Maryland, which is being refitted to receive an entire train of cars. The barge by the way of the East river will connect with the Pennsylvania Central Railroad at Jersey City.

It is suggested that the burning of kerosene is one cause of the great prevalence of diphtheria of late years.

The New England sleighmakers have given up the present winter as a bad job and gone to making buggies.

James Parton has remarried his wife, and now "all goes merry as *two* marriage bells."

Wm. B. Reed, LL. D., long a Philadelphia lawyer, and one of the ablest contributors to the periodical press, died in New York City on the 18th inst., in the 70th year of his age. He was author of the "Life and Correspondence" of his illustrious grandfather, Joseph Reed, of Revolutionary fame, and during his life occupied various positions of honor and trust.

Miss Charlotte Cushman, the celebrated actress, died at the Parker House in Boston, on the 18th inst., aged 60 years. Though long enfeebled by cancer, the immediate cause of Miss Cushman's death was pneumonia, caused by taking cold during a walk on the Saturday preceding. She was not only a great actress but a model woman in society and private life, and will be widely lamented.

FOREIGN NOTES.

The Sultan proposes to give amnesty to insurgents submitting immediately.

It is proposed by the Conservatives to place M. Buffet as a candidate against M. Thiers in Paris.

L'Aigle, a Bonapartist journal, was seized in Corsica.

The Prince of Wales will visit Gibraltar on his way home from India, and it is proposed to erect there a column and bust of His Royal Highness to commemorate the event.

The Scottish Rifle Club has resolved to send a team of its own to the International match.

The Porte has declined to allow the revenue in Bosnia and Herzegovinia to be applied solely to local purposes.

Four Roman journals have been seized for publishing a speech of Garibaldi's.

The Prussian mines produce about 5,000,000,000 pounds of iron ore per year, which are worth nearly 7,000,000 thalers.

Petitions have been presented to the Prussian Parliament asking the Government to secure to the working classes their Sunday for rest.

A Canada journal has discovered a hermit in the town of Perth who is seventy years old, and for forty years has not worn any clothing summer or winter, in spite of which he has never been frozen.

The Trinity Board have had constructed in England a lighthouse of Dalbeattie granite, which is built in sixty-four courses, and is designed to be erected at Ceylon.

The Alfonzo XII., a new steamship, just built on the Clyde for the Cadiz and Havana line, is the largest steamer that carries the Spanish flag. She is 350 feet long, 38 wide, and 28 deep. Her gross tonnage is 2,915 tons.

A Vienna dispatch of Feb. 15, says:—Negotiations are making favorable progress between Count Andrassy and the Porte to secure the Bosnians and Herzegovinians who have taken refuge on Austrian territory leave to return to their homes. There are prospects of a satisfactory result.

It has just been decided to light all the waiting and luggage rooms of the principal railway stations in Paris by means of electricity. Electric lights were recently tried in the immense luggage room, or Salle des Pas Perdus, of the Great Northern station. The experiment proved successful. By working the Graham machine with three-horse power as much light is obtained as that given by a hundred gas-lamps. The electric lantern is placed at a hight of ten metres from the ground, and sheds a soft clear light over an area of 20,000 square feet. The hall situated on the opposite side of the station, where passengers are placed on arriving from Boulogne or Calais, is still larger, for it comprises an area of 30,000 square feet. Four lanterns, one in each corner, suffice to light it up as by daylight.

It is officially announced at Madrid, that the Carlists were completely defeated on the 13th by Gen. Quesada in the formidable position which they occupied at Elgueta. Don Carlos and his forces fled toward Villa Real and Zumarraga, pursued by Gen. Quesada. The latter passed the night at Vergara. Gen. Morlones has occupied the Carlist line of fortifications and entered Zumarraga.

Deeming the Porte unable to afford protection, Roumania has decided to discontinue paying tribute. This may be regarded as one of the consequences of the Herzegovina revolt, which is demonstrating the weakness of the Turkish Government and inciting disaffected subjects to make their hostility more manifest.

By opening the British Parliament in person, Queen Victoria has again formally assumed the public duties appertaining to her station. There is little noteworthy in the speech which Lord Cairns read in her name, except the announcement that the shipping laws are to be amended, and that a royal commission will be appointed to report on the duties of naval officers in regard to fugitive slaves. By promising these measures the Government breaks the force of impending attacks from the opposition.

By an explosion of fire damp in the Jabin colliery, St. Etienne, Belgium, Feb. 4, while 230 men were at work in the pit, all but 24 are supposed to have been killed. Twenty-six have been taken out, two of whom were dead. The earth fell in in immense masses.

Oxford and Cambridge are hard at work preparing for their annual boat race in March. At the latest accounts the Oxford trial crew was made up of Miller, Exeter, bow; Mercer, Corpus, 2; Marriott, Brasnenose, 3; Michison, Pembroke, 4; Bonstead, University, 5; Williams, Corpus, 6; Banks, University, 7; Edwardes Moss, Brasnenose, stroke; Stayner, St. Johns, cox. The Cambridge crew is constituted at present thus: P. W. Brancker (Jesus), bow; T. W. Lewis (Caius), L. G. Pike (Caius), C. Gurdon (Jesus), T. E. Hockin (Jesus), F. Peabody (First Trinity), G. L. Mann (First Trinity), C. D. Shafto (Jesus), stroke; G. L. Davis (Clare), cox.

The historic Haymarket Opera House, London, has been purchased by the British Government, and will be turned into a Central Post Office.

There are now more French workmen in Berlin than there were before the war.

The Swiss Federal Council has decided that the civil marriage law does not forbid marriage with a deceased wife's sister.

A Berlin dispatch to The London Standard, Feb. 16, says the Emperor William has assented to the cession of the Prussian railways to the Empire.

Jacob Bright, Radical, has been elected to Parliament from Manchester, polling 22,535 votes against 20,074 for Powel, Conservative.

A despatch from Vienna, dated Feb. 17, says the Austrian and Hungarian cabinets are reported to have agreed that the Austrian National Bank shall establish a Hungarian bank of issue, and guarantee the latter's notes and accept them the same as its own. This solves the principal difficulty in negotiating the renewal of the Austro-Hungarian compromise.

The Allgemeine Missions Zeitschrift for November gives the total number of converts from heathenism, connected with Protestant missions in 1873, as 1,537,274. These are divided as follows: German and Swiss missions, 127,414; British, 1,116,227; American, 183,571; Dutch, 87,226; French, 14,000; Scandinavian, 8,930.

Paris was supplied during four months of the year 1875 with 630,000 pounds of meat from the horse shambles, the result of the slaughter of 1,555 horses, mules, and asses.

The Maharajah of Indore has £5,000,000 stored up in his palace, and recently wished to give the Prince of Wales a present worth £50,000, but was at length cut down to £5,000.

An officer of the Imperial Prussian Foot Guards, according to a German newspaper, has received a communication from a French officer, in which thirty officers of the Foot Guards are challenged to fight an equal number of French officers, the Germans to have the choice of arms and place.

Centennial excursions to the United States are advertised throughout Europe at cheap rates.

THE SEASON, CROPS, PRICES, ETC.

Rocky Hill, Jackson Co., O., Feb. 15.—We had a very wet season here last year. Vegetation never was greater. Potatoes are so plentiful that they are worth only 10c., and they have to be fine ones at that. Corn was heavy and a great breadth planted, so we have more bushels of corn in our country than for many years before if ever as much. Wheat was the only poor crop we had; it was almost a failure, and what little we had was nearly spoiled by the wet weather. Fat cattle are worth 4@5c.; fat hogs, 7@8c.; stock hogs same. We have had the warmest and wettest winter we have ever had in the history of our State; the roads are almost impassable. Farmers are doing almost nothing on account of rain and mud. We are in the midst of a furnace region, and can on still days hear the whistles of 23 different iron furnaces. Iron is low in the extreme; many of these furnaces are stopping. This is throwing hands out of employment; consequently, times are dull and hard. We have two new railroads commencing to build. This will give some employment and will open up a new trade for our vast coal fields. Our stone coal is of a quality that makes No. 1 iron right from the mines without coaking or any other preparation. Our iron ore, stone coal and limestone are in quantities almost inexhaustible.—L. W. T.

Felts Mills, Jeff. Co., N. Y., Feb. 14.—Raining to-day. A very mild winter and little sleighing, so far. A few farmers have commenced sugaring. Dairying is the principal business here. One or two factories have their summer's make of cheese in cellars waiting for the price to advance. Many here went into raising potatoes pretty strong, last season, and are now feeding them to their stock. The mild weather has been very favorable for wintering stock, and for doing farm work generally. Winter wheat is not looking very well, and some are expressing fears for the grass crop the coming season, on account of the ground lying bare so long.—S. W. M.

Shepherdstown, Cumb. Co., Pa., Feb. 15.—Weather variable. A snowfall on the night of the 3d inst. 6 inches deep. Previous to this we had on the 1st and 2nd high wind and cold. On the morning of the 4th inst. mercury indicated 8 deg. above zero on our hill and 7 deg. below, not more than 400 yards distant; making a difference of 15 deg.!—E. H. C.

Huntington, Carroll Co., Tenn., Feb. 15.—We have had a very warm winter. No ice thick enough to put up. Plums bloomed in January and most of them killed by snow 3d of Feb. Some of the peach crop has been killed in the bud. Corn selling here at 25c. per bush.; wheat, $1.—J. C. M'C.

Manistee Co., Mich., Feb. 15.—We have been having a warm rain. The ground is nearly bare. Usually at this time of the year we have two or three feet of snow. This winter we have not had enough to cover the hubs, and but little very cold weather.—M. E. A.

River Edge, Bergen Co., N. J., Feb. 17.—Tulips and hyacinths are from one to two inches above ground. Lilac buds are ready to break—and Spiraea sorbifolia is in leaf!—E. S. C.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 19, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	54,100	Rice, bbls	1,036
Whisky	2,633	Cut meats, pkgs	14,850
Corn meal, bbls	2,314	Lard, pkgs	9,780
Corn meal, bags	4,049	Tar, bbls	—
Wheat, bush	137,900	Tobacco, hhds	1,406
Corn, bush	218,150	do. cases	3,806
Oats, bush	151,100	Butter, pkgs	19,150
Rye, bush	72	Cheese, bxs	19,147
Malt, bush	17,713	Cotton, bales	2,283
Barley, bush	3,352	Rosin	3,000
Beans, bbls	18,046	Sats, furn., bbls	879
Grass seed, bags	14,760	Dried Fruits, pkgs	245
Ashes, pkgs	130	Eggs, bbls	13,800
Beef, pkgs	3,023	Peanuts, bags	590
Wool, bales	828	Dressed Hogs	1,598
Hops, bales	2,000	Oil Cake, pkgs	3,000
Pork, bbls	4,225	Leather, sides	76,615
allow	693		

BEANS AND PEAS.—There is very little animation in beans; mediums specially dull; late arrivals hardly selling, being below the quality of stored lots. Marrows are in buyer's favor. The free exports of 1,400 bbls. include only previous sales. Pea beans and kidneys dull. Limas again marked off. Canadian peas have declined for bulk; bbls. free, nominal. Exports of peas, past week, 11,312 bush.; since Jan. 1st, 180,625 do.; same time last year, 23,375 do. Exports of beans, since Jan. 1st, 8,114 bbls.; same time last year, 2,603 do.

We quote Beans, pea, new, prime, $1.45@1.40; other, 1.15@1.25; medium, new, $1.35@1.40, fair to good, $1.15@1.30; very poor, 90@90c.; marrow, new, prime, $1.75@1.80; other, $1.45@1.65; white kidney, prime, $1.75@1.85; fair to good, $1.60@1.70; red kidney, new, prime, $1.50@1.60; fair to good, $1.30@1.45; California Lima, choice, $2.75@3.00. Peas, Canadian, bbls., new duty paid, $1.25@1.27; bulk, in bond, $1.00; green new, ₱ bush., $1.55@1.65; Southern B. E., ₱ 2 bush. bag, $3.00.

BEESWAX.—Exports since Jan. 1, 16,435 lbs.; same time last year, 7,705 do. Exporters are taking small lots of strictly choice Southern at 33c.; Western, 32@32½c.

BROOM CORN.—Supplies are chiefly of medium grades, for which prices are weak.

We quote Brush, short green, 10@11c.; hurl, green, 8½@10c.; green, medium, 5@7c.; red and red-tipped, 3@4c.

BUTTER.—The market is still deprived of the favorable surroundings that ordinarily help to stimulate trade in winter. The weather has been stormy for two days keeping away buyers, and warm enough to unsettle values, when parcels had to depend upon samplings. Buyers are so careful in making their selections that a good deal of stock is more or less condemned when tested. There are reputable marks of State that can be safely sent out upon outside or local orders; but most purchasers insist upon running the iron into most every package. That which is called choice State is subjected to the closest kind of scrutiny by parties who are compelled to pay the extreme rates demanded for extra. The sudden falling off free supplies of fancy and first-class stock has given butter a bad reputation; every one feels that we have used up the best end of the crop, and there is consequent caution exhibited by grocerymen and others who are fortunate enough to retain a steady retail trade, which calls for sound, sweet lots of State. Choice State is still firm at our late rates; under grades waver to some degree, especially as quality and appearance are against them. Fresh Western will bring 22c. for the style now arriving. Very fancy is bringing out higher rates in a small way. Holders of Western are not anxious to sell under the current figures, as there is some thought that later on an export outlet will arise, as the Canadian yield is reported scant. Rolls are firm.

State dairies entire, extra, 32@33c.; entire, good to prime, 28@31c.; fair to good, 25@28c.; firkins, selected fresh, 30@33c., good to prime, 27@29c.; fair to good, 24@27c.; half-Brkin tubs, selected, 35@38c.; good to prime, 32@35c.; fair to good, 28@32c.; poor to fair, 17@27c.; State, Welsh, tubs, fall made, 31@33c.; dairies, 25@30c.; good to prime, 25@28c.; fair to good, 23@24c.; poor to fair, 17@23c.; Pennsylvania, store packed, 16@21c.; Western, dairy tubs, selected, 25@26c.; good to prime, 22@24c.; tubs selected fresh, 24@27c.; good to prime, fresh, 23@25c.; fair to good, fresh, 18@22c.; poor to fair, fresh, 16@18c.; Western, early packed, selected, 18@20c.; Western, early packed, other, 14@18c. Roll butter, good to prime, 20@22c.; fair to good, 18@20c., common, 16@18c.

CHEESE.—Exports for the week, 13,246 boxes; this shows a lighter trade than for some little time back, but as the grades required have been fine and strictly fancy, the offerings of which are light, prices are without attention. The local demand and trade from the neighboring markets has been fairly active. Altogether, the market may be considered as showing no decided change.

New State factory, fancy, 13¾@14c.; fine, 13c.; do. good to prime, 11¾@12½c.; fair to good, 10@11½c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12½c.; good to prime, 10½@11¾c.; fair to good, 9¾@10½c. Western factory, cheddar, fine, 12@12½c.; good to prime, 11@12c.; flat fine, 12½@13c.; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c.; pineapple, 16@18c. English dairy, Connecticut, 12@13½c., do. State, 16@18c.

COTTON.—A break in the Liverpool market and reports of failures there unsettle values here, and there are quite free sellers at the reduced figures. The closing prices are: for February, 12 23-32@c.; March, 12 16-31c.; April, 13 3-32c.; May, 13 11-32c.; June, 13 9-16@13 19-32c.; July, 13 25 32@13 13-16c.; August, 13 29-32@13 15-16c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*

Strict ordinary	10¾	Middling	11¾

DOMESTIC DRIED FRUITS.—Small lots of State quartered apples have been placed at 9¾@9½c.; there is very little doing. Blackberries are lower and dull, as well as small fruits generally. Peeled peaches are more steadily held with a little better demand.

Apples—State, sliced, 10@10½c.; quarters, 9¾@9¾c.; Western quarters, 9c.; Southern sliced, 1875 crop, 10¾@10¾c. for prime. Tennessee qrs., 8¾@8¾c. Blackberries, new, 11¾@ c. Peeled peaches, good and prime Georgia, 14@16c.; do, fancy, 18c. Unpeeled peaches, new, 12@12½c. for halves, and 10¾@11c. for quarters. Plums, 20c. Raspberries, 27@28c. Cherries, 22@23c.

EGGS.—The market has been a very fluctuating one, but closes rather steady for prime fresh Western. At this date last year Western was selling at 40@45c. Stored eggs are dull, buyers insisting upon concessions when they move them, but prefer to pay full rates for the later receipts. Limed are losing too heavily for sales. We quote:

Jersey, single barrels, ₱ bbl., 19c.; State & Penn., 18@18¾c.; western, prime, 18c.; fair marks, 16¾@17¾c.; Southern and South Western, 15@17¾c.

ESSENTIAL OILS.—The leading item, oil peppermint, is extremely dull, especially for wholesale parcels. As this is also the case in the London market, quotations here are not strong.

The following sales fully represent current rates; 3 cans H. G. oil peppermint, $4; 18 do. Hall & Parshall, $4; 5 do., $4.10; 2 do. $4 20; 350 lbs. pure, in tin, $3.50; 1,200 do. sassafras, 55c.; 300 do. wintergreen, $3.12; 150 do. spearmint, $3.50; 225 do. pennyroyal, $4.

FRESH FRUITS.—Exports of apples past week, 249 bbls.; since Jan. 1st, 3,914 do.; same time last year, 7,481 do. There is a pretty fair demand for apples; buyers, however, will not take the chance of buying very roundly. There have been considerable losses in repacking. Cranberries are running out equal to the expectations of holders. Peanuts again lower.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $2@3.50; mixed, good, $2.50@2.75; other $1.50@2. Cranberries—Jersey, choice, bush. crates, full measure, $3.50@3.75; good to prime, $3.25@3.50; made bbls., $11@12.50. Nuts—Peanuts, Virginia, $1.40@1.55; do. Wilmington, $1.75@1.80; do. Tennessee, 75@90c.; Hickory nuts, $1@1.75. Black walnuts, 50c. Pecans, 12@13c.

FLOUR.—There has been an exceptionally dull market, with offerings liberal and prices weak. Export trade is almost at a pause.

Superfine State, $4.35@4.65; extra do., $5.00@5.30; superfine Western, $4.35@4.65; extra do., $5.00@6.00; No. 2, $3.25@4.15 extra round-hoop Ohio, $5.00@5 40; trade brands do., $5.40@7.75; white wheat extras, $6.65@7.00; St. Louis, $5.20@9.00; City Mills extra, $5.00@8.50; Southern at $4.35@4.75 for superfine; $4.80@6.25 for pour to choice shipping extras; $6.30@8.75 for trade and family brands. Rye, $4.10@5.05. Corn meal—Western yellow, $2.70@3.25; Jersey & Penn., $2.90@3.25. Buckwheat selling at 38@40c. for prime State, and flour at $1.82@2.25.

FURS AND SKINS.—The quotations for furs and skins are as follows:

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50
Cat, Wild, North and East States, cased	50 to 60
Cat, Wild, Southern and Western	40 to 50
Fisher, Northern and Eastern	7 00 to 12 00
Fisher, Southern and Western	3 00 to 8 00
Fox, silver	15 00 to 50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00 to 5 00
Fox, Red, Northern and Eastern, according to size and color	1 50 to 1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25 to 1 50
Fox, Red, Southern and Western	75 to 1 00
Fox, Gray, North and Eastern, cased	75 to 1 00
Fox, Gray, South and West	40 to 60
Fox, Kitt	30 to 50

Wolf Skins, prairie, prime	75 to 1 25

GRAIN.—For wheat there has been a very dull market, with prices lower and closing weak; the markets abroad are in unsatisfactory shape; latest sales at $1.29@1.30 for very choice old No. 2 Milwaukee spring to store; $1.05@1.18 for ungraded and mixed spring; $1.25 for prime No. 2 Milwaukee spring milont; $1 for rejected spring; $1.35 for common white Western, in car lots; $1.01 for "no grade" red winter; $1.20@1.47 for winter red and amber; $1.35@1.55 for white and $1.20@1.37 for No. 1 spring. Rye at 88@91c. for State, and 86@88c. for Western. Barley small sales of two-rowed State at 70@90c. Barley malt at $1.12½@1.45 for Canada; 85c.@$1.07½ for two-rowed state; $1.10@1.25 for four-rowed State. Corn is lower, with larger supplies. Sales at 63@66c. for new mixed Western; 66@64c. for ungraded new mixed Western; 59@59½c. for "no grade" new mixed; 61c. for new yellow Western; 62@63c. for new yellow Southern and 69½@72c. for old mixed Western. Oats are more in favor of the buyer, with larger supplies. Sales at 46@47c. for prime mixed Western; 49@51½c. for white Western.

HAY AND STRAW.—The weather is favorable. Shippers have been operating freely, and the increased receipts are closely used up; prices generally are steadily held.

Bale hay is quoted:—Shipping, 75@80c.; retail qualities, 95c.@$1.10; clover, 65@75c.; salt, 60@70c. Straw is quoted at $1.05@1.15 for long rye; 80@85c. for short rye; 75@80c. for oat.

Exports past week, 730 bales; since Jan. 1st, 4,418 bales; same time last year, 5,589.

HIGHWINES.—Selling at $1.11.

HOPS.—The market continues firm, and demand quite active. A thousand bales of choice hops have cleared for export this week; shippers do not want to pay over 17c. for best. There is a great scarcity of fine hops. As the better grades are cleared off, seconds and low must generally come into use. The average is 2,486 bales per week since September 1st, 1875. The quotations are:

New York State, 12@17c.; Eastern, 10@15c.; Wisconsins, 10@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias, 17@20c.

LEATHER.—Hemlock solc, light averages, 22@23½c.; middle, 24@25½c.; heavy, 24@26c., good dam., 21@23c.

OIL CAKE.—Western has been taken freely at $43 ₱ ton. Receipts here are liberal, but they comprise in good part parcels on direct shipment abroad.

POULTRY AND GAME.—The supply of choice dressed has been light and has brought pretty full figures. Parcels that arrive weather damaged are irregular in price, as at present there are but few calls for anything off in quality. We quote:

Chickens, Bucks Co., good to prime, 18@19c.; Jersey, good to prime, 18@19c.; State, good to prime, 15@17c.; Western, good to prime, 14@16c.; fair to good, 12@14c.; poor, 9@11c. Turkeys, Jersey, good to prime, 17@19c.; State, good to prime, 16@18c.; Western, good to prime, 15@17c.; inferior, 11@13c. Ducks, Jersey, good to prime, 20@22c.; State, good to prime, 19@21c.; Western, good to prime, 18@20c.; fair to good, 15@17c.; poor, 13@15c. Geese, Jersey, prime, 12@14c.; State, good to prime, 11@13c. Capons, 25@28c. Ships, Western, 18@19c.

Live poultry is tending lower.

Turkeys, Jersey, ₱ lb., 14@15c.; do. Western, 13@14c.; Geese, Jersey, ₱ pair, $2.50@3; do. Western, $1.50@1.75; ducks, Western, ₱ lb., 65@75c.; ducks, Jersey, ₱ pair, $1@1.25; fowls and chickens, State and Jersey, ₱ lb., 14@15c.; do. Western, 12@14c.; roosters 7@9c.

Game sales easier as the season is winding up. The recent high prices checked the demand, and steady buyers have more or less withdrawn.

We quote at $1.50@1.75 for Canvasback ducks; $1 for Redhead, 75@80c. for Mallard and 40@60c. for common per pair. Rabbits and hares plenty and dull. Wild pigeons sold early in the week as low as $1.50. At present they are scarce, and a prime lot would bring our quotation.

Wild pigeons, feathered, per doz., $2@2.25; Quail, trapped, prime, ₱ doz., $3@3.25; soft, $2.25@3.75; Grouse, prime, ₱ pair, $1.10@1.20; inferior, 50@70c.; Partridges, choice, ₱ pair, $1@1.15; inferior, 50@70c. Hares, ₱ pair, 20@30c. Rabbits, ₱ pair, 30@40c.

PROVISIONS.—There has been considerable excitement in the market for hog products generally. Exporters have brought freely and prices are advancing sharply. Mess pork quoted at $23 for spot lots; $22.85@22.90 for March; $23 for April; $22.10 for May; $23.15 for June; extra prime, $17.50; prime mess, $21. Dressed hogs at 10¾@10¾c. for Western. Tierced pickled hams, 13@14c. Boxed dry-salted shoulders 9c. Bacon at 12c. for Western long clear; 12¾c. for city do.; 12¾c. for short clear, and 12¾c. for long and short clear, together. Lard at $13.50 spot and Feb. 13-52½c. for March; 13.65@13-67½c. for April; 13-82½@13.85c. for May; 13.90@13.95c. for June. Stearine at 14c. for prime Western. Tallow at 9¾@9¾c. Beef hams at $25.00@26 for choice Western. Beef—New extra mess at $12@@12.50; do. plain mess, $11@11.50; do. tierced at $23 for prime mess, and $25 for India mess. City extra India mess, $32@33.50 (old extra mess, $11.50; 10.50 for plain mess; packet, $15.50@16.

SEED.—Clover is in liberal supply and lower. State held at 13¾@14c. for prime to choice lots.

SUGAR (Refined).—Soft yellow, 8¾@9¾c.; soft white, 9¾@9¾c.; crushed, 10¾c.; powdered, 10¾c.; granulated, 10¾c.

TOBACCO.—There has been a fairly active export demand and more doing from other sources, with prices steadily held. We quote:

VEGETABLES.—Exports of potatoes past week 6,302 bbls.; since Jan. 1st 37,416 do.; same time last year 18,790 do. There is evidently no hope for a rise in potatoes. Quantities are reported on the way from the West, and near points are not yet drained of them. Onions are running poor.

Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.50@1.75; Prince Alberts, $1.00@1.25; Peerless, 85c.@$1.00, Sweet potatoes, $2.25@2.50. Cabbages, ₱ 100, $3@5; red, $6@10. Cauliflower, bbl., $2@3. Squash, Marrow, bbl., 50@75c.; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@3.00. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00. Baltimore spinach, ₱ bbl., $1.50@2.

WOOL.—There has been a fairly active business from manufacturers, and with the moderate stocks prices are firmly held. We quote:

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Feb. 19, 1876.

THE brisk demand by shippers and the improved home trade in cheese has strengthened the market here and fine goods are held very firmly. For September and good October 14c. is asked. This is at present above the views of buyers and there are no transactions to note. We learn that Mr. L. D. Snell, one of the buyers at this market, has recently brought 3,000 boxes of the Markfield Factory, Cattaraugus Co., fancy Septembers, at 13¾c. at the factory.

"Late ends" of factories may be quoted at 10¾@11¾c., extra lots bringing ½c. and upward more. Farm dairies come forward only in small lots—the end of the season's make—and are generally common or inferior in grade. They go at 7@8c., according to quality—with occasional sales at 10c.

There is not much winter butter now on delivery, and it is not first-class. Sales are made at 23@26c., according to quality.

We have advices from Europe up to the first week in January. Our London correspondent says:

Large transactions in American cheese of all sorts are reported, while fine English and Dutch are firmly held. The prices are as follows:

American extra, 65s.@66s.; fine, 62@64s.; good, 56@60s.; common, 30@50s. English cheddar brings 84@91s.; Wiltshire double, 70s.; Cheshire medium, 56@68s.; fine, 74@84s.; Scotch, 66@70s. Dutch cheese—Edams, 75s. ₱ cwt.

Fine descriptions of butter are scarcer, and realizes unprecedented high rates. There is an improved demand for good intermediates. American and substitutes.

Clonmells sell for 150s.; Dorsets, 160s.; Danish and Swedish, 168s.; Normandy extra, 116s., and some have sold as high as 184s.; American and Canadian, 90@125s. ₱ cwt.

Oleomargarine or artificial butter brings 100@120s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Feb. 19, 1876.

SHEEP AND LAMBS.—Monday trade opened slow in sheep at 5¾@7¼c.; Wednesday, the same tone of trade; sheep sold at 5@6¾c. Thursday, trade fair at 5¾@8¾c. Friday, the markets closed fair at 5@7¾c. Lambs not on sale. The quality of the flocks to hand has been from course to fair, with only a few carloads of good quality sheep. Ohio sheep sold at 5¾@7¾c.; Indiana, 5¾@6¾c.; State, 5@6¾c.; Colorado, 4¾c.; Illinois, 5¾@6¾c.

HOGS.—Trade small; 250 corn-fed Ohio hogs, weight 192 lbs. ₱ head, sold at 8...c. ₱ lb.; 139 choice quality Ohio pigs, 21,780 lbs., $5.56¾. City dressed limited in sale, owing to high rates, which have been firm at 9¾@10¾c.; general sales of hogs 200 lbs. ₱ head, 10¾@10¾c.; 230 lbs. down, 10¾c.; 18 lbs., 10¾c.; 160 lbs., 10¾c.; rough hogs, 230 lbs. upwards, 10c.

HORSE MARKET.—City trade moderate. Twenty head of roadsters with fair trotting action, $215@400 ₱ head; 34 head of poor quality light harness horses sold at $30@75 ₱ head; 21 ordinary do., $100@200 ₱ head; 19 head course quality heavy draft horses, $110@200 ₱ pair; 2 pairs choice quality do., $500 ₱ pair; 5 pairs family carriage horses, $300@575 ₱ pair. Forty-four horses arrived ₱ Erie Railroad, via Oak Cliff Station.

New Advertisements.

GRAPEVINES for Agents and Planters, from my stock of LARGEST VINES in the country. I. H. BABCOCK, Lockport, N. Y.

I have founded my business on the belief that the public are anxious to get their seed *directly from the grower*, and I therefore offer FREE to every man and woman in the United States who cultivates a farm, fills a vegetable garden, or plants a flower garden, my large, Illustrated Catalogue of Vegetable and Flower Seeds for 1876; it contains, in addition to the choicest kinds produced in Europe, *one hundred and fifty varieties of vegetable seed grown on my four seed farms.* Customers of last season need not write for it. As the original introducer of the Hubbard, Marblehead and Butman Squashes, Phinney's Melon, the Marblehead Cabbages, and a score of other new vegetables, I solicit your patronage. All seed sold under three warrants. A hundred thousand Catalogues will be issued and sent out on the first of January.
JAMES J. H. GREGORY, Marblehead, Mass.

NEWS CONDENSER.

— Lent begins the first of March, this year.

— There are fewer cattle in Texas than formerly.

— Texas has a population of 1,275,000. In 1870 it was 818,619.

— A German iron-clad fleet will visit American ports next year.

— A petrified sunflower has been found in Logansport, Ind.

— Decatur has the reputation of being the muddiest town in Ill.

— Five thousand Indiana school teachers will go to "see the Centennial."

— One hundred thousand sheep were scattered by a California snow storm.

— Under the new constitution of Texas, nine of a jury may render a verdict.

— Two hundred and fifty thousand gallons of beer are sold in London daily.

— It is proposed in the Ohio Legislature that the State publish its own school books.

— Eighteen thousand one hundred and forty-four Chinamen came to California last year.

— Abington, Mass., has not a pauper, and the Selectmen have advertised the almshouse for sale.

— The Young Men's Christian Association of Buffalo, celebrated its 23d anniversary, Feb. 13th.

— A sweet potato weighing twelve and one-quarter pounds has been raised in Tallahassee, Fla.

— The Buffalo Board of Trade has appointed a committee to visit Albany and secure favorable canal legislation.

— Under a new ruling of the Buffalo School Board, no married women are hereafter to be employed as teachers.

— A Natural History Museum, with an enormous tank in the basement for fish, has been completed at Copenhagen.

— Street railroads are unprofitable in most Southern cities. The cars in Macon and Montgomery have ceased running.

— The Major-Domo of the Pontifical Palace at Rome has just ordered 500 lightning conductors for the Vatican and St. Peter's.

— Sixteen thousand two hundred and eighty-eight patents were issued in the United States last year, an increase of 2,689 over 1874.

— The coinage at the Philadelphia Mint in 1875 amounted to $11,514,835, being rather more of gold than silver, and $246,970 of base metal.

— Surveys are being made of the country around London with a view of some definite steps being taken for the defense of the metropolis.

— A Washington correspondent says that the favorite game with Congressmen this winter is euchre. Still, draw poker has its votaries.

— Fish packers in Nova Scotia, finding their occupation gone, are now packing rabbits, partridges, and other game for the English market.

— Every member of the Kansas House of Representatives is provided with twenty daily newspapers during its session, at the public expense.

— Eight prominent physicians of Albany, N. Y., propose to establish in that city a private hospital for the accommodation of private patients only.

— The recent death of a Canadian Judge renders it necessary for forty cases which he had taken into consideration to be argued over again.

— Orange County, N. Y., claims that it produces the best butter, the fastest horses, and the most apple whisky of any county in the United States.

— Last year the town of Winter, Cal., was a wheat field, and a crop was gathered from it. Now it has 1,200 inhabitants, and town lots are worth $600.

The New York Commercial Advertiser prints a table showing that the amount of default on railroad bonds alone since the panic of 1872, is $783,967,665.

— The ravine running from East Buffalo to the hydraulics overflowed its banks, Feb. 11, and caused about $5,000 damage to property in the vicinity.

— The Lehigh Valley Railroad Company are surveying a route for a new railway, from Elmira to Geneva, via. Watkins, along the east shore of Seneca Lake.

— At the close of 1875 there were 1,006 students on the rolls of the College of the City of New York. The receipts were $150,757.52; the expenditures, $149,836.80.

— In France, where every newspaper article must have a signature, the responsibility is frequently avoided by paying some noted duellist to affix his name.

— A petroleum gas man is urging the city fathers of Chicago to give him a contract for lighting the streets, agreeing to do for $75,000 what now costs the city $500,000.

Dairy Salt.

THE AMERICAN DAIRY SALT COMPANY

J. W. BARKER, Pres't and Sec'y. THOMAS MOLLOY, Treasurer.
General Office, No. 1 Clinton Block, Syracuse, N. Y.

Sole Manufacturers of the Celebrated Onondaga Factory Filled

DAIRY AND TABLE SALT.

Respectfully call the attention of Dairymen and others to the quality of Salt now being manufactured by them.

Having for many years past been engaged in perfecting the various processes for the manufacture of this salt, and by adopting the best modes and machinery for the purpose, they feel warranted in saying to the consumer that the article now produced is superior to any other, either of foreign or domestic production. The following is an analysis of our salt and the Ashton, made in April, 1875, by Messrs. Waltz and Stillman, Chemists, of New York, under the direction of a Committee of the Butter and Cheese Exchange of New York, the samples being selected by the Committee from lots found on sale in market:

	Ashton.	Onondaga.
Water	0.7880	0.6280
Insoluble Matter	0.0561	0.0364
Sulphate of Lime	1.2272	0.7217
Sulphate of Magnesia	0.0769	.....
Chloride of Calcium	.....	0.0173
Chloride of Magnesium	0.0591	0.0346
Chloride of Sodium	97.7593	98.5243
	99.9674	99.9822

Circulars in regard to the various other tests made with this salt in comparison with the best foreign article, also certificates from a large number of the best dairies in the State as to its quality, may be had on application to J. W. BARKER, Secretary, Syracuse, N. Y., to whom orders for salt may also be addressed. It is also for sale by the Agents of the Company in principal Western Lake Ports; by ST. JOHN & AVERY, 101 and 103 Broad St., New York; ROBERT GEER, 109 Pier, Albany, N. Y.; E. W. PECK & Co., Burlington, Vt., and by dealers generally throughout the State of New York.

Inquire for ONONDAGA FACTORY FILLED SALT.

Wit and Humor.

SPARKS AND SPLINTERS.

GOING to law for damages is the surest way of getting damaged.

HERE and there the sin of naming new babies "Centennia," is committed.

THE steamer that is over-due must be coming in with a very light draught.

WHY is your wife like dynamite? Because she's apt to blow up if harshly handled.

UPHILL buisness—sitting on a wheel-barrow and trying to wheel yourself to glory.

"SAM JONES, what ails your eye?"—"Nothing, only I told Jim Smith he hed and the fool resented it."

THE fool seeketh to pick a fly from a mule's hind-leg. The wise man letteth out the job to the lowest bidder.

TRYING to do business without advertising is like winking at a pretty girl in the dark—you may know what you are doing, but no one else does.

"Do you love me still, John?" whispered a sensitive wife to her husband. "Of course I do; the stiller the better," answered the stupid husband.

"ALFRED, darling," tenderly observed a young Milwaukee wife to her husband, "I wish you'd take your ears down now, Marian wants to dust the ceiling."

AN Illinois girl wrote to the School Commissioners of Chicogo that she "had bin out of employment for a year, and wud teech for $10 a month and bord round.

THE following advertisement recently appeared in a London paper:—"Three Lady Helps wanted, as cook, housemaid, and nurse; private family; no servants kept."

IT is estimated that it takes a young man twice as long to light a lamp when he returns home from a lecture or concert with his girl, as it does under other circumstances.

THIS may possibly be old, but it's undeniably good:—"Every man fancies he can do three things—farm a small property, drive a gig and write an article for a review."

A LONG and romantic story published in the Michigan papers may be thus condensed: "Beautiful daughter of a Michigan banker; married against her father's will; beer girl in a Lafayette concert hall."

A FACETIOUS boy asked one one of his intimates why a hardware dealer was like a boot-maker. The latter, somewhat puzzled, gave it up. "Why," said the other, "because the one sold the nails and the other nailed the soles."

A SCHOOL TEACHER got the boys down on him by taking their apples away from them when they had them around in school time, and eating them himself, but he looks at them very carefully since he ate one charged with red pepper.

"WELL," remarked Mrs. Spilkins the other evening, throwing down the paper with a sigh, "I don't think so very much of the President's message, Leander. He don't say a single word about Tweed's escape, or the Beecher scandal."

DOBB'S memory is not of the best, and he rather suprised his sweetheart the other evening by asking her if these lines of Scott were not beautiful:

> Oh, woman, in our hours of ease,
> Uncertain, coy, and hard to please;
> But seen too oft, familiar with thy face,
> We first endure, then pity, then embrace,

AN OPINION.—A highly respected colored gentleman, rejoicing in the big-sounding name of George Edwin Fitz-Augustus, visiting the Washington Market, a few days since, thus delivered himself to a fat countryman, whose stock of vegetables he had been busily investigating: "Are these good taters?" "Yes, sir!" responded the countryman. "A tater," resumed George Edwin Fitz-Augustus, "is inevitably bad unless it is inwariably good. Dere is no mediocrity in de combination of a good tater. The exterior may appear remarkably exemplary and beautisome, while the interior is totally negative. But, sir, if you wends the article ob your own recommendation, knowing you to be a man of probility in your transactions, I, widout any furder circumlocutions, takes a bushel of dat superior wegetable!"

Housemaid—"Oh, Please m'm, if that's anybody for me, I'm '*not at home.*'"

"GENERAL FAVORITE"
No. 2,
Recently perfected and offered to the trade by the
WEED SEWING MACHINE COMPANY,
Possess many advantages, both in construction and capacity, over machines now in use by
MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

$700 IN PREMIUMS
TO BE AWARDED TO POTATO GROWERS BY B. K. BLISS & SONS

$500 to be divided among the six most successful growers who shall produce the largest quantity from 1 lb. of **RUBY** and **ALPHA** potatoes. Price of each, $1.00 per lb.

CENTENNIAL PREMIUMS.

$150 to be awarded for the best collection, one peck each, of potatoes introduced by us since 1867.

$50 for the best and most promising seedlings raised this year from **Pringles Hybridized Potato Seed.** The collections for which the last two premiums of $200 are offered will be exhibited at the Centennial Exhibition, in Philadelphia, in October, and premiums will be awarded by their committee. For conditions and full particulars send for circular, mailed free to all.

Bliss's Illustrated Seed Catalogue & Amateur's Guide to the Flower & Kitchen Garden. 200 pages, 35 cts.

Bliss's Gardener's Almanac and *Abridged Catalogue of Garden, Field and Flower Seeds.* 116 pages, beautifully illustrated, mailed to all applicants inclosing 10 cts.

Bliss's Illustrated Potato Catalogue contains a descriptive list of all the new varieties recently introduced, with many other desirable sorts, also much useful information upon their cultivation. 32 pages, 10 cents.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

The Centennial.

THE MAIN EXHIBITION BUILDING.

In our series of illustrations representing the great Centennial Exhibition in Philadelphia, we this week give an illustration of the Main Exhibition Building, which is described as follows:

The main building extends east and west 1,876 feet.—a symbolical number—and is 464 feet in width. The main portal on the north side communicates directly with the Art Gallery, and the main portal on the west side gives the main passage-way to the Machinery and Agricultural Halls. At the corners of the building are four towers, 75 feet in hight, while to obtain a central feature for the building the roof over the central part, for 180 feet square, is raised above the surrounding portion, and four towers, 48 feet square, rising 120 feet, are introduced at the corners of this elevated roof. The areas are:

	Sq. ft.	Acres.
Ground floor.....	874,220	20.072
Upper floor, in projections,	37,344	.85
Upper floor, in towers,.....	26,344	.85
Total.....	933,008	21.47

The main hall is 360 feet wide by 1,402 feet long, with an annex on the south side 208 feet by 210 feet: the area of hall and annex is 558,440 square feet, or 12.82 acres, and including the upper floors, it covers a space of 14 acres (floor space). There are two main avenues 80 feet wide, 1,360 feet long, with a center aisle and an aisle on either side. Each aisle is 60 feet wide, the two avenues and three aisles giving a total width of 360 feet. In the center of the building is a transept 90 feet in width, beginning 36 feet from the main hall, extending 208 feet, is flanked on either side by aisles 60 feet in width, and forms the annex for hydraulic machines. The promenades are 15 feet in width in the avenues, 25 feet in the transepts and 10 feet in the aisles; all other walks are 10 feet in width and lead to exit doors. The columns are 16 feet apart, 40 feet high to the heel-block of the 90-feet span roof-tresses over the avenues. The outer walls are masonry to a hight of 5 feet, and above they are composed of glazed sash between the columns. Eight main lines of shafting may be introduced, extending almost the entire length of the structure; and counter-shafts can be introduced into the aisles at any point. In the hydraulic annex at the south end there is a waterfall 35 feet high and 40 feet wide, to be supplied from the tank by the pumps on exhibition.

NOVEL CENTENNIAL CELEBRATION.

Senator McCreery of Kentucky, while the Centennial appropriation bill was before the Senate, moved to substitute the following novel proposition:—"That it be recommended to the people of the United States to assemble on the Fourth of July next, in such numbers and manner as may be convenient, in their respective cities, towns, villages, neighborhoods or wherever they may be, publicly to testify their joy of the one-hundredth return of that auspicious day, by suitable eulogies, orations and discourses, or by public prayers and such religious exercises and ceremonies as may be appropriate to the occasion and sanctioned by their own conscience."

We feel very much about this as the Western couple did when stopping to breakfast at a fashionable hotel on their bridal tour. The table waiter asked if they would take ham and eggs and buckwheat cakes, "Of course not," quietly spoke the lady. "We get enough such victuals at home, now we are away we want something different from every-day fare." The country is familiar enough with the programme of Fourth of July orations, eulogies and speeches, to say nothing of public prayers and religious exercises. These are all very well in their way, but once in a hundred years the country can well afford to give itself a treat of a different, if not a better kind. Still we doubt not, that the local celebrations of Independence, will be more generally and enthusiastically observed this year than ever before. Possibly the religious element will be more predominant, as it should be in an anniversary, showing the progress and preservation of our country during several generations of human lives. After one hundred years existence and prosperity of our people as an independent nation, it must be quite plain that our country has not been preserved by any one man or party, for all the founders of the Republic have long since passed away. One after another, as the country needs them, men are being raised up to preserve the institutions which our fathers founded, and no one man ever has been or will be necessary to the security of our people. These facts cannot fail to impress all thinking minds with thankfulness for the guidance of Providence thus far and equal reliance for the future, and this feeling cannot be properly ignored in the exercises at the National Centennial Exposition in Philadelphia.

CANADA AT THE CENTENNIAL.

The Toronto Globe says that it has been decided by the Ontario Advisary Board that the representation of farm products at the Centennial should be by counties. Accordingly circulars were issued as long ago as last September to the officers of the various Agricultural Societies, notifying them of the proposal arrangement, and requesting that two quarts of each kind of grain and seed should be sent in to the Secretary. It was found necessary, owing to this request not having been complied with, to issue a second circular in December, giving a list of of the agricultural products required. As some time will be required for the arrangement of the specimens, it is absolutely necessary that the parties addressed should respond as promptly as possible. The representation by counties presents many advantages over the representation of the Province as a whole, the method formerly adopted. As some counties will undoubtedly be well represented by specimens, all will find it to their interest to be so, if none are to be placed at a disadvantage as compared with others. The number of entries of exhibitors of manufactured articles now amounts to 469, with from 1 to 106 samples each: it is extremely desirable that the farmers and fruit-growers should not be behind.

THE FIRST AMERICAN CENT.

The item going the rounds that the first coin called a cent, was proposed by Robert Morris, and first issued in 1792, is contradicted by the Detroit Evening News, which says that Mr. R. E. Roberts of that city, has a cent of still earlier date. It has on one side the sun and dial, underneath which the words "Mind your Business," and on the sides "Fugio" and "1787." On the reverse a circle of thirteen rings, on which is stamped "United States," and in the centre "We are One." It has always been understood to have been designed by Dr. Franklin. Such is a correct description of the first cent. In this Centennial era correctness in matters of history is important. In this connection the question arises, as it has about pins, where have the millions of old red cents made by the government gone to? the answer to which is very simple. The old fashioned large red cents contain more than a cent's worth of copper, or at least did so for a number of years. They were carefully saved and melted up for copper, and now may be found in copper utensils of nearly every kind, and also reappear in the smaller copper cents issued by the government.

Mast, Foos & Co. of Springfield, Ohio, are to furnish a 400 horse power sectional tubular boiler for Agricultural Hall, and to run the machinery of the Centennial Exhibition.

Farm Economy.

PORTABLE FENCES.

This subject, which has often been up during the past thirty years—introducing all sorts of patent and no patent fences—is again in order and thus suggestively discussed by the Naturalist and Farmer:

Where it is desirable to set up a fence for enclosing a field for a single season, or for a few years at most, some sort of a portable fence is decidedly preferable to the more expensive and substantial stone wall, or even a wooden fence of posts and rails. Sometimes one may have a few calves that he would like to give a small enclosure in some mowing field, or a sick animal may need a field by itself. A sow with pigs or a few sheep may need a special enclosure for a month or two, after which the fence might be no longer needed in the same place. Under such circumstances, some kind of a light, cheap fence, that can be readily put up and taken down again, will prove very convenient and may pay a good per cent. on the cost of making and setting it.

The fence described at the winter meeting of the Connecticut State Board of Agriculture at Winstead, by Mr. Hubbard of Middletown, struck us as being the best thing of the kind that we have ever seen. It is plain, simple, light and cheap and when set up and properly pinned, will turn all kinds of stock that should ever be enclosed by fences.

The stock required for such a fence consists of four boards, 12 feet long by 6 inches wide, equal to 24 feet; two pieces of 2x4 joist, 5 feet long, equal to 3⅓ feet; two stakes for props 4½ feet long, which may be round saplings from the woods; two pieces of board 2 inches wide and a foot or more long, and about 20 tenpenny fence nails. The tools needed for building such a fence are a hammer, an inch and a half auger, a half inch bit and a saw, all of which any farmer should be competent to use.

The fence should lean *from* the field to be pastured with the props upon the opposite side, although cattle may run on either side with little danger of its being thrown down or broken. For calves, pigs, or other small animals, a fence one-fourth lower might answer as well. When finished and set up, it will stand as firmly as a wood-sawyer's horse, and may be removed and re-set in a new locality about as easily.

During the discussion which followed the exhibition of a model of this fence by Mr. Hubbard, several farmers criticised it because it was proposed by some gentleman to have the panels lock into each other and be confined together by nailing or otherwise; but this would defeat the very object that Mr. Hubbard had in view, that of making a fence that should not stand in the same place a long while without moving.

As fast as the farmers outgrow the idea of keeping up a great amount of permanent fence for dividing their mowing and tillage lands into small lots, they will appreciate the advantage of a kind of light and cheap portable fence that can be put up or taken down in a few hours around crops that need protection for a short time, or for enclosing young stock at certain seasons, or the after-feed in mowing fields. But what we most need to learn at present is the false economy of building and trying to support so many unnecessary fences around and across our tillage lands. Pastures must be fenced for the present, but the time will come when fences around mowing lots and gardens and by the roadside will be far less common than is the case now. People are learning that fences cost more than they are worth, and Yankees don't like to trade in that way a great while after they learn the fact.

POTATOES AS FOOD FOR STOCK.

Potatoes in many localities distant from market are this season so abundant and cheap that they can only be used to advantage for feeding out to stock. It is true that certain agricultural writers have of late endeavored to show that this valuable tuber was of little or no value for such purposes, but it is very probable that the gentlemen who advance such theories are not practical agriculturists. The value of the potato as food for man and many of our domestic animals is too well known to be discarded at this late day in consequence of anything which may be written by theoretical chemists or agriculturists.

But while the potato has been a bone of contention among agriculturists for many years, its practical and specific value as food for stock has never been disproved when put to the test. The celebrated veterinarian, Wm. Youatt, in speaking of the value of the various kinds of roots as food for stock, says of the potato:—"Among the various vegetable productions that have been appropriated to the stall-feeding of cattle, none have occasioned greater discussion than potatoes. They furnish an excellent supply, particularly when cut and steamed, and appear adequate to the fattening of neat cattle in combination with comparatively small portions of other food."

In the eleventh volume of the British "Annals of Agriculture" we find some statements from Mr. Campbell of Charlton, Eng., which bear directly upon this question. He observes that 100 pounds of potatoes and 700 pounds of hay are generally sufficient to fatten any animal that thrives tolerably well. They should at first be given in small quantities and gradually increased to one or two bushels per day: dry food being always intermixed and the proportion of hay being uniformly regulated by the effect which the potatoes produce on the bowels. The hay should always be cut, in order that it may be more readily mixed with the potatoes.

We might give almost any amount of testimony from practical farmers and stock-raisers to corroborate the above, but think it entirely unnecessary, as it is quite likely that a majority of our readers know from experience that potatoes are valuable food for stock. At the present price of beef, cheese, butter or pork, we think our farmers would do better to feed out their potatoes than to sell them at twenty cents per bushel and less, prices at which they have been sold in many localities this season. Potatoes are too heavy and bulky a crop to send to a distant market, but they are readily turned into beef, cheese or butter, and in these forms the cost of transportation is greatly reduced.—*N. Y. Sun.*

EXPERIMENT WITH SUPERHPHOSPHATE.

Having been a subscriber to the Rural New-Yorker for the last eighteen years, I have read with interest the recorded results of accurate experiments made by practical farmers, and consider them by far the most valuable of my agricultural reading. Thinking it might be of benefit to others, I will give the result of an experiment tried by myself the past season. Wishing to use more fertilizing material than I had on hand last spring, I concluded to get some superphosphate, and, not knowing what kind was best, bought some of three different kinds. I applied it to oats and potatoes at the rate of 250 lbs. per acre. The kind that proved the most valuable was manufactured by Alexander & Crocker of Buffalo; it was advertised in the Rural. Where applied to potatoes, it just doubled the weight of salable potatoes.

My mode of application was—after lightly covering the potatoes with earth—to apply one small tablespoonful of the superphosphate directly over the potatoes, and then cover that lightly also. I was afraid the phosphate might be too strong if put in with the potatoes. The ground was a gravelly loam, quite poor, having had no manure for several years. The hills were 18 inches apart, and the rows 3 feet. The difference in the vines could plainly be seen all through the season, being about twice as large as those having no phosphate. I intended having the experiment with oats accurate also, but a rainy time of ten days, just as they were ready to cut, so injured them that I was discouraged and harvested them altogether. It was very evident to me that the phosphate paid well on the oats. It was drilled in with the grain. The grass seed seemed to catch better also.

Rome, N. Y., Feb. 16. F. D. Perkins.

RENOVATING IMPOVERISHED LAND.

In a recent address, Prof. Stockbridge of Massachusetts said:

It is possible to make these old, worn-out hills of Massachusetts flourish with waving fields of grain and grass, by the use of the chemical elements of nutrition; and it is not necessary to keep cattle for the express purpose of making manure. I do not wish to be understood as "going back" on barnyard manure, but would use all that has accumulated as a waste product in the prosecution of agricultural pursuits. Making butter, cheese, beef and pork is like other manufacturing industries, and is a legitimate industry. But the time for carrying on these operations for the express purpose of making manure is soon to pass away. In the near future the value of barnyard manure would be estimated by the value of the nutritive elements it contains. As every farmer here, I suppose, is intending to ask what these elements cost in the market, I will state that, at present prices for nitrogen, potash and phosphoric acid, the plant food for a bushel of corn should cost forty-one cents. I have applied manure for fifty bushels and obtained ninety-four bushels, worth, with the stalks, $134, which ought to pay me well for labor, taxes, interest, etc., over and above the cost of chemicals.

Another experiment with corn planted without manure, upon land manured last year, gave sixty-four bushels as the product of manure carried over from that applied last year. So it does not look as if we had ruined the land by applying these fertilizers. It may also be said that these experiments may work on little plots of a few rods, but when tried on large farms and by the acre they will fail. That we could test this also, two fields of the poorest common land, such as was considered too poor to pay for fencing, were planted with corn. One contained 154 and the other 192 rods. The yield of corn in these fields showed that such experiments in feeding crops were equally applicable to large as small fields. Besides the experiments carried on at the College, more than two hundred farmers from Vermont to the Carolinas have been experimenting in this same manner the past year, and with results highly satisfactory to themselves.

TOP-DRESSING MEADOWS.

The results of a single top-dressing on eight plots of nearly half an acre each of sandy warm soil of our State Agricultural College farm, exhibited the following facts at the end of three years:—The top-dressing was applied in 1864, and the grass was cut twice each season in 1864 and 1865, and once in 1866, and the produce of each lot weighed separately and a perfect record kept. The results for the four seasons were as follows:—On the plot to which no manure or fertilizer was applied, the total weight of hay yielded per acre was 8,740 pounds. Where two bushels of plaster per acre were applied, the yield per acre was 13,226 pounds, a gain of 4,484 pounds. Where five bushels of wood ashes were applied the yield per acre was 12,007 pounds, a gain of 4,165 pounds. Where three bushels of salt were sown per acre the yield was 14,969 pounds, a gain per acre of 5,227 pounds. Where twenty loads of muck per acre were laid on, the yield per acre was 13,816 pounds, a gain of 5,074 pounds. Where twenty loads of horse manure were laid on the yield was 14,686 pounds, a gain of 6 224 pounds. These are results which indicate that there are fertilizers which will produce as good results as plaster. For instance, the plaster yielded a gain of fifty-one per cent., while the horse manure gave an increase of seventy-one per cent., or nearly a ton more grass per acre in the three years.—*Michigan Farmer.*

Industrial Topics.

LARGE CORN CROPS MAKE CHEAP HOGS.

A central Kansas farmer contributes the following interesting statement to the New York Tribune:—This is the rule, and the notable exception this year is not fully understood by Eastern men. While we, here at the far West, have had good corn crops, witnessed by the fact that corn is now selling at 25 cents per bushel, we have no hogs to send to the market, but rather are buyers ourselves. I speak now particularly of the grasshopper-afflicted States of Kansas and Nebraska. During the visitation of these pests in 1874, instead of raising corn upon which to fatten stock, we were compelled to kill nearly all our hogs to keep them and us from starving. Now, with abundance of corn, we realize the advantage it would be, could we send it East in the form of pork, but we are bare of stock and are sending to Missouri and other States for a supply. Nor is it a mere handful of hogs that we want, for our denuded country is large, and our wishes only limited by our ability to purchase; for we recognize the hog crop is destined to be of great importance to this part of the country. The diverting the heretofore Eastern trade, or call for Missouri, Illinois, and Iowa hogs, and turning them Westward, is not sufficiently taken into account by Eastern people, many of whom are wondering at the light receipts and high prices of hogs.

ANGORA MANUFACTURES IN CALIFORNIA.

California, in pursuance of a characteristic fashion of doing what cannot be done elsewhere, has not only persisted in keeping considerable flocks of Angora goats, but multiplies their numbers and utilizes the fleece. There have been placed in the Museum of the Agricultural Department some specimens of dressed skin with fleece intact, of divers colors and great beauty, such as are used for fancy robes, rugs, mats, fur gauntlets, and for other purposes. These gloves are very strong, durable, warm, and showy. The leather is also used in strings for belt-lacing, and appears from its great strength to be very suitable for such use. This is the work of the Angora Robe and Glove Company, located at San Jose, and demonstrates the availability of Angora products for successful manufacture into articles of comfort and utility. Their gloves, unlike those of buckskin, are dressed with the grain left on. Mr. Frank Leavis, the Secretary of the company, is a part owner of a flock of six hundred ewes which were sheared last spring. In one county, Monterey, there are no less than twenty thousand returned by the assessors, and they constitute a portion of the stock of twenty-eight other counties.

THE WORKSHOP ON THE FARM.

As I commenced farming three years ago, I bought a set of planes, augers, chisels and a saw, and by-and-by some more tools that were needful to do the ordinary repairs of the farm, and soon I made some new implements out of wood. Last fall a blacksmith moved away from our village, and I bought a bellows, anvil, hammers, tongs, and soon I learned to do some smith-work. I never learned a trade, as I worked on the farm, and kept a country store for seven years. I would not give my tools for double what they cost me, as by patience and perseverance anybody can soon perform the common repairs on the farm.—H. E. E. R.

It is hardly true, as our correspondent supposes, that everybody can perform the common repairs on a farm. Probably he has a natural taste that way, and succeeds better than most would do. Still we heartily endorse the practical recommendation to have a workshop with anvil and bellows and a full set of blacksmith and carpenters' tools. Almost any farmer can save himself some expense and a good deal more trouble in making needful repairs. The boys especially will find in such a workshop an unfailing source of improvement and pleasure. Very many boys brought up on the farm, have a natural liking for mechanics, and in all cases this "bent" of the mind should be carefully studied, as on its development depends all after success.

ROTATION OF CROPS.

As desirable as rotation in office may be, it cannot be more so than a judicious rotation of crops raised on the farm. No matter how fertile the soil, it is conceded that constant cropping with one, two, or three kinds of grain, will wear out the land. All good farmers concede that a proper rotation of crops, including the grasses, should be followed. Chemists inform us that the nutriment of food-producing plants is taken in part from the soil in solution through the roots, and partly from the air through the leaves, and therefore that suitable food must be provided, or a manifest deterioration will result. The good farmer, while he aims to produce the largest crops at the least expense, will also be careful to keep up the fertility of the soil by a judicious rotation of crops, supplemented by the application of manures to the land.—*Rural World.*

GETTING RID OF STUMPS.

Some one, not long ago, started the idea that sulphuric acid would totally destroy stumps. An augur hole was to be bored in the top, filled with sulphuric acid, and plugged. In a day or two the stump would be eaten up, even to the very roots. The experiment was tried and failed, only a portion of the stump, at the top, being affected. The following method is recommended by the Scientific American:—In the autumn bore a hole one to two inches in diameter, according to the girth of the stump, vertically in the center of the latter, and about eighteen inches deep. Put into it from one to two ounces saltpeter; fill the hole with water and plug up close. In the ensuing spring take out the plug and pour in about one-half gill of kerosene oil and ignite it. The stump will smoulder away without blazing, to the very extremity of the roots, leaving nothing but ashes.

ABOUT PLOWING.

Seeing your repeated invitations to subscribers to furnish the Rural any hints or facts of general value that they are in possession of, I am emboldened to send you an item which I have found by experience to be of decided advantage. It is this:—In opening a land on a hillside, always turn the down-hill furrow first. The advantage is—in opening a land, one always wants to make the furrow straight as possible. The sod will turn down hill of itself. You can hold the plow much steadier than when turning the furrow up-hill, which gives you a better chance to guide the horses. And when you come to turn the up-hill furrow the leader has a guide to follow and needs but little driving, and you are allowed a better chance to cut a clear, regular furrow and lay it up smoothly.

A Young Farmer.

WORKMEN.

Mr. Ruskin says in the London Garden:—Supposing the captain of a frigate were by any chance obliged to place his own son in the position of a common sailor; as he would then treat his son, he is bound always to treat those men under him. So, also, supposing the master of a manufactory saw it right to place his own son in the position of an ordinary workman—as he would then treat his son, he is bound always to treat every one of his men. This is the only effective, true, or practicable rule which can be given on this point of political economy.

Dairy Husbandry.

THE PHILOSOPHY OF CURING CHEESE.

Address of X. A. Willard of the Rural New-Yorker before the Vermont Dairymen's Convention, Jan. 21, 1876.

[Concluded from page 135, last No.]

HOT WEATHER CHEESE.

I COME now to speak of "hot weather cheese"—cheese made in July, or in fact, at any time when the curing is carried on during intensely hot weather. It is almost needless to tell you that the great bulk of this cheese is more or less off flavor, the odor and flavor resembling that of putrid meat. The decomposition has taken on a taint that is decidedly offensive to the lovers of good, sweet food—often so intensely disagreeable as to cause vomiting when by mistake, or without warning from the olfactories, it has been taken in the mouth. Immense quantities of this cheese go upon the market every year, and whenever that happens there is a break-down in prices and heavy losses to the producer and not unfrequently to the dealer also. Every cheese manufacturer knows that the hot weather to which the cheese has been exposed in ill-constructed curing houses, has been the cause of this trouble.

If you stand in the market as I have done for the past 15 years, and see the sacrifice that is made from time to time by factories and dairymen on such goods, you will wonder why so little attention has been given to guard against these losses. The manufacturer will tell you that there are no means of controlling temperature in his curing rooms—that the cheese when two or three weeks old, was perhaps all right and ought to have been sold just at that moment, but the hot weather coming on was the cause of the trouble, and of course the goods must go at a lower price, or indeed at any price the dealer may choose to give.

Now it is bad flavor that injures American cheese, both at home and abroad, more than all other causes combined. A cheese may be dry and lack fat; but if it is clean, sweet and nutty in taste, it can be tolerated on the table; but a stinking, putrid lump of cheese can only be endured by the very lowest classes, who know nothing of the best kind of food, and are willing to take the worst without questioning.

A ROOM AT LOW TEMPERATURE NEEDED.

All factories should be provided with what may be called a refrigerator room—a room in some way connected with the ice house, in the plan if you please, of Crozier's Milk Cellar, where pipes are arranged to lead the cold air from the ice, thus reducing the temperature to 60 deg. or below and holding it low; then, as soon as the hot weather cheese has sufficiently ripened and while its flavor is perfect, let it be carried to the refrigerator room, where it may be kept at so low a temperature that fermentation and all change be arrested. Such a room does not cost very much, and cheese could be held, here for a few weeks in hot weather or until a favorable time for shipment, retaining the same flavor as it had when it left the curing room; and in this way large sums would be saved to manufacturers on account of "ill-flavored" cheese, while, by relieving the market from this class of goods, the consumption would be promoted and all classes benefited.

In England the large receivers of American cheese have their storerooms below the surface of the ground. These are well ventilated and with stone floors are so cool that the cheese when once cooled off, undergo but little change. I have seen cheese come in fearfully bulged and heated and to appearance almost a total loss; but the men in charge go to work immediately, removing the boxes and placing the cheese upon the cool stone floors and in a day or so, by turning and manipulating, the cheese are again in shape, when they are returned to the boxes and are ready to be offered for sale.

Is it not singular that a business of such magnitude as the dairy should continue, year after year, to make a wanton waste of its best goods, simply from a neglect of means easily supplied and within the reach of every establishment where cheese is produced?

OFFICE OF THE FAT IN CHEESE.

I have referred to moisture as one of the important elements of cheese, and I have a word now to offer concerning the fat. When I was in London in 1866, Prof. VOELCKER showed me a cheese from Norway which appeared to be exceedingly rich in butter. The caseine was completely broken down, the mass being so mellow and plastic as to be easily spread with a knife, like butter. It was sweet and clean flavored, and I was greatly surprised when informed that this cheese, on analysis, yielded scarcely any butter in its composition. With our present knowledge of cheese making, fat in cheese appears to be essential, not only on account of its own virtues as a food but as a promoter of fermentation. In skimmed milk cheese a larger quantity of rennet must be used than in whole-milk cheese, because in the latter the fat feeds the ferment and thus enables the caseine to be more easily and effectually broken down.

"The office of the fat and the transformation," says Dr. BASTIAN, "may be easily seen in a minute portion of Neufchatel cream-cheese. By placing a portion about the size of a pin's head upon an ordinary glass slip, moistening it with distilled water and spreading it into a thin film, the change which it undergoes can be readily watched. When kept in this moist, uncovered state, in a damp chamber, at a temperature of 65 deg. Fahr., I have found that at the expiration of 48 hours nearly one-half of the fatty-looking mass had undergone segmentation into fungi germs, many of which had in their turn grown out into well developed filaments.

Thus it would appear that a certain amount of fat in the cheese has an important influence in modifying and assimilating the other constituents so as to make the cheese mellow and palatable. From experiments that have been made, it has been found that a cheese with from 15 to 20 per cent. of fat, under proper manufacture and curing, will appear to be rich and mellow, with no indication of leanness, and quite equal in taste to much of the whole-milk cheese that we see in the market.

Whether we shall be able by our progress in knowledge and by our increase in dairy skill to make what seems to the taste to be a rich, mellow, palatable cheese from clear skimmed milk, remains to be seen; but that this is among the possibilities is believed by many. That we are to make a great advance in cheese making there can be no doubt, and this advance will be rapid when the attention of our cheese makers is turned to the improvement of the product by curing. The influence exerted by curing is very marked—for instance, in the Limburger cheese. The Limburger is a small cheese of about two or three pounds weight, of a brick-like form. If cured in the ordinary way, it would soon dry up and become almost as hard as brick. But they are placed in a damp cellar and are set up close together, thereby holding their moisture during the process of fermentation. And this moisture becomes so assimilated with the other parts that Limburger appears exceedingly rich in butter, and is so plastic that it may be spread with a knife, like butter. At certain stages of curing the Limburger is of a sweet, clean flavor, rich and mellow in texture, resembling Stilton; but the German taste requires that the fermentation be carried on until the odor and taste is very offensive to persons not accustomed to its use. It still, however, is plastic, mellow, and of rich, buttery appearance.

When I was in England I took some pains to look over the curing rooms in Somersetshire, where the famous high-priced Cheddar is made. Mr. HARDING told me the success of Cheddar was due quite as much to the curing as to the making. In the first place, the material for building the curing rooms is hollow brick, and they are constructed with hollow walls in addition. A nest of iron pipe runs round the inside walls of the rooms connected with the boiler below, so that the room may be heated with hot water. Care is taken to have good ventilation, while the range of the thermometer is allowed at no time to vary above 75 or below 70 deg.

After returning from England in 1866, I made some experiments in curing cheese which satisfied me that our July and August cheese could be kept in flavor while curing down mellow and rich and at the same time be increased in weight. I had arranged my curing room with openings even with the floor, provided with wickets, and with a ventilator running through the roof, also provided with a wicket, so as to be regulated at pleasure. The walls contained an air chamber, and I found that by the use of water at the wickets and on the floor during hot weather and by the arrangement of the wickets and ventilator, a pretty uniform temperature of 70 to 75 deg. could be maintained even in the hottest weather. We were making two cheeses per day of about 35 pounds each, and by keeping a moist atmosphere from time to time, so as to prevent the too rapid evaporation or drying out of the cheese, together with the even temperature, a very rich, fine, flavored product was the result: the cheese also keeping well—some of it being retained until the next season, perfect in flavor and mellow and rich in taste. The saving in weight over cheese as ordinarily cured was about four per cent.

CONSTRUCTION OF CURING ROOMS.

The question of the best manner of constructing curing rooms I shall not discuss in this connection. It is sufficient for me to state the conditions required. There are builders and architects who make a specialty of this matter, and they will tell you in what way a uniform temperature and good ventilation can be most economically secured. And it is important that this ventilation be good, in order that the emanations passing from the cheese be carried entirely out of the building and not be allowed to be condensed and fall back upon the cheese. Green cheese and cured cheese should not be kept in the same apartment. Hence all cheese, when it has arrived at a certain stage of maturity, should be removed to a room especially designed for this purpose.

SUMMARY.

We may now summarize the more important points in this paper:

1. That but little advance can be made in the quality of our best fancy cheese without especial care in curing.

2. That by proper attention in curing it is possible to reach the highest excellence in the cheese product. That by this means immense losses now annually sustained may be avoided, while consumption will be promoted.

3. That the proper temperature for curing cheese to get the best result in quality, has been determined by experiment to be from 70 to 75 deg. Fah.

4. That the temperature above named must be uniform, and that uneven temperatures, by alternately checking and unduly increasing fermentation, cause bitterness and other objectionable taint in cheese.

5. That moisture is an important element in cheese; that it should be properly distributed through the solids and so assimilated as to form one homogeneous mass, mellow and plastic, giving the cheese the appearance of great richness.

6. That at least from 30 to 33 per cent. of moisture should be retained in curing cheese; that as we decrease the percentage of moisture from this point, the percentage of butter must be increased to obtain mellowness of texture; that the cheese is not improved in taste by this substitution, which is often a serious loss, and this loss may always be estimated to be in proportion between the cost of water and fat.

7. That by proper temperature and attention in retaining a right proportion of moisture, the cheese is not only of better flavor and quality, but a saving in weight of from three to four per cent is made to the producer over the ordinary methods of curing.

8. That by the use of refrigerator rooms a cheese may be kept at any desirable point of flavor, and thus by holding when the markets are dull or the weather unsuitable for shipping, the intervening space of time may be bridged over by the factories without detriment to the flavor or quality of the cheese.

9. That with our present knowledge of cheese making a certain amount of fat in the milk is needed to make a good, palatable cheese. Hence excessive skimming, or a reduction of the fat in milk below 1½ to two per cent., is not to be recommended where the skimmed milk is to be made into cheese, unless other fat be substituted to supply the deficiency.

The Herdsman.

OIL-CAKE FOR MILCH COWS.

A CORRESPONDENT of the Toledo Farm Journal gives the readers of that paper the benefit of his experience, as follows:

Dairymen in this vicinity, where continued feeding of milch cows is requisite from five to seven months of the year, who have not tested the virtue of oil-cake as an economizer in fodder, can scarce believe how profitable its results are, especially during long, cold, severe winters. Owning about forty cows several years since, all of which were stabled during the winter season, the writer's attention was called to the value of cotton seed oil as an economizer of fodder, and a trial was given it, a ton or two being purchased at St. Louis and shipped to Toledo in January. Several bushels were thrown into a barrel, which was then filled with water, and when the oil-cake had become dissolved about a quart of the fluid was poured over the quantity of middlings, cut hay, or whatever fodder was given each animal at one feeding, great care being taken not to give too much, in order not to cloy the appetite—a result which follows if caution is not observed in this respect. The consequence was that the cows grew sleek, were perfectly healthy, gave more milk, and required far less food than before; a very desirable result at that time, as the winter proved a long one and feeding had to be kept up until the middle of May. So long as I continued to remain engaged in the dairy business I never again gave up the use of oil-cake, although it became difficult to obtain the cotton-seed oil-cake, and I tried linseed oil-cake, using it in the same manner, with good results, although I prefer the former, but would always use the latter when that is not obtainable. When fodder is scarce and dear the value of this experiment is great, indeed, especially in winter; and I would advise all who are engaged in the production of milk for city markets to give it a fair trial, well convinced they will not regret it. So far as regards an increase in the quantity of cream, I cannot say from experience, though it is alleged to produce cream of better quality and of increased quantity. Those who sell milk and keep cows for this purpose cannot fail to derive great benefit from the use of oil-cake in the manner above described, as it is a saving of money, while it also serves as an aid in making it.

FEEDING VALUE OF VARIOUS FOODS.

THE Tribune, in reply to an inquiry, gives some ideas about the proportionate value of corn, bran and roots, which we copy that our readers may make their own comments. The estimate of corn and bran differs from our experience—making the latter higher than we have found it:

"As the quality of roots varies considerably on account of the quality of the soil on which they may grow, and as the value of a given weight or measure of corn varies somewhat for the same reason, it is impossible to speak with perfect exactness in regard to comparative values. We can give approximations only. The values of a given weight of corn and bran, when used as cattle food, are so nearly equal that, for all practical purposes, they may be considered alike; and yet the bran costs once and a-half as much as the corn. We will compare roots with the cheaper food. If we take an average value of the different kinds of roots, mangel wurzels, rutabagas, turnips, carrots, parsneps, sugar and field beets, they will have an average theoretical value by weight equal to one-seventh of the value of corn. On account of their rapid and perfect digestion when fed to cattle, and also on account of the better use made of their nutritive properties from being intimately incorporated with a large amount of water, their practical value is one-third greater than their theoretical value as compared with dry foods. The relative value of roots and corn may therefore be set down as 5 to 1. When 60 pounds of corn are worth 40 cents, roots will be worth 8 cents for 60 pounds. When compared with bran at $1 per hundred, they will be worth one-half more, or 12 cents per bushel of 60 pounds. It would not be advisable to feed roots too exclusively. It is better to feed part roots and part grain. Nor is it advisable to feed one kind of roots only. It is better to have a variety, both on account of the health and condition of the stock, and for the better results in milk which will be produced by a variety over a single kind."

CLOSE BREEDING.

A WRITER in the Western Farm Journal, after alluding to a discussion on this subject by the Stock Breeders' Association, says:—It has been supposed destructive to good breeding to go into any of the forbidden degrees of relationship. If a neighborhood was enterprising enough to buy a fine bull, or horse, at great expense, after a certain time the animal and all his progeny must be discarded for fresh blood, which must be imported at a further increased expense, or the original improvement went for nothing and was lost. In this way, many good breeds have been frittered away and wasted, because the importations could not be kept up and maintained indefinitely. This position is nonsensical in the extreme, as any intelligent breeder ought to know.

How was it possible for Bates, or Webb, or Bakewell, or any of the original improvers of stock, to maintain the superiority of their breeds? They had no other choice strains to run to, if they had desired to do so ever so much, for there were none in existence. It is more than probable, that if there had been, they would have kept on as they did, for when they once got a choice animal, they carefully preserved all his good qualities by breeding to others possessing, as near as possible, other good points. They were compelled to do this regardless of relationship for the reasons above stated.

It is now quite certain that the only way to maintain a choice breed of stock is to keep up the intercourse between them, regardless of relationship, so long as there are any good qualities worthy of preservation. Any system of breeding which is based on any other principle, is founded on error and is sure to fail, as so many of our previous attempts at improving Western herds have failed.

HAY OR MEAL FOR COWS.

A CORRESPONDENT of the London Agricultural Gazette, traced the change of opinion with regard to hay in his own neighborhood. "Years ago the practice here was almost invariably to feed the milking cow on hay alone; then some few dairymen began to give those cows that had lately calved, two or three pounds of linseed cake per day; then some of the poor grass land on the dairy farms began to be broken up, and some mangels were grown; now the rule is often to cut up partly straw and partly hay, and mix with pulped mangels, and give each cow four or five pounds of cake or meal, or both."

SEVERAL kinds of roots should be given to supply cows with succulent food in winter. Common turnips do not keep so well as rutabagas and mangel wurtzel, and sugar beets are still better for use in late spring.

Field Crops.

CULTIVATION OF BROOM CORN.

A WRITER in the Practical Farmer gives the following plain and practical directions for the cultivation of this crop, as the result of fifteen years' experience:

Broom corn seed should be planted in the spring, about the same time as Indian corn, on ground that has been thoroughly pulverized with the harrow. Corn stubble or clover sod is one of the best places for a crop of broom corn. Let the rows be marked out, three and a half feet apart, after which sprinkle the seed in the marks as evenly as may be practicable by the hand. A better way is to use a common garden drill. Cover the seed by passing a light one-horse harrow over the ground, going twice to the row if the land is cloddy. Do not cover the seed too deep. After the spears are up about two inches high, go over the rows with a large harrow. Do not be afraid of tearing up the young plants, as the greatest mistake with most people consists in planting too thick; the stalks should be three or four inches apart in the row. Two and a half quarts of good seed will be sufficient for one acre, if the ground is in good order. By harrowing the small weeds will be killed, and the working of the soil will give the corn a start, after which the growing crop will require the same cultivating as other corn. When the stalks begin to shoot out in head, go over the field, bending down all that are out, before the tops get crooked. This operation will have to be done several times. After the seed is nearly ripe, commence cutting the brush. First cut the brush from two rows, then go back and with a corn cutter cut the stalks, laying them crosswise on the rows, so as to make a bed to keep the brush from resting on the ground; lay the brush on this bed and let it remain two or three days in the sun, after which tie the brush up in bundles, and secure in round shocks about ten or twelve bundles together. One bed will hold the brush for eight or ten rows. Cover the shocks with stalks, tent fashion, making covering tight at the top, but so that the air can pass through the bottom. In this manner the broom corn ought to stand three or four weeks until thoroughly dry, then cart to the barn and take off the seed, which may be performed by using a common threshing machine; take off the top, and, if an undershot, cross the band: have a boy to hand you the brush, as much as you can hold tightly in your hands at once, holding the seed ends on the cylinder as it revolves. In this way one man and a boy can clean several hundred pounds per day. Much depends upon the kind of soil in raising broom corn. Flat, loamy lands or river bottoms will yield the best crops. But, paying crops of broom corn can be raised on any good corn land that will yield from 700 to 1,000 pounds and 40 bushels of seed to the acre.

There are several varieties of broom corn. The improved Evergreen is much more profitable, as the brush is worth almost twice as much in the market, and the yield of seed will be larger and better than the crop of the old red variety of broom corn. SAMUEL WILSON.

Mechanicsville, Pa.

PEDIGREE WHEAT.

THE careful choosing of the best for seed is scarcely practiced in this country except for corn. In England, farmers have for years been in the habit of selecting the choicest ears of wheat for seed, and this practice has produced some remarkable results. From a paper read by Mr. MOLD before the Maidstone Eng. Farmers Club, we copy the following, which may be of interest to many American farmers:

For 13 years I have grown Hallett's pedigree wheat, and every year have had extra sized heads and yield, and so long as this continues I shall buy fresh seed each year, at £5 5s. a quarter. You see here before you my best head (11 rows on a side) in the year 1870. You see a photograph of 1871's best head (12 rows on a side), also 1873, 14 rows on a side, also two heads of 1874, with 15 rows on a side, and I have even reached 16 rows. The bunches of heads displayed are 1874 Hallett's Red, Hunter's White, and Hallett's Pedigree Golden Drop, and on my poor clay they produced 6 quarters and 7 quarters per acre. You also see a sample which has been kept in a bag since last August, and you see 105 heads growing on one root, on which more than 8,000 grains were growing at once. Now, if I had not bought new seed since 1870, I should have only 11 rows on a side instead of 15 and 16 now growing. I must here call attention to the maxim, "Sow half the usual quantities one month earlier, and expect 2 quarters per acre extra." From its great tillering power it is able to occupy double the space of ground, but it requires more time to do it, and the right time to sow wheat is when it would shed. Most of you will buy a good bull or ram, but a pedigree in corn (wheat) pays better. Professor Buckman said, in a lecture to the Dorchester Farmers' Club, "He was convinced the best seeds were as essential in securing excellence in plants as were the best stock for producing good animals." Virgil, 40 years before Christ, wrote (Georg. I.) about wheat, "Yet have I seen them degenerate, unless human industry with the hand culled out the largest every year." A wonderful record of 1,900 years ago! They knew something, but it was not the largest grain they ought to have wanted, for every head contains one grain far better than all others, and this is not the largest. This principle is the foundation of Hallett's success.

CORN RAISING.

IN the following statement everything is charged the same as though it had all been hired. All the work but the husking was done by my father and myself with one extra hand, so it did not cost us near the 34½c.:

Dr.	
To 2 days, breaking up	$12 00
1 1-5 days' spreading manure	1 50
2½ days' hauling out manure	10 62
1⅘ days' harrowing in manure	4 75
3⅕ days' planting	4 37
5½ days' cultivating and hoeing first time	7 50
6 days' cultivating and hoeing second time	8 00
5 days' cutting up	4 00
hauling in	3 00
⅘ bushel corn planted	70
1 bushel potatoes	75
1 day digging potatoes	1 00
55 loads manure, ⅕ charged this year's crops	30 00
husking	10 40
interest	10 00
Total	$108 59
Cr.	
By 20 bushels potatoes	$8 00
1 cartful pumpkins sold	2 00
7 cartfuls pumpkins given to cattle, worth	10 00
18 pumpkins sold	1 50
fodder	15 00
Total	$36 50
Cost of 208 bushels of ears of corn	$72 09

or 34½c. a bushel. I do not think that is as large a profit for the work done as we should have obtained if we had sowed the field to oats last spring and put on the manure this fall and sowed it with grass seed. Then we should have got a heavy crop of grass next year—that is, we always have—and we have tried it a number of times within a few years. Perhaps I had better say that the potatoes were planted in a wet corner, and that there was 1 3-5 acre of land by measure.—A. H. C., in *N. E. Farmer*.

THE PEERLESS POTATO.

THE Germantown Telegraph says:—"There has been a good deal said about and in favor of a rather new variety of potatoes, called the Peerless. There have been different opinions, however, expressed as to their quality, but none as to their productiveness. In some instances 350 bushels have been the yield of an acre. They are a rather round, clean tuber; and in order to test their quality we purchased our winter's supply from one of the leading Montgomery County farmers. We can now say of them that they are a *good* potato. Better than our supply of the Early Rose was last winter, but not equal to the White Peachblow. The latter, owing to their poor yield, are so scantily grown in this section that we have found it difficult the last three or four years to secure a supply. We are satisfied with the Peerless, as being next to the best Early Rose, and if we never have a worse variety we shall think ourselves lucky."

This praise of the Peerless potato is deserved when they are well grown. Most potatoes vary largely in quality, and the Peerless more so than most. Our observation has been that on only moderately rich, heavy soil the quality of this variety is superior. Where the soil is very rich the tubers are too large, coarse and ill flavored. On sandy soil, also, the quality is more apt to be inferior, and a poor Peerless is a very poor potato indeed. This variableness in quality has greatly interfered with the introduction of the Peerless as a market potato. For productiveness it ranks with the very best, yielding 200 to 400 bushels per acre with good culture.

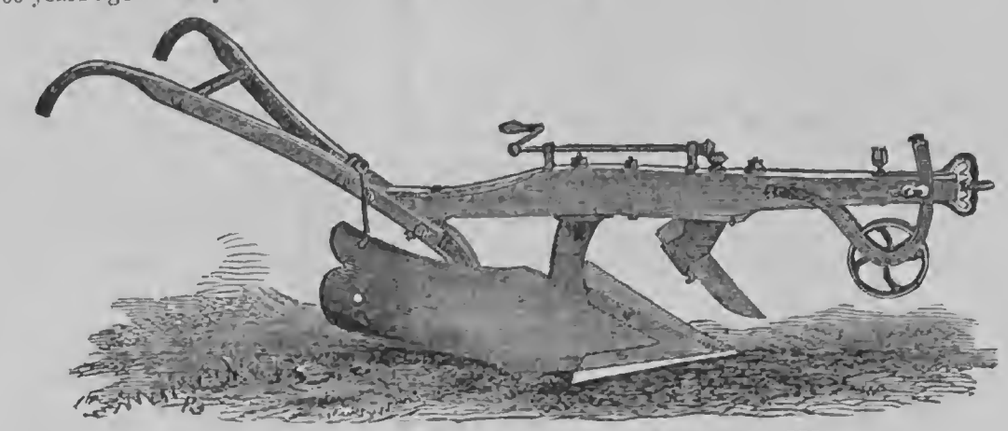
A LITTLE OF EVERYTHING.—In laying out plans for the coming season it is best to plant or sow some of all crops which can be grown successfully. In this way the failure of any one will not entail great loss, and employment may be found for all parts of the season better than by the cultivation of one specialty.

Industrial Implements.

THE HOLBROOK SWIVEL PLOW.

THE STANDARD SWIVEL PLOW OF AMERICA.

WE give this week an illustration of the celebrated Holbrook Swivel Plow, made and sold by EVERETT & SMALL of Boston. The engraving



THE HOLBROOK SWIVEL PLOW.

shows this plow as it now appears after various modifications and improvements since it was first introduced. The need for a swivel plow seems at least to have been fully met, and farmers who wish to have their fields level can do so with the certainty of making as good work in plowing as by the old-fashioned styles. From the beginning of the manufacture of swivel plows, very many farmers gave them the preference despite all imperfections. Some indeed had to do so, because their fields were too hilly for ordinary plows to work well, and the success of the Holbrook Swivel Plow has induced other farmers to demand them for use on level lands. The same cause has also stimulated the manufacturers to new efforts and to make greater improvements. Many farmers, having purchased a swivel plow for one or two fields, find it to their advantage to use it on their entire farms and will now use no other. In one plowing match, held by a New England Club last fall, other styles of plows were not admitted to enter the lists as competitors.

The Holbrook Swivel Plow was awarded the first premium at the National Swivel Plow Trial held by the N. Y. State Agricultural Society in Utica in 1870. It also won a silver medal and silver cup in the great plowing match of the Maine State Fair last fall, where it accomplished the remarkable feat of plowing on sloping land, throwing all the furrows up hill and laying them as handsomely as could have been done on a level surface.

Those of our readers who wish a good swivel plow are confidently recommended to correspond with the manufacturers of the Holbrook, Messrs. EVERETT & SMALL of Boston, Mass., whose advertisement may be found in another part of this paper.

The Poultry Yard.

DIARRHEA IN FOWLS.

F. W. BYERS, in Poultry Argus, gives the cause and cure of this disease in fowls:—This is not usually a serious complaint in adult stock, but frequently proves quite fatal in chicks. The causes in fowls that produce looseness of the bowels are usually referable to improper food and drink and when the diet is corrected the disease naturally disappears. If any medicine is to be given we would recommend prepared chalk in five grain doses with as much rhubarb, two or three times a day. The administration of one to three grains of cayenne pepper is also recommended, or if the discharges are not controlled by the above, opium and ipecacuanha one grain of each every four to six hours can hardly fail to arrest the diarrhea. But it is in the young broods that most trouble occurs, and generally within ten days or two weeks after coming off the nest. The little fellows may appear lively and eat well enough, but soon an ugly accumulation around the vent is noticed and the sick chick peeps around as if in distress. It will now be seen standing in the sun or moping around the coop looking about one-fourth shorter than its fellows and refusing its food. If it lives through the day, it is likely to be found dead in the coop next morning. We have seen whole broods die off in this way that appeared healthy when first hatched and no treatment seemed to do them much if any good. July and August are the months in which we find the disease most fatal to chicks, and while we have at times thought medicine was an advantage, no treatment has yet proved satisfactory in our hands.

We provide plenty of shade for the brood, give wholesome food and cool drinks, and let them battle for themselves. The chalk and cayenne pepper is worth trying for the little ones in smaller doses as well as for the older birds, but cannot be considered reliable. When early hatching is practiced there will be little to fear, and if from any cause our chicks must come late, we would prefer to wait until the heated term is over.

Whether contagious or not (this diarrhea of little chicks we mean) it will be found safest, or at least prudent to separate the broods so diseased. We would also advise that as soon as dead the carcass should be buried, although no careful breeder need be reminded of the necessity of pure air and cleanliness.

MANAGEMENT OF HENS.

THE Prairie Farmer gives the following advice in regard to the management of hens:

1. Never set a hen in a box above the ground or floor of the chicken-house if possible, as the eggs dry too fast and lose their vitality. If possible to set hens on the ground you will have much better success.

2. Never set more than fifteen eggs, no matter how large the hen. Some set only ten or twelve, but under ordinary fowls thirteen or fifteen will hatch as readily as a less number—though more are a waste.

3. Always be careful to mark the eggs set with the date of setting, as other hens often lay on the same nest with a setting hen, and when the brood is ready to come off, extra unhatched eggs are left in the nest, which you cannot account for, and do not know how to dispose of except by waste, not knowing when they were laid.

4. Keep a memoranda of all hens set, with dates when they should come off, that you may have coops and proper food prepared for them. Also take the young chicks from the hen as they dry, because sometimes they may run over their time a little, or hatch earlier.

5. Better let hens come off their nests for a short time for food and water, than to confine them and feed on the nest.

Two boards nailed together at one end, with slats of lath across in the form of an A, make an excellent coop.

Scientific and Useful.

INDIVIDUALISM IN PLANTS.

THAT different varieties of a genus or species of plants differ widely is well understood, and is indeed inferable from the word used. But there is also a less considered diversity in established and distinct varieties—an individualism of plant life separating it from others apparently identical, and this is generally lost sight of. It is too commonly supposed that specimens of the same variety are identical, excepting possibly in those instances where recognized "sports" are perceived. Is it not probable that this variation or tendency to "sport" pervades all plant life, only in the great majority of cases the difference is so slight as not to be noticeable? "As like as two beans" has passed into a proverb, but can any one certainly say that two beans even were ever exactly alike? To an uneducated eye there is little, if any, difference in a flock of sheep of same age and breed. But no ewe fails to find her own lamb, and an experienced shepherd will readily distinguish each member of his flock, though apparently exactly alike. In cattle, horses and some other animals these distinguishing peculiarities are easily seen by the most inexperienced; but it is every way probable that there is as distinct an individualism in animals where the peculiarities of form and structure are not noticeable as in those which are. Why not also in fruits, grains and vegetables?

The tendency of varieties to retrograde or "run out," as popularly believed, is thus explainable. If disease fastens upon a plant it affects not only itself, but its seed and the plants resultant therefrom. Any peculiarity is thus perpetuated, and at last the individual type "sports" into a distinct variety. With plants which are propagated like the potato from cuttings or eyes, the perpetuity of disease is easily explainable. There is, in fact, no new plant, but only a continuation of the old, with all its diseases and imperfections. In the seedling, no doubt, most of the characteristics of its progenitors may be found, sometimes active, but more frequently dormant, yet in either case none the less real and none the less practically important.

RAPID FILTRATION.—A simple contrivance, acting upon the same principle as Bunsen's filter, has been proposed by E. Fleischer. A wide mouthed bottle is closed with a rubber cork twice perforated; into one of the perforations the funnel is fitted, while a short glass tube, bent at a right angle, is inserted into the other, and lengthened by means of a piece of rubber tubing with spring clamp attached. The filter is capped with a small filter, then inserted and well moistened so as to rest against the funnel; afterwards the liquid to be filtered is poured upon it, and the air in the receiving bottle rarified by sucking through the rubber tubing, which is then closed by the clamp.

The Apiarian.

THE APIARY IN WINTER.

Mrs. E. S. Tupper, the noted apiarian, writes to the Am. Bee Journal as follows:

Through the month of January the bees require no care in the cellar or house. They only ask to be in darkness and quiet. If they are on their summer stands, and have quilts or carpets over their frames, they will not suffer; though the entrances are blocked with snow. It is well, however, to see that the entrance, during a thaw, does not become stopped with water and dead bees, which a sudden cold wind may convert into ice. While you have nothing to do for the bees directly in this month, it is the time to plan for another season's work and prepare your hives and honey-boxes. We hope the experience which some of you had will not be repeated this winter, viz:—Your bees die at such a rate that you will need no new hives. If you have been careful, we are sure you will not.

There is a feeling of discouragement with regard to the sale of extracted honey which we fear will lead many to remodel their hives, and try next season to secure box honey only. We say "fear," because we are sure that no such change is necessary for those who wish to secure the greatest amount of profit from their bees. We know that the extractor must be used by Western bee-keepers, in order to keep their colonies strong in numbers from May to November. We have seen, during the past year, many colonies that did well in June, but afterward stored nothing in boxes; and though the hives were full below, they had few bees, and had given their owner no profit. If these colonies had been "robbed" by the extractor of all the honey they could spare early in the season; the queen would have used the empty room; more bees would have been raised, and surplus boxes might have been filled, besides the profit from the extracted honey. The sale of extracted honey is another question. What we claim is, that it is better to take the honey from the bees, even if it had no cash value.

As to hives—those who do not care to increase their number of colonies, will find it best to have large hives containing from fifteen to twenty frames, side by side. Hives like these, well filled with bees, and with well arranged boxes and frames for honey, will give large amounts of honey in nearly every season. The comb foundations are sure to be a great help, not only in the main hive, but in the surplus boxes. Every bee-keeper can afford to have them in his boxes, and also in his main hives to secure the combs straight, as well as to save the bees time and labor.

We hope the sale of these will be large enough to reduce the price somewhat, but even at the present price, no one not well supplied with empty comb, can afford do without them. In surplus boxes, and frames for securing box-honey, they will insure the combs to be built straight, and give the bees just the inducement to work in them which is necessary.

EXPERIMENTS WITH HONEY.

A correspondent of the Scientific American gives his experiments with bees in 1874:

"I put up six one-pound cans of beautiful linden honey, being careful to make it one homogeneous mass by stirring. It was thrown from the combs by an extractor on July 20, and put into cans on August 1st. The cans were placed respectively as follows:—One in a dark, dry cellar, one each under shades of red, yellow, green and blue glass, and the sixth can in full light. On November 8th the honey in the cellar candied to a white. November 22 to December 10, honey under colored shades candied, first in the red, next in the yellow, green and blue; while the honey in full light remained transparent until January, when it soon candied after exposure to intensely cold weather. From my experience an equal temperature would preserve certain kinds of honey, while other kinds would candy under almost any circumstance. I think that candied honey, instead of being looked upon with disfavor, should be recognized as evidently pure. I hope, however, that the above experiments will lead others to follow up the light theory with beneficial results."

AMOUNT OF HONEY FROM A HIVE.

T. B. Miner in the N. Y. Sun believes that there is profit to be made in bee keeping, though objecting to rose colored pictures of the business. He says:

We often see statements in the bee papers of 100 to 200 lbs. of new honey being obtained from one hive or stock of bees; but the writers fail to say that such families are those that do not swarm; besides little reliance can be placed on what these men say, as the most of them have hives to sell. I know this to be a fact, that generally no bee keeper can obtain over 25 lbs. of box honey per hive, on an average, for a series of years.

With those who keep but a few stocks, five and upward, twenty-five pounds per stock is as much as can be relied on, and little or none from swarms. This is profitable. Suppose one has 10 hives, and has 250 pounds of honey to sell at 30 cents per pound, besides perhaps, enough left in partially filled boxes for the family use, doesn't that pay? It is over a 100 per cent. on the value of the bees, to say nothing of an occasional stock or swarm that may be sold.

It may seem strange to those who have had no experience in bee keeping, that after a certain number of families are obtained, as 100 to 500, there is no certainty of ever getting the number permanently higher from swarms, natural or artificial; but such is the result with the majority of our extensive bee keepers. They have no bees for sale, as a general rule, which tells the story plainly—they lose their annual increase by disasters of one kind and another.

SAGITTARIA.

The Garden.

THE ONION FAMILY.

There are a good many members of that respectable family so celebrated for fragrance—we mean the onion tribe. Some of them, of course, are well known and appreciated, as they are very likely to be; for they have a peculiar way of attracting attention, though they may be too modest to speak for themselves. Others are not as popular, though perhaps not unworthy of a passing notice.

The leek in many countries is quite extensively grown. In America it is found in the markets of our large cities, and in some particular sections, but generally in the country is almost unknown. The leek is very hardy, bearing a good deal of freezing when in the ground, without any injury, and therefore in climates not too severe is allowed to remain in the ground during the Winter, to be gathered as needed. This, of course makes it very desirable for many localities. In very cold climates it is taken up before winter and preserved in earth, about like celery, though not needing so much protection. The leek forms no bulb, and the thick stem, which is the part used, must be blanched by earthing up. The leek is prized for soups, and is often boiled and served as asparagus. Culture as for common onions.

Chives is a small and not very important member of the onion tribe, quite hardy everywhere, and will grow from the same bulbs and in the same spot. In old times it was the custom to make a little border of chives among the herbs. The leaves are as slender as a fine knitting needle, and appear in bunches early in the spring, and are cut and used in the raw state, and may be shorn several times during the spring. It is propagated by divisions of the root.

Shallots are somewhat similar to chives, but much larger and better, the roots being quite hardy, they are kept in the ground during the winter, and in the spring one bulb will separate into half a-dozen or more. They are then taken up, divided, and bought and sold as young onions. The shallot ripens about the middle of summer, and can then be taken up to be planted in the autumn, or retained for winter use. Some people prize shallots for pickling. If planted in the spring they do well, but are not ready for use as early as if set out in fall.

The most pungent of all the family is the garlic. It seems as if the essence of a whole bushel of onions was concentrated in one of its little bulbs. The root or bulb is composed of a dozen small bulbs called "cloves." Garlic is so much used in the south of Europe, that the American traveler at first gets the idea that everything he eats and drinks has been flavored with it. The little cloves are planted in the Spring six or eight inches apart, and in August the tops will die, when the bulbs are ready to gather. They grow the best in light rich soil.—*Vick's Floral Guide.*

LIMA BEANS.

A correspondent of the Practical Farmer gives some particulars about the raising of a large crop of Lima Beans by a Pennsylvania farmer:

The ground was a low piece which is frequently overflown from a creek close by. It was manured broadcast with stable manure and plowed in. No manure of any kind was used in the hills. Hills planted four feet apart each way, with four beans to each hill, were made on the level surface and covered one inch deep. Planted May 10, worked and kept clean with horse and cultivator; poles not put in till runners of beans were 12 to 18 inches long. No pinching process practiced, they being allowed to run at will, and made a very large growth, completely covering poles and running from one to another. When the frost came and killed the vines they were loaded down with beans quarter grown. The beans were not started in a hot-bed at all, and not soaked previous to planting.

Floricultural.

SAGITTARIA SAGITTAEFOLIA.

It is not everybody that has a lake, and so it is not everybody that can cultivate the beautiful Nymphaeas and Nelumbiums that are to small bodies of water what Roses are to the upland garden. But many have springs upon their premises and little rivulets that issue therefrom; many have low, damp places—incorrigible spots—that it is never dreamed may be converted into pleasing semi-aquatic gardens without expense and with no great amount of labor.

Our engraving represents *Sagittaria sagittaefolia* or *variabilis*, which, though common along the banks of little streams and endowed with no wondrous beauty, is yet well worth procuring for the situations above named.

The varieties which we find in this locality are, according to Prof. Gray, we should judge, *hastata*—narrow arrowed-shaped leaves—and *augustifolia*, narrower leaves and more divergent lobes. The flowers are correctly represented in the engraving, of natural size, borne in racemes upon scapes about one foot high. They are in color white and in substance perishable.

The flowers of *Sagittaria* are diclinous. When monoecious, the females form the lower whorl—the males above as in the engraving. But we have seen flowers of the narrow-leaved variety that were all male—a characteristic that according to the same authority, belongs only to a broad leaved variety named *obtusa*.

The engraving shows the fresh-looking, smooth, tidy leaves about one-fourth the natural size and, elevated upon long, curving petioles, the general appearance of the plant is not unlike that of the dwarf Calla Lily.

FLORICULTNRAL NOTES.

Ozone generated by Plants and Flowers.—One of the most important of the late discoveries in chemistry is that *ozone* is generated in immense quantities by all plants and flowers possessing green leaves and aromatic odors as, for instance, Hyacinths, Heliotrope, Mint, Lavender and the like. "So powerful is this great atmospheric purifier" says the Sanitary Record, "that it is the belief of chemists that whole districts can be redeemed from the deadly malaria which infects them, by simply covering them with aromatic vegetation. Every little flower pot, therefore, is not merely a thing of beauty while it lasts, but has a direct and beneficial influence upon the health of the neighborhood in which it is found."

Novelties.—The Gardeners' Chronicle says that Mr. Wills has succeeded in raising a batch of seedling *Dracaenas* that throw most of the varieties at present cultivated into the shade. These seedlings may be numbered by hundreds, and the effect of the group filling the center of a long span-roofed house, is "startling." It seems he does not propose "to pour such a flood of novelty into the market" at one time, but determines "to send out but a limited number"—so that we may expect, from this source alone—new *Dracaenas* for many a season to come.

Chinese Primrose—Mrs. P. Caldwell.—Sow in May and keep in shade or frames during summer. They should bloom next winter and spring. Planted out in a shady place, they will continue to bloom during a part of the summer. But it is better to have fresh plants for another winter.

The Vineyard.

CHEAPLY MANAGED GRAPERY.

Mr. James Dougall of Windsor, Ont., a nurseryman of long experience, gave the following account of his cold grapery before the Ontario Fruit Growers' Association. It is so constructed that most of the labor of watering and ventilating is obviated.

By adopting the following plan in erecting the vinery they will be relieved of the greater part of this trouble and have a fine supply of delicious grapes, with no more trouble or attention than is required to grow the natural vine out of doors.

The sashes are made stationary but so that they can be unscrewed and taken off for repairs any time. They extend from the front wall to within a foot or ten inches of the back wall at the top, leaving an opening of ten inches wide along the top to be closed by sheet iron ventilators in winter or when requisite, but which are kept constantly open from the time the vines are uncovered in the spring till they are laid down and covered in the fall.

The principal peculiarity is in the glazing. The glass is laid end to end without lapping or putty, and merely kept in its place by small pieces of tin, and a space of half an inch is left open between every third or fourth pane, so that all the rain that falls on the house is distributed pretty equally over the entire house, very little running off the house except in very heavy thunder storms. There is no ventilation whatever below, as a draught I have found injurious to the vines. Any air that comes in is by these openings in the glazing, and the heated air finds vent at the top.

Last year was a very dry one as well as this, we had no rain here for months, but the vines never suffered from drouth, though they were never watered or syringed from the time they were uncovered in the spring, when it was done copiously, till again uncovered this spring. Nor were they the least affected either last year or this with mildew or red spiders, though previous to adopting this rule I was annually troubled with both, in spite of syringing copiously morning and evening.

The ends of my present vinery are not glazed, having only a small window and door on each end. Were I to erect a new one I would have the ends glazed to within three feet of the ground, and would have openings in the front wall to allow the roots of the front row of vines to extend into a prepared border outside.

For those who may wish to try this plan I would recommend the following varieties as being the most successful with me, and of the finest quality.

1, Black Hamburg; 2. Muscat Hamburg; 3, Champion Hamburg; 4 Lady Downes; 5, Golden Hamburg; 6, Bowood Muscat; 7, Buckland Sweet Water; 8, General de la Marmora

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near NeW York City.

MORE ADVICE WANTED.

DEAR RURAL: -Your "Gentleman near New York City" is guilty of inducing me to come to Kansas. His notes on a trip to Colorado and this State were the impetus that drove my unmoored bark here. Your paper, also, is the influence that changed my course of life from merchandise to farming. So you can realize that you have a farther duty to perform toward me. Our county is all prairie, and I want to see some trees. Formerly, in Michigan, my desire was to have them cut down and burned up. Please have the "Gentleman near New York" answer the following:

1. What trees are best suited to our Western high, dry, windy prairies?

2. State what kinds are best propagated by cuttings and what by seeds.

3. Where can I obtain cuttings and seeds, and what season of the year is best to propagate?

4. How shall I cultivate the cuttings—in beds, or where I wish the trees to stand?

Farmers in this part of Kansas are now busy plowing, harrowing and sowing spring wheat. We are determined to have our crop early, and, if possible, cheat the grasshopper.

Rice Co., Kansas. JAS. S. BEATTY.

Feb. 21.—What I may have said in the notes of travel referred to by the writer of the above which should have led him to change his residence is a puzzle to me at this time. But as my accuser does not complain of his lot, I must presume he is content, only desiring to improve his surroundings and accumulate those pleasant adjuncts so necessary to a home, wherever it may be located. In answer to the questions asked, I can only say what *I think* I would do if placed under the same circumstances.

"Those "high, dry, windy prairies" are anything but congenial to trees or shrubs, else Nature would have long ago covered them with forests; hence we have a powerful enemy to contend with at the outset. An uncongenial climate is far worse than an uncongenial soil, for the latter can, in a great measure, be changed and adapted to our wants and desires; but man's influence upon the former is very circumscribed, however powerful his efforts at cultivation.

Looking at the question in this light, a man must be content to make haste slowly, accepting of what he can keep, instead of seeking kinds which are not adapted to his soil and surroundings. Then, again, a man should keep in view the fact that there is a prospect of constant progress from the inferior kinds upward, the hardy old scrag which first takes root becoming a protector to something better; and it is upon this plan that the settlers in the most exposed localities of the plains must proceed in order to succeed in surrounding their homes with trees and other useful and ornamental plants.

BANKING AGAINST WINDS.

Success in starting a grove or plantation of trees upon the higher and drier prairies depends very much upon the arrangement pursued in the beginning, and the proper course would be to adopt what I shall term the "Banking system"—that is, plant low-growing shrubs on the outer edge of the proposed forest or grove, on the side from which the prevailing winds generally come. Next to these, plant those of a taller growth, and so on until the taller kinds can be introduced, thereby forming a gradual, elevated bank or wind-break for the most valuable kinds. This bank or wind-break may, of course, be made with one kind of tree by heading back the first row or two, low, allowing the branches to start from the ground; then trim up but slightly the next row, and so on; for some arrangement of the kind is positively necessary in order to secure a protection from the winds which constantly sweep over the higher plains of Kansas and Nebraska. The truth of this assertion may be seen in the unprotected plantations already started in various parts of the States named. The "lean-to-the-east" position of most of the trees planted on the plains certainly shows "which way the wind blows" and what is required to help matters in "uprightness."

WHAT KINDS TO PLANT.

There is a great diversity of opinion on this point, but trees with small foliage will usually not only offer less resistance to winds, as well as suffer less from drouths, than those with broad, large leaves, such as the hickories, magnolias and maples, although the latter may be introduced on the inner rows if the banking system is adopted. The honey locust, beech and small-growing species of wild cherries and plums are excellent for the windward side of groves, allowing them to form in dense masses, unpruned and uncared for, after the plants have become well-established. There are also various species of willow which may be used for the same purpose, for their roots strike deeply into the soil and the branches are sufficiently flexible to prevent any considerable injury from the wind. The white and yellow willow and the laurel-leaved, as it is generally called in the nurseries, are excellent for this purpose. Cuttings can, of course, be had very cheaply, and they grow readily; but in a very dry soil and climate it may be necessary to mulch the soil or apply water during the first season.

Next to the sugar, silver and negundo maple may come in for a goodly share of attention, as they are of rapid growth, withstand drouth as well as most native kinds, and are both handsome and valuable. The young seedlings of these kinds can be obtained in almost any Western nursery as well as Eastern, and so cheaply ($3@ 5 ₱ 1,000) that I would not advise any novice in fruit tree culture to attempt to raise them from seed, especially on the plains. Cottonwood is also a valuable tree on account of its rapid growth, and a man could scarcely do better than to plant a quantity as a *dernier* resort for wood, and then throw them out after superior and slower growing kinds had become available. Cuttings of cottonwood or young trees can, of course, be had very cheap and in any quantities in the nurseries near home. After a man has his wind-breaks well started he may begin to think of evergreens, fruit and other kinds of trees, but until this is done there is not much chance of success on high, dry prairies. Seedling apples, pears, plums and cherries, could, of course, be used instead of forest trees for planting in thickets and some fruit obtained from the trees in due time, with a possibility of producing new varieties adapted to the climate if nothing more.

(2.) This question has already been answered in the above.

(3.) Always apply to the most reliable seedmen for seeds and to a nurseryman for trees, giving peddlers a "wide berth." Spring would probably be the best time to plant on the prairie and as early as the ground will permit.

(4.) Cuttings should be kept in beds, and cultivated there for a year or two before planting in their final position. It is not too late for procuring seedling trees this spring; although plowing and sowing may be going on in some portions of Kansas, vegetation has not started in many other localities from whence such things may be obtained.

The principal reason why the farmers on the prairies make such slow progress in tree planting is this, dilatoriness in making a beginning. They keep putting it off, thinking, perhaps, that next year will answer just as well as this, and so it goes until they get accustomed to their dreary surroundings. When a man can purchase a thousand seedling forest trees for from three to five dollars, he cannot urge the cost as a reasonable excuse, unless he was as poor as the Irishman who could not buy one brick of a block of buildings offered him for a dollar.

Our nurserymen, knowing the actual needs and wants of those on the prairies, raise immense quantities of seedlings to meet them, hence the most suitable kinds can always be obtained at a very low figure, in fact for less than a man can raise such stock himself in small lots of a few hundreds or thousands. The cost of transportation is also but a trifle on such small plants, considering the number that can be packed in a box a few feet square. Neighbors should club together in sending their orders to the nurseries, thereby enabling them to obtain stock at wholesale rates, and then, by dividing up, each can secure a good variety.

Arboricultural.

PRUNING OLD FRUIT TREES.

"ABOUT this time we may expect" to hear the ax and saw among the old fruit trees. Sometimes their owners prune just because they have been in the habit of doing so at this season, while others do it to produce certain beneficial results. But we are inclined to think that a majority of our farmers have no particular object in view when performing this operation, and our reasons for thinking so is the manner in which the pruning is done. If the trees are very old, and have become stunted through long years of usefulness in producing heavy crops of fruit, they usually show it in the scraggy branches, numerous small undeveloped fruit spurs as well as the absence of good, healthy terminal shoots of the preceding years' growth. If there is still life and vigor in the old stems and roots, it is generally shown in many a young shoot springing from near the base of the larger branches, which are usually termed "water sprouts" or shoots. Now these water shoots, springing from the parts named, are reliable indications of a vigorous tree, no matter how much decay may be found about the main stems, even if it is but a hollow shell, there must be healthy roots to produce a vigorous growth of "water shoots."

A slight examination of the successive annual rings of the branches above the point from which the water-shoots sprung, will show that there has been a constant lessening in deposition of wood for several years previous to their appearance, until at last the outlet for an upward flow of sap was cut off or so impeded that it forced out new shoots from the base of their old and feeble branches. It may be asked why did not the leaves on those bearing branches draw to themselves and assimilate this crude sap in sufficient quantities to keep up a vigorous growth and return enough for forming a liberal annual layer of cambium as they did while the tree was young. A still closer examination of the old branches will show why this does not and cannot occur. As the tree grows old and the leaves multiply in number, they become proportionally smaller and less active in assimilation, besides the fruit takes up the greater part of the sap which assimilated by them, leaving a very minute quantity to pass downward and form cambium, or a new layer of wood. This disposition of the assimilated sap accounts for the well-known fact that trees bearing heavy crops of fruit produce very little young wood during what is termed the fruiting season. If what is called the circulation of the sap could be continued through the old wood or heart of the stem or branches, then we should see less of this gradual decline in growth as the trees increase in fruitfulness, and as the sap only finds a passage through the young cells of newly formed wood it becomes important that such channels should be provided.

Taking this view of the subject, which we believe to be a correct one, it may be readily seen that the usual mode of pruning old trees, that is, cutting off old branches entire and removing all water-shoots on very old specimens, is all wrong. We would not, of course, encourage the production of water-shoots in the center of moderately young trees, for these take to themselves that which is needed in the bearing branches, but their appearance, as we have said, is indicative of a stoppage of the channels which should conduct the crude sap further on.

The proper method of renovating old fruit trees is to first apply stimulating manure to the soil, then, instead of "pruning up," commence at the top and "head down," shorten all the old branches one-half to two-thirds of their original length. Thin out the central branches if they are likely to become crowded, and, during the summer, break out from time to time all surplus sprouts, leaving only those which will be required to give the head of the tree the requisite shape. The wounds made in cutting off large branches should be covered with some kind of a solution which will keep out the water and prevent decay. Common grafting wax applied hot is as good as anything known for this purpose, but ordinary mineral paint may be used instead without danger of injury to the tree. When the old stems are partially dead the rotten wood may be removed and the sound parts underneath painted over to prevent further decay. The coarse bark should also be scraped off from the stem and larger branches, after which an application of soft soap or whitewash may be applied with benefit.

The renovation of old fruit trees may frequently be attended with better results than planting out of new, especially of choice varieties known to be adapted to the locality.

FRUIT TWIG BLIGHT.

THE "newly observed" apple tree pest noticed in RURAL of Dec. 8th, from the pen of S. J. PARKER of Ithaca, made its first (?) appearance in this locality this year.

The twig blight acted nearly the same as described in above RURAL. One orchard of four acres was nearly one "forest bloom," yet it yielded but ten bushels of apples.

It differs from pear blight, in the fact that a twig without fruit is never blighted, whereas pear blight attacks any twig or shoot, or tree that does not bear fruit as well as fruetiferous twigs.

The blight has descended down the branches of some old trees two or three feet. Young trees withstand it the best, although they were attacked the worst. Very probably it is caused by a fungoid disease, as the irregularities of the spring were very favorable for its promotion.

The badness of the weather of any season is indicated by the mildewing of the Oporto grape—the only grape that mildews about here. Some years it does not mildew, but this year it mildewed very badly, even the terminal shoots and tendrils which projected far out from the vine and had free circulation of air, were covered with fungus.

This fruit twig blight of the apple tree is a very serious thing to fruit growers, if it continues, but likely it is not the work of an insect and may not reappear next year.

Clyde, N. Y. W. S. W.

Pomological.

NORTHERN SPYS AS POOR KEEPERS.

A WRITER in the Mass. Ploughman notes a remarkable variation in the keeping quality of Northern Spy apples, which he accounts for as follows:

The Spy is a very good winter apple and a good keeper, and yet a complaint is entered against it for not keeping. The trouble is here as it is with a case of Rhode Island Greening trees close to me. These apples rot on the trees during the summer and autumn, and none will keep until January first. Another orchard produces apples that will keep until late in the spring. There is a cause for this great difference in keeping qualities. I was so curious to solve the mystery that, at some trouble of time and expense, I learned that our poor keepers were raised by a man who grafted upon a very early stock, and upon trees that had become stunted. The graft partook of the parent stock, and produced an autumn apple only. The other case made a splendid keeper by having a better stock to draw from. Cannot the same thing occur in regard to the Spys. We think very likely it should. We have been advised not to plant a Northern Spy tree for this reason. We have seen trees in the vicinity of Providence with this very failing. We have seen others that produced a beautiful keeper."

A difference in soils and location will often make a great difference in keeping qualities. On light, sandy soil, apples of the same variety will mature and decay much earlier than on a soil that is cold and heavy. With regard to the Greenings referred to it may be suggested that there are several varieties of Greenings differing little in appearance but much in time of ripening. Possibly the two orchards spoken of may belong to different varieties of Greenings—possibly also there may be two families of Northern Spy apples, though this is a mere suggestion without any evidence to support it.

The codling moth causes premature ripening and decay in the fruit on which its larvæ works. An orchard kept free from this pest, other things being equal, will produce fruit of fine flavor, and especially of better keeping qualities, than orchards where nearly every apple is more or less worm eaten. We do not say that the theory offered by the writer in the extract above quoted is untrue, but only that it is not proven by the instances he cites, unless it is shown that other causes may not have produced the same result. The subject is well worthy of a careful investigation by fruit growers.

APPLES FOR THE WEST.

IN going westward it is often found that varieties of fruit which are standards in the East are wholly unsuited, and names, which to Eastern pomologists are scarce known, rank highest for the Western planter. Mr. O. H. LEAK of Hannibal, Mo., gives his opinions as to the best apples for profit in that section. He says:

"After twenty-six years of experience in growing apples for market and testing *one hundred and thirty varieties* of the leading sorts recommended in the *books*, I have received more money from three varieties, viz: Winesap, Genitou (Rawle's Janet) and Willow Twig, than from all the other varieties combined. The Ben Davis has proven more valuable than either of the three varieties above named, but it was not known here when I put out my first orchard of forty acres, I was the pioneer in planting improved fruit for market in this part of the country; had no experience in fruit growing, and worse than all, my neighbors knew no more than I did; we all thought that the man who had the greatest number of varieties had the best orchard. We all made the same mistake. If I had set out the three varieties first named, it would have been a success. The Genitous have been gradually failing for a number of years, the trees decay early, overbear alternate years, and consequently the fruit is very small; it is now discarded. The Willow Twig has not been a complete success with me, yet it is a success all around me. The Wine Sap has failed *once in twenty-six years;* the tree is very hardy—the fruit is rather small, but it bears handling better than any other sort. The Ben Davis is a perfect success all over the West. The tree is hardy, a good grower, bears young, and is full every year. Its fruit is very attractive in appearance, and sells from fifteen to twenty-five per cent. higher than any other variety—the grower does not have to hunt buyers, *they hunt him.* I am removing my old orchard at the rate of 200 trees yearly, and will in the future plant nothing but Ben Davis. I will also set them between my old trees, as they (the old ones) will be gone by the time the young trees begin to bear.

"If all the apple trees within marketable distance of Hannibal were Ben Davis, they would bring half a million of dollars annually into the County, as we are in the center of the finest fruit growing region in the West."

Patrons of Husbandry.

AMERICAN GRANGES AND BRITISH FARMERS.

THE Farmer of London (Eng.), of Feb. 7, has the following comments on the proposed introduction of the Order of the Patrons of Husbandry in that country:

Those who have dreaded England being Americanized ought to quake at the news we have to give them to-day. British farmers are about to be waited upon by one of the chief originators of the American Granges, and will be asked to form associations which shall have fraternal relations with those in America. At a late meeting of the National Grange of the United States the subject of introducing the organization to British farmers was discussed, and the Master was authorized to appoint deputies to carry out the project. He appointed Mr. J. W. A. Wright of Fresno Co., Cal., as the first deputy to carry the gospel of the Patrons of Husbandry to England. Mr. Wright sailed some time since and has gone on the Continent for a short time, but should be here in a few days. He is personally about the best man the Master could have chosen for the purpose. He is a Princeton graduate, and a practical and scientific horticulturist and botanist. He was one of the most prominent leaders in the Grange movement on the Pacific Slope, and has passed almost all grades of the Order. We have reason to know that persons professing to act in the interests of English agriculture are in communication with the American Granges and with Mr. Wright. Of this we may have more to say by-and-by. It should be remembered that the Order of the Patrons of Industry, as established in America, is at once a secret Society, after the style of Freemasonry, and a Trades' Union, of a fashion different from those which we know in England. American Patrons have built ships, made agricultural implements, and fought railway kings and rings. Not only in the rapidity of their development, but in the strength and adaptability of their organization, are they a marvel to English farmers. We will not attempt to anticipate what Mr. Wright, as the deputy of the Granges, may have to propose when he comes here. We shall, of course, be glad to meet him, and may help to show him the difference between the farmers of the Pacific Slope and many of the farmers of English counties.

AMENDMENTS TO THE NAT'L GRANGE.

AT the last meeting of the National Grange fourteen amendments were proposed and submitted to the State Granges for ratification. Twenty-eight States and Territories ratifying would secure the adoption of an amendment, or ten States could reject it. No one of the amendments has yet been adopted. The action thus far has been as follows:

The first amendment has been ratified by 26 States; the second by 23; the third by 24; the fourth by 25; the fifth by 26; the sixth by 26; the seventh by 25; the eighth by 20; the ninth by 21; the tenth by 25; the eleventh by 17; the twelfth by 22; the thirteenth by 26; and the fourteenth by 25 States.

The eighth and eleventh seem to have been the most unpopular. The former requires meetings of State Granges to be held biennially instead of annually, as now required; the latter left to the State Granges the right to fix the amount of dues for membership. This one, if any, will be rejected.

GRANGE NEWS AND NOTES.

WEST VIRGINIA has 310 Granges.

THE Order is growing most rapidly of late in the South and Southwest. In some of the Northwestern States nearly every farmer is a Patron.

THE New Jersey State Grange, in a recent session at Camden, adopted a protest against excessive railroad freights, especially on fruits and perishable articles, and asked for legislation to remedy the matter.

THE Florida State Grange invites immigration to her luxuriant orange groves and healthy climate, and points with pride to the best variety of luscious fruits in the United States territory, with sugar lands rivaling those of Cuba.

THE California State Grange says that the Order has saved seven millions to her people, and that the future will show still greater results for their good, and reports a steady progress in every department of agricultural productions, with great improvement in the manner of farming.

MASTER BUCKHAM of Iowa State Grange recently wrote Col. Smedley, Lecturer of the National Grange, that the subordinate Granges of Iowa had almost without exception paid their dues to the State Grange up to Jan. 1, and the Order never had been so prosperous in Iowa as it was then. This is very encouraging, and very different from the reports circulated by the enemies of the Order.

FIFTEEN Pomona Granges were organized in Iowa last year, and every Grange in those counties in which they were organized gained largely in membership and interest in the Grange work. Pomona Granges will help the weak Granges and enable the Granges of each county to start co-operative stores, consolidate orders for flour, machinery, etc., have lectures from prominent speakers, and aid very materially in the social and educational features of the Order.

BRO. O. H. KELLEY, Secretary of the National Grange, writes:—"There appears to be new animation in the Order. One hundred and fifty to two hundred Granges are organized each month, although it would seem that the territory was all occupied. Large numbers are uniting with the old Granges in the West, and there seems to be a revival going on everywhere among the Granges. There are calls for new Granges in many places, and an increased number of applications for membership. Pomona Granges are forming everywhere and co-operative stores contemplated at many leading distributing points throughout the country.

Domestic Economy.

PATENT CRUSHED-BARLEY.

JULIA COLMAN contributes the following interesting facts and new recipes to Science of Health:

MR. SCHUMACHER of Akron, Ohio, has given us a new article in the cereal line, which is really quite valuable. We believe the value of barley, as an article of food, has long been known, and is generally conceded. The great objection to it was the long time which its usual form, pearl-barley, required to cook. It was a favorite for soups; but even there the much less nutritious rice often took its place, because it could be much more quickly cooked. The split pearl-barley, graded, 000 and 0000, was a great improvement in that respect, but the "crushed-barley" is better yet; it is just what its name indicates, the pearl-barley crushed. It is a beautiful article, and it can be cooked in half an hour as thoroughly as the old pearl-barley can in four hours. Some will prefer to cook it a little longer, if they have time, and I would advise them to do so, say from forty minutes to an hour. Somewhere I have seen the statement that Mr. Schumacher sends a sample free to any one that asks for it; but I do not know how long that offer lasts. I think, however, it would be safe to ask it, especially if you tell him where you saw the statement. For my own part I mean to keep it on hand as a part of my stock. I have had much pleasure in experimenting with it, and here are some of the results:

Crushed-Barley Mush.—Add one part crushed-barley to three parts boiling water, and boil in a double-boiler half or three-fourths of an hour. Serve in saucers, and while warm sprinkle over it a little sugar; or eat with milk or with stewed fruits, especially whortleberries. The double-boiler may be a covered tin-pail or an old fruit-can, with the top melted off, set into a boiler of water. Any one who has tried this way of cooking the grains will be almost sure to continue its use.

Griddle-Cakes.—One cup porridge, one and a-half cups water, and one and a-half cups barley-meal or Graham flour. Mix well and bake a good brown; let them stand ten minutes to steam, and eat with "C" oatmeal porridge.

Short-Cake.—One cup porridge, one cup water, and one and a-half cups barley meal or wheat-meal (Graham flour). Make into a cake not more than half an inch thick and bake fifteen or twenty minutes in a hot oven.

Fruit-Mush, or Porridge.—To either of the above, add one-fourth as much dried fruit—currants, whortleberries or raspberries—as there was this barley, and cook them until quite tender, makes a nice dessert.

Porridge.—Add one part barley to five or six parts water, according to the taste. This is more like soup and can be eaten with bread.

DRIED POTATOES.

THE following description of the manner of manufacture of "dried potatoes" is given in a German journal as conducted at Carsten's works in Lubeck:—The potatoes are peeled with the hand, and cut into disks by a machine. These are put in a basket, and this in a boiler, where the potatoes are nearly but not quite boiled. The disks are next put on wire frames in a dry oven, where they are dried quite hard. It is important to preserve the color of the potatoes, and to prevent their turning gray, as they would by the above process alone, the material after slicing is treated with cold water, to which has been added one per cent. of sulphuric acid, or one to two per cent. of muriatic acid. Then it is washed in pure water and the drying proceeds. The preparation obtained, which has lost none of its starch, is of a slightly citron-yellow tint, and transparent like gum. Boiled with water and a little salt, it is said to resume the natural color and fibrous structure of potatoes, and is not distinguishable in taste from newly-boiled potatoes.

SELECTED RECIPES.

Italian Cream.—Put the juice of one lemon and the rind of two to one quart of thick cream. Sweeten with a half pound of sugar, and let it stand for half an hour. Add one ounce of isinglass dissolved in half a pint of water till perfectly smooth and free from lumps. Strain the whole mixture through a fine sieve, and then beat together for several minutes. Then put into a mold or molds; and when cold and perfectly set turn out upon a dessert dish.

Stewed Winter Squash (BOSTON MARROW).—Cut the squash into convenient pieces, pare neatly, put into a closely-covered kettle and stew down, being very careful at the last not to burn. Mash and stew down as dry as you choose, precisely like pumpkin. This will be found far sweeter than when stewed and the water poured off after the usual fashion, also sweeter and drier than when steamed. Serve warm or cold or make into pies.

Cracked Wheat Pudding.—Take one quart of unskimmed milk, add to it one gill of cracked wheat, uncooked, and one gill of sugar and a small piece of stick cinnamon. Place it in an oven of medium heat. When about half done stir in the crust already formed, and leave it to form another, which will be sufficiently brown. Try when it is done by tasting a grain of wheat, which must be very soft. This, when cold, makes a delicious cream pudding.

Stewed Beets.—Pare the beets thinly, and cut in thin slices across; cut up some onions, and put all together in a stew pan, with a little pepper and salt; rub a bit of butter in flour and stir it smooth in hot water; pour this over the beets (it must cover them well) and let it stew until the beet it quite tender. The older the beet the longer time it will require. When quite young one hour will be sufficient. Serve hot.

Gelatine Apples.—Peel and core your apples and cut them in halves; put in a kettle with a pint of water, sugar, sliced lemon, and green ginger, a little whole mace, and six whole cloves; boil until they are tender; then remove the apples, and put into the syrup one tablespoon of gelatine, and allow it to boil down about three minutes, then pour the syrup over the apples.

Saratoga Fried Potatoes.—Wash the potatoes clean, slice with a potato slicer very thin, throw into cold water long enough to take out some of the starch, then wipe dry and put into boiling lard a few pieces at a time. Be sure and keep the lard boiling. As soon as the potatoes are of a clear, golden brown, skim them out, drain them in a colander or sieve, and serve hot.

Pumpkin Short-Cake.—One cup stewed and strained pumpkin or squash, one cup "C" oatmeal porridge, and one cup water. Beat these up together, and then add three cups fine Graham flour. Mix thoroughly, spread half an inch thick on a baking tin, and bake half an hour in a good oven. Cover for ten minutes, and serve warm or cold.

Bread Balls.—Break the bread in small pieces, and moisten with milk or a little warm water, season with salt, pepper and nutmeg, adding a little fine sage or parsley and a small piece of butter, mix and form into small cakes or balls; roast with beef or chickens, or fry after meat in a skillet.

Lemon Pie.—Take the juice and grated rind of one lemon, one cup of sugar, yolks of two eggs, three tablespoonfuls of flour, one pint of milk; after baking cover with a soft frosting made from the whites of two eggs and four tablespoonfuls of sugar, and brown slightly.

German Potatoes.—Mashed potatoes well seasoned and plenty of cream. Make in little cakes an inch thick, (made some hours beforehand they are better), beat an egg and dip them in it; brown nicely on both sides.

Indian Rusk,—Two light cups of Indian meal, one cup of flour, one teaspoonful of saleratus, enough sour or buttermilk to dissolve, one cup of sweet milk; stir in three-fourths of a cup of molasses.

Sago Pudding.—2 large spoonfuls of sago boiled in one quart of milk, the peel of a lemon, little nutmeg; when cool add 4 eggs; little salt. Bake about one hour and a-half. Eat with sugar and cream.

Quick Pudding.—1 egg, 1 cup of sugar, 1 tablespoonful of melted butter, 1 cup of sweet milk, half a teaspoonful of soda, 3 cups of flour. Bake half an hour or more. Eat with sweet sauce.

Pancakes.—1 egg, 2 spoonfuls of sugar, 1 cup of sweet milk, 1 teaspoonful of soda, 2 teaspoonfuls of cream-tartar, 3 cups of flour.

Hygienic Information.

BAD EFFECTS OF BEER-DRINKING.

THE worst results from accidents in the London hospitals are said to be draymen. Though they are apparently models of health and strength, yet if one of them receives a serious injury it is nearly always necessary to amputate in order to give him the most distant chance of life. The draymen have the unlimited privilege of the brewery cellar. Sir Astley Cooper was once called to a drayman, who was a powerful, fresh-colored, healthy-looking man, and had suffered an injury in his finger from a small splinter of a stave. The wound, though trifling, suppurated. He opened the small abscess with his lancet. He found, on retiring, he had left his lancet. Returning for it, he found the man in a dying condition. The man died in a short time. Dr. Gordon says, "The moment beer-drinkers are attacked with acute diseases, they are not able to bear depletion, and die." Dr. Edward says of beer-drinkers, "Their diseases are always of a dangerous character, and in case of accident they can never undergo even the most trifling operation with the security of the temperate. They almost invariably die under it." Dr. Buchan says, "Malt liquors render the blood sizy and unfit for circulation; hence proceed obstructions and inflammation of the lungs. There are few great beer-drinkers who are not phthisical, brought on by the glutinous and indigestible nature of ale and porter. * * * * These liquors inflame the blood and tear the tender vessels of the lungs to pieces." Dr. Maxon says, "Intoxicating drinks, whether taken in the form of fermented or distilled liquors, are a very frequent predisposing cause of disease." The hospitals of New York show an equally unfavorable record of the intemperate, and private practitioners everywhere have the same experience.—*Sanitarian for January.*

FRECKLES—THEIR CURE.

FRECKLES are not easily washed out of those who have a florid complexion and are much in the sunshine; but the following washes are not only harmless but very much the best of any we know.—Grate horse-radish fine, let it stand a few hours in buttermilk, strain and use the wash night and morning. Or squeeze the juice of a lemon in a goblet of water and use the same way. Most of the remedies for freckles are poisonous, and cannot be used with safety. Freckles indicate a defective digestion, and consist in deposits of carbonaceous or fatty matter beneath the scarf skin. The diet should be attended to, and should be of such a nature that the bowels and kidneys will do their duty. Daily bathing with much friction should not be neglected, and the Turkish bath taken occasionally, if it is convenient.

HYGIENIC NOTES.

To Avoid Sleeplessness.—If you wish to sleep well, eat sparingly of early suppers. Avoid all arguments or contested subjects near night as these are likely to have a bad effect upon one who is troubled with sleeplessness at night. Avoid having too much company. Many persons become so excited with the meeting of friends that sleep departs for a time. There is probably nothing better, after cultivating a tranquil mind, than exercise in the open air. By observing these simple rules, sleeplessness, in the majority of instances, may be wholly cured.

Rusty Nails.—Every little while we read of one who has stuck a rusty nail in his foot or some other portion of his person, and lockjaw has resulted therefrom. All such wounds can be healed without any fatal consequences following them. The remedy is simple:—It is only to smoke such wound, or any wound or bruise that is inflamed, with burning wool or woolen cloth. Twenty minutes in the smoke of wool will take the pain out of the worst case of inflammation we ever saw arising from a wound.

Heart Disease.—To the question, whether there is anything that will cure heart disease, the Science of Health answers:—It can be cured, in its early stage, by the adoption of a rigidly hygienic regimen. In its later stages, it is incurable. But nine-tenths of the cases of supposed heart disease are merely derangements of the digestive organs, producing palpitation, throbbing, intermissions, and other forms of abnormal pulsation.

Weak Nerves.—The Science of Health gives the following directions for the treatment of weak nerves:—You must conform to the habits of hygiene, eating food which contributes those elements necessary for the building up and invigoration of bone, muscle and nerve, and avoid all heating or stimulating preparations of food.

Cure for Burns.—Charcoal has been discovered to be a sure cure for burns. By laying a piece of cold charcoal upon the burn the pain subsides immediately. By leaving the charcoal on one hour the wound is healed, as has been demonstrated on several occasions.

"PROGRESS AND IMPROVEMENT."

SATURDAY, MARCH 4, 1876.

SPRING AGAIN!

AN "OPENING" FOR ALL RURALISTS.

MARCH, the first month of the vernal season, usually inaugurates active operations in all branches of soil culture throughout a large portion of our country. The hibernating period having passed the great laboratory of Nature is again in full force, affecting favorably the earth, air, and animal and vegetable life. Though the past winter has not been severe, the opening of Spring must be cordially welcomed by all lovers of nature, and especially by the large portion of our population engaged in rural pursuits. The season is one of hope and rejoicing alike to the Northern farmer, the Southern planter, the Western and Southwestern ranchman, and also to horticulturists, gardeners and florists throughout the land. Indeed, March brings a "Spring Opening" to all Ruralists in the temperate and frigid regions of our Continent, from Canada to California and Maine to Minnesota, and far beyond.

The active campaign will soon open in garden, orchard, field—indeed in all out-door labors connected with the cultivation of the earth—and it behooves every one interested to prepare for a successful prosecution of the necessary operations attending soil tillage and production. Foresight and good management are requisite in spring to insure a proper return and profitable results in Autumn. The wisest course is for each to decide in advance, so far as situation and circumstances permit, as to the course best to pursue—what crops or specialties to adopt—and then devote his energies to secure success in whatever is determined upon. A season's campaign judiciously opened, and continued with diligence, intelligent direction and confidence, can scarcely prove a failure—for so long as the promised seed time and harvest are vouchsafed the industrious and persevering husbandman will be rewarded.

Wishing all engaged in Agriculture and kindred pursuits a hearty God-speed on the opening of spring, the RURAL NEW-YORKER pledges its best efforts to aid its myriad readers, so far as in its power, in their various operations. While it seeks to lighten and facilitate the labors, and augment the profits, of those more or less extensively engaged in farm husbandry, stock growing, dairying, orcharding, etc., it will by no means forget or overlook the wants and interests of city, village and suburban residents who cultivate only fruit, vegetable and flower gardens. For each of these classes of cultivators the RURAL has special departments, and hopes to render all valuable assistance during the season—thus making itself a useful if not indispensable visitor.

FOR THE PROTECTION OF AGRICULTURE.

ECONOMY is doubtless important, both in the body politic and the individual. It is also generally inadvisable for the Government of the United States to dabble in matters which can usually be left to the States or to private enterprise. These ideas are pretty firmly fixed in the minds of the farmers of the United States, and the result is that, so far as agricultural interests are concerned, the strictest economy of expenditure has always been practiced. No matter how extravagance might run riot in every other department, it was always argued that the farmers didn't want any unnecessary expense. In short, "running economy into the ground" seemed to be the staple idea of legislators, which means, of course, that economy is only to be practiced where the interests of tillers of the soil are involved. We have had millions of dollars appropriated for war, navy, foreign diplomacy, and the agricultural industry of the country largely defrays the expense; but every penny devoted to matters directly affecting the farmer is given as grudgingly as if some honest and hardworking farmer were taking the money directly from his own thin pocketbook. The worst of all is that many farmers seem to approve this false idea of economy, and the agricultural press even criticises an appropriation for the benefit of farmers, as if only there could wasteful extravagance be found. It is high time that we should get over this idea of running economy into the ground and imitate the farmer himself, who scatters seed generously in hope of a liberal harvest. Looked at in this light we shall find no law of Congress which will yield better results for the money expended than the bill recently introduced by Senator JOHN J. INGALLS of Kansas into the U. S. Senate for the Protection of Agriculture against injurious insects. The Bill is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That the Secretary of the Interior shall have authority to appoint a board of commissioners, and to fill all vacancies which may occur therein, on the nomination of the council of the National Academy of Sciences, to consist of three entomologists eminent in their profession.

Sec. 2. That the said commissioners shall devote themselves to the investigation of those insects which are most destructive to the crops of farmers and planters, and especially of the Rocky Mountain locust, the rhinch-bug, the army-worm, the cotton-worm, the Hessian fly, and other insects injurious to the great staples, wheat, corn and cotton, in order to devise successful methods for the destruction of such insects. The commissioners shall report the results of such investigations and methods at least once in each year to the Secretary of the Interior, by whom the same shall be transmitted to Congress. As soon also as the information gathered shall enable them, the commissioners shall compile practical instructions for the repression of the different insects referred to.

Sec. 3. That the said commissioners shall be appointed for the term of five years, and vacancies shall be filled for the residue of the term only; and they shall respectively receive five thousand dollars per annum, to be paid monthly from the date of original appointment, and shall have clerical assistance, office-room, fuel, stationery, chemicals, and traveling expenses, not to exceed in cost thousand dollars per annum.

Sec. 4. That the sum of thousand dollars is hereby appropriated for the purpose of carrying out the objects of this act.

Sec. 5. That this act shall take effect and be in force on and after its passage.

This bill will probably require an appropriation of less than twenty thousand dollars per year, or not more than is yearly paid in maintaining diplomatic relations at some of the second or third-rate countries where our diplomatic service is entirely useless. Sticklers for economy may as well begin in our foreign diplomatic service in urging their ideas, instead of applying them exclusively to home interests. The cotton-worm, locust, potato-beetle and other enemies of the farmer, yearly diminish our agricultural product by hundreds of millions of dollars, and if there is any remedy, the farmers of the United States are clearly entitled to its benefit.

THE CENTENNIAL CORN PREMIUMS.

IN reply to various inquiries concerning the above offers to farmers a few words of further explanation will perhaps be sufficient. The importance and value of Indian corn to this country and to the human race, are clearly beyond any question. To stimulate farmers, therefore, to aim at better results in the production of this cereal, so as to render it more remunerative to the producer and less costly to the consumer, is an object worthy of the best efforts of thoughtful men.

On another point, it is sufficient to say that these premiums, as already partly explained, are due in a large measure to the liberality of other parties. My first offer in corn culture was made over a year ago through the Elmira Farmers' Club. The results then obtained were so remarkable that I was recently induced to make another offer through the public press. I now find that the growing interest in the subject and the increasing facilities for promoting it have made it expedient to enlarge the plan. This course is also fully warranted by the proffered co-operation of patriotic persons interested in husbandry, and perhaps still further by the liberality of dealers, publishers and others who, prompted by a generous sympathy with the farming interest, have offered their goods as premiums at prices so exceptionally low that the effect has been to increase the number and value of the offers. Certainly those who have thus enlarged the general plan of this competition are fairly entitled to the chief credit of the enlarged result which now seems likely to expand into unexpected proportions. The amount of my own contributions (beyond my time and efforts, which are cheerfully given,) is comparatively unimportant; but my attention has been for years devoted to the problem of husbandry, and especially to such questions as this competition will probably help to solve. There are possibilities in corn culture which, though very important and fairly within reach, have never yet been attained, and there is no better time for a grand concerted movement in this direction by our farmers than the great historic year on which we have entered.

The following are some of the business firms whose liberal offers have given an impulse to this movement:

R. H. ALLEN & Co., THE RURAL PUBLISHING Co., FRANK LESLIE, B. K. BLISS & SONS, SHELDON & Co., PETER HENDERSON & Co., H. J. BAKER & BROS., A. S. BARNES & Co., The New York Plow Co., C. T. DILLINGHAM, W. L. ALLISON of New York, HENRY A. DREER, HARRISON BROS. & Co. of Phila., W. H. BOWKER & Co. of Boston, JAMES VICK of Rochester, and others.

It will be seen by reference to Premium List in RURAL NEW-YORKER of Feb. 26, that the offers made to Granges and Clubs are the largest in amount, and that the experiment proposed involves practical questions of the greatest moment, and which the best minds in the country are already engaged in solving.

All Farmers, Granges and Clubs who are inclined to compete for these Premiums, will receive a descriptive circular, as soon as printed, by inclosing their address with stamp.

Any other dealers, beside those who have already enlisted, are invited to co-operate in promoting this object.—CONRAD WILSON, P. O. Box No. 4242, N. Y. City.

RURAL NOTES AND QUERIES.

New York State Dairymen.—At the Annual Meeting of the New York State Dairymen's Association and Board of Trade, held Feb. 21st at Little Falls, the following officers were chosen for the ensuing year: Pres.—X. A. WILLARD, Little Falls. Sec.—Josiah Shull, Ilion. Treas.—D. H. Burrell. Vice-Pres'ts.—Geo. W. Hoffman, Elmira; John Shattuck, Norwich; Dr. E. G. Crafts, Binghamton; C. P. Root, Gilbertsville; S. M. Babcock, Friendship; F. Blanding, Brookfield; E. W. Stewart, Lake View; Gardiner P. Weeks, Syracuse; I. P. Roberts, Ithaca; Arba Campbell, Owego, C. L. Sheldon, Lowville; Dr. G. F. Cole, Canton; J. C. Cooper, Theresa; F. Blanchard, Jamestown; Hon. Willard Hodges, Rochester; S. Osborn, Fulton; H. M. Kennedy, Utica; J. Harvey Smith, Fort Plain; Henry Yost, Johnstown. Directors—Fred. Ives, Salisbury; J. V. H. Scovill, Paris; Hon. R. A. Young, Norwich; L. T. Hawley, Syracuse; Wm. Blanding, Hawleytown; Hon. H. Lewis, Frankfort. Manager of Board of Trade Rooms—R. S. Whitman, Little Falls. The invitation of the Elmira Farmers' Club to hold the next annual convention at Elmira, was accepted.

Newburg Bay Hort. Society.—At the recent annual meeting of this progressive Society the following officers were elected for the ensuing year: President—ALFRED BRIDGEMAN. First Vice President—W. W. Carson; Second Vice President—Odell S. Hathaway. Secretary—Charles St. John Vail. Cor. Secretary—David A. Scott. Treasurer—Daniel Smith. Executive Committee—Isaac C. Chapman, C. S. Jenkins, T. S. Force, W. D. Barns, W. B. Brown, John F. Van Nort, Rev. E. P. Roe, Daniel T. Weed, John Heron, S. G. Kimball. The officers of the Society are also ex-officio members of the Executive Committee. Directors—C. S. Jenkins, T. H. Roe. Auditors—Francis Scott, J. N. Weed. The report of the Treasurer showed a balance in the treasury, and no debts. The subject of exhibitions during the year was referred to the Executive Committee.

Newspaper Change.—We learn that the Live Stock Journal of Buffalo has been sold to the National Live Stock Journal Company of Chicago, which will take its subscriptions and fill them with the Chicago monthly in its stead. This arrangement removes a valuable and well-edited monthly in this somewhat overcrowded department of Agricultural Journalism, and is so far a loss to the stock-growing community. We trust it will not involve the permanent withdrawal of its Editor, Mr. E. W. STEWART, from the discussion of Agricultural topics, in which he has done good work and achieved an excellent reputation. Our Chicago contemporary, with this removal of its competitor, can now drop its distinctive prefix, and will probably be better than ever.

An Old Landmark Gone.—The old elm tree which stood on Boston Common was blown down in the severe storm of Tuesday, Feb. 15. It is thought that this tree was older than the first settlement of the country, and for many years it had been decayed and liable to fall in any storm. The "Old Elm" was a notable object during the Revolutionary war, being often illumined by hanging lanterns in times of popular rejoicing. We have some mementoes of the old landmark in the form of leaves which we plucked from it while on a visit to Boston Common last season, and which have been prepared for preservation.

English Manufactures are finding competition from this country, not alone in cotton goods but in hardware. A paragraph in the Sheffield Telegraph says an American merchant arrived in that city a few days ago with a consignment of light steel hayforks, shovels, spades, etc., of American make, which he proposes to sell at lower than Sheffield prices for similar goods. American implements are also of generally better finish and quality than those of England. This superiority is conceded in large articles and is beginning to be recognized in those of less weight.

The Southern Industrial Exposition, at New Orleans, was successfully inaugurated last Saturday. Gov. HENDRICKS of Indiana delivered the opening address. A telegram says there was a large gathering to hear him speak, which became an enthusiastic one as he touched upon patriotic topics. His references to the prevalence of the Union sentiment in the South, and the dawning of an era of good feeling toward the South in the North, were heartily applauded. The speech was an argument for a more diversified industry in the South, coupled with remarks upon the South as a market for the productions of the North.

Hops.—The price of this staple has at last begun to advance. It was known last fall that the crop in Europe was cut off by mildew and other contingencies, but it was only lately that this fact has produced its natural effect. Only the better qualities of hops are yet in demand, but for these fair prices will be paid.

RURAL BREVITIES.

KANSAS is importing immense numbers of sheep.

MANY families in Central Georgia use only home-grown tea.

A PENNSYLVANIA milkman has three times been fined $100 for watering his milk.

THE RURAL pays good dividends to every soil cultivator who reads it carefully.

RAIN water is the best of all water for plants. Those keeping house plants will take notice.

NEW subscribers can have back numbers of the RURAL from January, or begin now, as preferred.

J. C. LOOMIS of Champion, Jefferson Co., N. Y., made 150 lbs. of maple sugar during the thaw in February.

THE RURAL is designed to benefit every one interested in rural and domestic affairs, wherever located.

KENTUCKY farmers are agitating for an Agricultural Bureau, and the Legislature will probably establish one.

J. MOORE, Jr. of Marshall, Mich., recently sold 40 young sheep, stall fed, weighing 118 lbs. each, at $6 per cwt.

G. W. PALMER of Vevay, Ingham Co., Mich., last season raised 17½ bushels of very fine clover seed on three acres.

IT is not too late to form clubs for the RURAL, or make additions to present ones, and secure premiums accordingly.

VANDERBILT BROS., 23 Fulton St. send us their seed and implement list which will be of interest to farmers and gardeners.

MARCH is a good time to subscribe for the RURAL, for all who have either a farm in the country or a town or suburban garden.

THE Canada Farmer is one of the best monthlies among our exchanges, and merits, as we trust it receives, a large patronage.

THE Mich. Ag. College opened its last term on the 23d ult. with a full complement of students—all that could be accommodated.

THE Mich. Farmer gives reports that the winter has been unfavorable to wheat and clover in some sections of the Peninsular State.

A LEAD mine has been discovered in Porter Co., Ind., and the people are as excited as if gold had come to light in their neighborhood.

THIRTY-TWO bachelors own and work a farm of 4,600 acres in Bell County, Texas. There is good and much needed work for a Grange thereabouts.

IN Germany they have introduced a new system of drying eggs. A "condensed egg factory" has been established at Passau, with an agency at London.

A BARREL of flour contains 14 stone—196 lbs. A stone weight in England is 14 lbs.; hence 14x14 lbs. equals 196 lbs., making it an even weight for that country.

A CORRESPONDENT of the Maine Farmer says in breaking steers place the most docile one on the off-side, as he can make a good near-ox of almost any steer.

AULTMAN, MILLER & Co. of Akron, Ohio, are getting out a new machine to be known as the "New Buckeye Mower." It is light and compact, being all iron. The price will not exceed $100.

THE Mich. Farmer says the next annual fair of the Macomb Co. Ag. and Hort. Society is to be held at Ann Arbor, Sept. 26-29. Queer, as Ann Arbor is, or used to be in Washtenaw Co.

THE Canada Farmer condemns horse racing at County Fairs, and says:—"Happily amongst us Canadians this species of gambling at our agricultural fairs is the exception rather than the rule."

MARTIN ELLIOTT of Vincennes, Ind., wants the address of some breeder of pure Suffolk hogs. There is great scarcity of hogs in that vicinity on account of hog cholera, and breeders would do well to advertise.

WHEN land is in good condition and the weather right the sooner corn is planted the better. The hand corn planter of DAVIS & Co. Ithaca, N. Y., meets a frequent requirement among farmers who grow corn largely. In saving of time one of these machines will pay its cost the first week of using.

WE have received from Sec. REYNOLDS a copy of the proceedings of the W. N. Y. Horticultural Society, held at Rochester in January last. The proceedings make a valuable pamphlet of about sixty pages which is sent to members of the Society and friends of Horticultural progress.

"PHŒNIX'S Plant Catalogue, including Plant Novelties, Greenhouse and Bedding Plants, in eight classes, each alphabetically arranged"—comes to us in neat style from F. K. PHŒNIX of the Bloomington (Ill.) Nursery. Also the Centennial Wholesale Price List of the Bloomington Nursery.

BUSINESS NOTICES.

Sore Throat, Cough, Cold, and similar troubles, if suffered to progress, result in serious pulmonary troubles, oftentimes incurable. "*Brown's Bronchial Troches*" reach directly the seat of the disease, and give almost instant relief.

ECKSTEIN, HILLS & Co.'s **"Phœnix Pure White Lead"** is the whitest, finest; has the best body and most covering capacity of any lead in market.

THE OLD FARM GATE.

THE old farm gate hangs, sagging down,
On rusty hinges, bent and brown;
Its latch is gone, and here and there
It shows rude traces of repair.

The old farm gate has seen, each year,
The blossom bloom and disappear;
The bright green leaves of spring unfold,
And turn to autumn's red and gold.

The children have upon it clung,
And in and out with rapture swung,
When their young hearts were good and pure—
When Hope was fair and Faith was sure.

Beside that gate have lovers true
Told the old story, always new;
Have made their vows; have dreamed of bliss,
And sealed each promise with a kiss.

The old farm gate has opened wide
To welcome home the new-made bride,
When lilies bloomed and locusts fair
With their sweet fragrance filled the air.

That gate with rusty weight and chain,
Has closed upon the solemn train,
That bore her lifeless form away,
Upon a dreary autumn day.

The lichens gray and the mosses green
Upon its rotting posts are seen:
Initials, carved with youthful skill,
Long years ago, are on it still.

Yet dear to me above all things,
By reason of the thoughts it brings,
Is that old gate, now sagging down,
On rusty hinges bent and brown.

The Story-Teller.

"SOMETHING."

One of Hans Christian Andersen's Stories.

"I WANT to do something," said the eldest of five brothers. "I want to do something in the world. I don't care how humble my position in society, if I only effect some good, for that will really be something. I'll make bricks, for they are quite indispensable things, and then I shall truly have something."

"But that something will not be enough," quoth the second brother. "What you intend doing is just as much as nothing at all. It is journeymen's work, and can be done by a machine. No, I would rather be a bricklayer, at once, for that is something real, and that's what I will be. That brings rank; as a bricklayer, one belongs to a guild, and is a citizen, and has one's own flag and one's own house of call. Yes, and if it all goes well, I will keep journeymen. I shall become a master bricklayer, and my wife shall become a master's wife—that is what I call something."

"That's nothing at all," said the third. "That is beyond the pale of the guild, and there are many of those in a town that stand far above the mere master artisan. You may be an honest man; but as a 'master' you will after all only belong to those who are ranked among common men. I know something better than that. I will be an architect, and will thus enter into the territory of art and speculation. I shall be reckoned among those who stand high in point of intellect. I shall certainly have to serve up from the pickax, so to speak; so I must begin as a carpenter's apprentice, and must go about as an assistant in a cab, though I am accustomed to wear a silk hat. I shall have to fetch beer and spirits for the common journeymen, and they will call me 'thou,' for that is insulting! But I shall imagine to myself that the whole thing is only acting, and a kind of masquerade. To-morrow—that is to say, when I have served my time—I shall go my own way, and the others will be nothing to me. I shall go to the academy, and get instructions in drawing, and shall be called an architect. That is something! I may get to be called 'sir,' and even 'worshipful sir,' or even get a handle at the front or the back of my name, and shall go on building and building, just as those before me have built. That will always be a thing to remember, and that is what I call something!"

"But I don't care at all for that something," said the fourth. "I won't sail in the wake of others and be a copyist. I will be a genius; and will stand up greater than all the rest of you together. I shall be the creator of a new style, and will give the plan of a building suitable to the climate and material of the country, for the nationality of the people, for the development of the age—and an additional story for my own genius."

"But supposing, the climate and the material are bad," said the fifth, "that would be a disastrous circumstance; for these two exert a great influence! Nationality, moreover, may expand itself until it becomes affectation, and the development of the century may run wild with your work, as youth often runs wild. I quite realize the fact that none of you will be anything real, however much you may believe in yourselves. But, do what you like, I will not resemble you; I shall keep on the outside of things, and criticise whatever you produce. To every work there is attached something that is not right—something that has gone wrong; and I will ferret out and find fault with it; and that will be doing something."

And he kept his word; and everybody said concerning this fifth brother, "There is certainly something in him; he has a good head; but he does nothing." And by that very means they thought something of him.

Now, you see this is only a little story; but it will never end so long as the world lasts. But what became of the five brothers? Why, that is nothing and not something. Listen, it is a capital story.

The eldest brother, he who manufactured brick, soon became aware of the fact that every brick, however small it might be, produced for him a little coin, though this coin was only copper; many copper pennies laid one upon the other can be changed into a shining dollar; wherever one knocks with such a dollar in one's hand, whether at the baker's or the butcher's, or the tailor's—wherever it may be, the door flies open, and the visitor is welcomed, and gets what he wants. You see that is what comes of bricks. Some of those belonging to the eldest brother certainly crumbled away, or broke in two, but there was a use even for these.

On the high rampart—the wall that kept out the sea—Margaret, a poor woman, wished to build herself a little house. All the faulty bricks were given to her, a few perfect ones into the bargain, for the elder brother was a good-natured man, though he certainly did not achieve anything beyond the manufacture of bricks. The poor woman put together the house for herself. It was little and narrow, and the single window was quite crooked. The door was too low, and the thatched roof might have shown better workmanship. But after all, it was a shelter; and from the little house you could look far across the sea, whose waves broke valuly against the protecting rampart on which it is built. The salt billows spurted their spray over the whole house, which was still standing when he who had given the bricks for its erection had long been dead and buried.

The second brother knew better how to build a wall, for he had served an apprenticeship to it. When he had served his time and passed his examination, he packed his knapsack and sang the journeyman's song:

While I am young I'll wander, from place to place I'll roam,
And everywhere build houses, until I come back home!
And youth will give me courage, and my true love won't forget;
Hurrah then for a workman's life! I'll be a master yet!

And he carried his idea into effect. When he had come home and become a master, he built one house after another in the town. He built a whole street; and when the street was finished and became an ornament to the place, the houses built a house for him in return that was to be his own. But how can houses build a house? If you ask them they will not answer you; but people will understand what is meant by the expression and say, "Certainly, it was the street that built the house for him."

It was little, and the floor was covered with clay; but when he danced with his bride upon the clay floor, it seemed to become polished oak; and from every stone in the wall sprung forth a flower, and the room was gay, as if with costliest paper hanger's work. It was a pretty house and in it lived a happy pair. The flag of the guild fluttered before the house and the journeymen and apprentices shouted hurrah! Yes, he certainly was something! And at last he died, and that was something, too.

Now came the architect, the third brother, who had been at first a carpenter's apprentice, had worn a cap and served as an errand boy, had afterward gone to the academy and had risen to become an architect and to be called "honored sir." Yes, if the houses of the street had built a house for the brother who had become a bricklayer, the street now received its name from the architect, and the handsomest house in it became his property. That was something and he was something; and he had a long title before and after his name. His children were called genteel children, and when he died his widow was "a widow of rank," and that is something!—and his name always remained at the corner of the street and lived on in the mouth of every one as the street's name—and that was something!

Now came the genius of the family, the fourth brother, who wanted to invent something new and original, and an additional story on top of it for himself. But the top story tumbled down and he came tumbling down with it and broke his neck. Nevertheless he had a splendid funeral with guild flags and music; poems in the papers and flowers strewn on the paving stones in the streets; and three funeral orations were held over him, each one longer than the last, which would have rejoiced him greatly, for he always liked it when people talked about him; and a monument was also erected over his grave. It was only one story high, but still it was something.

Now he was dead, like the other three brothers; but the last, the one who was a critic, outlived them all: and that was quite right, for by this means he got the last word, and it was of great importance to him to have the last word. The people always said he had a good head of his own. At last his hour came and he died, and came to the gates of Paradise. There souls always enter two-and-two, and he came up with another soul that wanted to get into Paradise too, but who should this be but old Dame Margaret, from the house upon the sea-wall?

"I suppose this is done for the sake of contrast, that I and this wretched soul should arrive here at exactly the same time," said the critic. "Pray, who are you, my good woman?" he asked. "Do you want to get in here, too?"

And the old woman courtsied as well as she could; she thought it must be St. Peter himself, talking to her.

"I am a poor old woman of a very humble family," she replied. "I'm old Margaret that lived in the house on the sea-wall."

"Well, and what have you done? What have you accomplished down there?"

"I have really accomplished nothing at all in the world; nothing that I can plead to have the doors here opened to me. It would be a real mercy to allow me to slip in through the gate."

"In what manner did you leave the world?" asked he, just for the sake of saying something; for it was wearisome work standing there and saying nothing.

"Why, I really don't know how I left. I was sick and miserable during my last year, and could not well bear creeping out of bed and going out suddenly in the frost and cold. It was a hard winter, but I have got out of it all now. For a few days the weather was quite calm but very cold, as your honor must very well know. The sea was covered with ice as far as one could look. All the people from the town walked out upon the ice, and I think they said there was a dance there and skating. There was beautiful music and a great feast there, too; the sound came into my poor little room where I lay ill. And it was toward the evening; the moon had risen beautifully, but it was not yet in its full splendor. I looked from my bed out over the wide sea, and far off, just where the sea and sky join, a strange, white cloud came up. I lay looking at the cloud and I saw a little black spot in the middle of it that grew larger and larger; and then I knew what it meant, for I am old and experienced, though the token is not often seen. I knew it, and a shuddering came upon me. Twice in my life have I seen the same thing; and I knew there would be an awful tempest and a spring flood, which would overwhelm the poor people who were now drinking, dancing and rejoicing—young and old, the whole city has issued forth; who was to warn them if no one saw what was coming yonder or knew, as I did, what it meant? I was dreadfully alarmed, and felt more lively than I had done for a long time. I crept out of bed and got to the window, but could not crawl further, I was so exhausted. But I managed to open the window. I saw the people outside running and jumping about on the ice. I could see the beautiful flags that waved in the wind. I heard the boys shouting "hurrah!" and the servant men and maids singing. There were all kinds of merriment going on. But the white cloud with a black spot! I cried out as loud as I could, but no one heard me; I was too far from the people. Soon the storm would burst and the ice would break, and all who were upon it would be lost without remedy. They could not hear me, and I could not come out to them. Oh! if I could only bring them ashore! Then kind heaven inspired me with the thought of setting fire to my own bed, and rather to let the house burn down than that all those people perish so miserably. I succeeded in lighting up a beacon for them. The red flames blazed up on high and I escaped out of the door, but fell down on the threshold and could get no further. The flames rushed out toward me, flickering through the window, and rose high above the roof. All the people on the ice yonder beheld it, and ran as fast as they could, to give aid to the poor old woman who, they thought, was being burned to death. Not one remained behind. I heard them coming; but I also became aware of a rushing sound in the air; I heard a rumbling like the sound of heavy artillery; the spring flood was lifting the covering of ice, which presently cracked and burst into a thousand fragments. But the people succeeded in reaching the sea-wall. I saved them all! But I fancy I could not bear the cold and fright, and so I came up here to the gates of Paradise. I am told they are open to poor creatures like me—and now I have no home left down upon the ramparts; not that I think this will give me admission here."

Then the gates of heaven were opened and the angel led the old woman in. She left a straw behind her, a straw that had been in her bed when she set the bed on fire to save the lives of many; and this straw had been changed into pure gold—into gold that grew and grew, and spread into beautiful leaves and flowers.

"Look; this is what the poor woman brought," said the angel to the critic. "What dost thou bring? I know that thou hast accomplished nothing—thou hast not made as much as a single brick. Ah, if thou couldst only return and effect at least so much as that! Probably the brick, when thou hast made it, will not be worth much; but if it were made with good will, it would at least be something. But thou canst not go back, and I can do nothing for thee!"

Then the poor soul, the old woman who had lived on the dike, put in a petition for him. She said:—"His brother gave me the bricks and the pieces out of which I built my house, and that was a great deal for a poor woman like me. Could not all those bricks and pieces be counted as a single brick in his favor? It was an act of mercy. He wants it now; and is not this the very fountain of mercy?"

Then the angel said:—"Thy brother whom thou hast regarded as the least among you all, he whose honest industry seemed to thee as the most humble, hath given thee this heavenly gift. Thou shalt not be turned away. It shall be vouchsafed to thee to stand here without the gate and to reflect and repent of thy life down yonder; but thou shalt not be admitted until thou hast in real earnest accomplished something."

"I could have said that in better words!" thought the critic; but he did not find fault aloud—and for him, after all, that was "something."

THE WINDS OF MARCH.

THE FARMER'S DAUGHTER.

"THE idea is simply preposterous!"

Cleve Fairfax drew his tall, well-proportioned figure to its utmost hight, his lip curled as he did so.

"Yes," said his elder brother, irresolutely, feeling his moustache; "but, you see, Charlie is so set on it, and——"

"That makes no difference, one way or the other," interrupted Cleve, with that quiet firmness which made one think he might be molded in iron. "It is impossible—neither more nor less! Your son, my nephew, to marry a country girl—a Wisconsin farmer's daughter—simply because she has a pretty face and a pair of hazel eyes! Why, man, it would be a lifelong mistake."

And thus saying, Mr. Fairfax passed down the broad aisle.

Mabel Thorpe, sitting in the crowd under the balcony of the Academy of Music, had heard all the brief colloquy with a stinging through her veins and a burning flush upon her cheek.

"Cruel! cruel!" she thought, as they passed on, "and needlessly so, too! I did not care for Charles Fairfax. I should never have infringed on the dignity of their race by marrying him. They need not have been afraid."

And Mabel drew herself up with a pride no less genuine than that of the Fairfaxes, if she was "a Wisconsin farmer's daughter."

Miss Thorpe went home feeling that New York had lost all its charms for her. She had been very happy in the great metropolis, with a girl's innocent, unsophisticated happiness; but it was all over now. And when Charles Fairfax called the next day he was astounded to learn that Miss Thorpe had gone home.

So ended Charley's young dream of love, until the next pretty girl should strike its answering chord. And Cleve Fairfax thought no more of the girl who had given him a momentary annoyance, save to congratulate himself on the fact that the danger was over.

An October afternoon, with an atmosphere full of bracing vigor, in the wide chimney of the long, low, farm-house kitchen blazed a fire of well-seasoned logs, and Mabel Thorpe, standing in the level crimson light, seemed the very incarnation of the home deity, in her calico dress and ruffled white apron.

"How is he now, mother?" she asked, with a slight shadow of anxiety in her eyes, as a plump, matronly dame came down the narrow, winding stairway that led up from the chimney jamb.

"Oh, he's better," said Mrs. Thorpe, briskly. "He'll do well enough now. I don't see how he could possibly have been so careless as to let the gun discharge itself through his own arm."

"It will be some time before he recovers, I suppose, mother?"

"Your father says he wouldn't be surprised if it was a month before he got well around again."

"A month!" Mabel Thorpe drew a long breath. Of all men in the world, she most disliked and distrusted Cleve Fairfax, yet here he was, thrown, as it were, on their hands for the very boon of his life. Little had honest old Obed Thorpe thought when he brought home the disabled sportsman, upon whom he had stumbled through the merest chance in the world, whom he was bearing across his threshold. Mabel did not judge it best to enlighten him.

"We were never introduced to each other," she thought, "and it is not likely that he will recognize me, or even remember my name."

But when Cleve began to get better, Mabel could not but feel that a new change was coming over the life that had been rescued from the grave.

And Cleve, watching her, began to have vague ideas of a home and its home goddess.

The marvel and mystery of love—who may ever hope to read its enigmas? For Cleve Fairfax, who had run the gauntlet of innumerable New York seasons heart-whole and unscathed, had come beneath the lowly roof of a Western farm house to lose his heart after all!

"Mabel!"

He spoke one night, after a long silence, as she sat opposite, quiet and self-contained.

"Yes, Mr. Fairfax."

"Do you know that the doctor has decided that I may go away next week?"

"I heard them say so this morning."

"Shall you be sorry to have me gone, Mabel?"

She glanced quietly toward him.

"Of course it will be lonely without you, Mr. Fairfax."

He looked wistfully at her. What made him love her so passionately? What charm did she hold that so attracted his whole nature?

"Mabel," he said, suddenly, "I cannot go away from here until I have asked you one question. I cannot leave you until I tell you how dearly I love you—how earnestly I long to make you my wife."

Mabel looked up, pale, but self-possessed.

"The idea is simply preposterous!" she said; the very words that had so chilled her upspringing happiness a year ago, when she sat under the pillars of the balcony in the Academy of Music.

"Preposperous, Mabel! and why?"

"It is impossible—neither more nor less," she went on deliberately. "You to marry a country girl—a Wisconsin farmer's daughter—simply because she has a pretty face and a pair of hazel eyes! Why, man, it would be a lifelong mistake!"

Cleve Fairfax felt the blood rising hot and red to his temples. He had an excellent memory, and in an instant the whole scene in the opera house rose up before his mind's eye. His own batteries were turned against him with a vengeance.

"Mabel—you heard me then?"

"I heard you then, Mr. Fairfax."

"But I meant—I didn't know."

"It is not at all necessary to tell me what you meant, or what you knew or didn't know. I am the same Mabel that I was then; nor have the haughty race of the Fairfaxes waxed less aristocratic, that I am aware of. Consequently you will perceive the futility of further argument."

"But I have learned to know and love you since then," pleaded Cleve, eagerly.

"I am sorry you should be disappointed in anything you have set your heart upon, Mr. Fairfax, but my mind is fully made up and cannot be altered. Moreover, I am engaged to a prince among men—one of those who make agriculture the royal pursuit it is; nor would I exchange my destiny for the highest place in all your hollow city life. Leave me here to be happy and go you on your way. You are answered."

And Cleve Fairfax, dispirited and disappointed, went back to New York and lived a bachelor to the end of the chapter, and all for the love of a "Wisconsin's farmer's daughter."

PETER BENNET'S CASE.

If Mr. Stephens should be at home and his mind not be absorbed by public affairs, the visitor will find in him the best and most prolific anecdotist of the day.

One story—alas that he cannot sit in the types to tell it!—is the Peter Bennet speech. A Dr. Royston, doubtless a most excellent man, has sued Mr. Bennet, a farmer, for his bill. "Little Aleck," as Alexander is minified by his friends, told his client, Peter B., that the case of service and its value were proved against him in legal form, and there was no real defense. But the old farmer insisted that his lawyer should "speak to the case." Mr. Stephens told him that he ought to speak himself if he thought a speech could be made, and was surprised by the retort:—"I will, if Bobby Toombs won't be too hard on me." Mr Toombs promised and Peter Bennet began:

"Gentlemen of the jury, I ain't no lawyer and no doctor, and you ain't nuther. And if we farmers don't stick together, these here lawyers and doctors will get the advantage of us. I ain't no objections to lawyers and doctors in their place, and some is clever men; but they ain't farmers, gentlemen of the jury. Now this Dr. Royston was a new doctor, and I sent for him to come to doctor my wife's sore leg. And he did, and put some salve truck on it and some rags, but never did a bit of good, gentlemen of the jury. I don't believe he's no doctor, no way. There's doctors as I know is doctors, sure enough; but this ain't no doctor at all."

This was evidently telling, and Dr. Boyston put in with, "Look at my diploma, and see if I am not a doctor."

"His diploma!" said the new-fledged orator, with great contempt. "That ain't nothin', for no piece of paper ever made a doctor yet."

"Ask my patients," shouted the now furious physician.

This was the conventional straw that seemed to break the back of the orator's patience. "Ask your patients?" he said, in slow and mournful deliberation. "Ask your patients! *Why, they're all dead!*" Then, in rapid declamation, he named case after case, well known, but mostly among the negro servants of his neighbors, where his opponent had treated them and their owners buried them and continued:—"Ask your patients! Why, I would have to seek them in the lonesome churchyard and rap on the silent tomb to get answers from the dead. You know they can't say nothin to this case, for you've killed them all!" The applause closed the speech, and the defendant had his case.—*Harper's Magazine.*

HOW HE PROPOSED.

A story is told of a preacher who lived about forty years ago. He was a bachelor, and we could write his real name, but prefer to call him Smith. He resisted many persuasions to marry, which his friends were constantly making, until he had reached a tolerably advanced age, and he himself began to feel the need of, or, at least, to have new ideas of the comfort of being nursed with woman's gentle care. Shortly after entering one of his circuits, a maiden lady, also of ripe years, was strongly recommended to him, and his friends again urged that he had better get married, representing that the lady named would probably not refuse to accept him, notwithstanding his reputed eccentricities.

"Do you think tho?" responded the dominie, for he very perceptibly lisped; "then I'll go and thee her?

He was a man of his word. His ring at the door-bell was answered by the serving-maid.

"Ith Mith P—— within?" briskly but calmly asked the lover.

"Yes sir. Will you walk in?"

"No, I thank you. Be kind enough to thay to Mith P—— that I with to thpeak to her a moment."

Miss P—— appeared, and repeated the invitation to walk in.

"No, thank you; I'll thoon explain my buthiness; I'm the new preacher. I'm unmarried. Friendth think I'd better marry. They recommend you for my wife. Have you any objection?"

"Why, really, Mr. Sm—"

"There—don't anthwer now. Will call thith day week for your reply. Good day."

On that day week he re-appeared at the door of Miss P——'s residence. It was promptly opened by the young lady herself.

"Walk in, Mr. Smith."

"Cannot ma'am. Have no time. Start on my circuit round in half an hour. Ith your anthwer ready, ma'am?"

"Oh, *do* walk in, Mr. Smith."

"Can't indeed, ma'am. Pleath anthwer me—Yeth or No."

"Well, Mr. Smith, it is a very serious matter. *I should not like to get out of the way of Providence*—"

"*I perfectly understand you*, Mith P——. We will be married thith day week. I will call at thith hour. Pleath be ready, ma'am."

He called on that day week, at that hour. She was ready; they were married and lived happily several years.

SOME ONE TO LOVE.

Perhaps one of the most positive proofs we have of the soul's independence of the body is our great need of love and of something to love. Were we mere animals—creatures doomed to perish after few years of life in this world—that which contents the brute would also content us. To eat and sleep well, to have an easy time of it, would be enough. As it is, we may have all these things, and health to enjoy them, and yet be utterly wretched. Neither can mental food satisfy us. "Some one to love" is our heart's cry.

When the atmosphere of tenderness is about us we rejoice; when people are harsh and unkind we suffer. We begin life wishing to love all people, and believing that they love us. Experience hardens us. Our dear ones grow fewer; but, as long as reason lasts, we must have some one—we must at least imagine that some one loves us. The parents, sisters and brothers—that dearest friend whom we promise to love and cherish until death parts us—these come into our lives and fill them up. Afterwards come the little children—frail, helpless babes, who need our care so much, and friends to whom we are not kin, yet who grow dear to us.

Some have many loved ones, and some but one. Heaven help those who have none, though they are generally to blame for their empty-hearted ness, for kindness wins love. They are always wretched, and they often show their craving for something to love by cherishing some dumb animal—a dog, a kitten, a parrot, perhaps, on which they lavish carresses, which, better spent, would have bound some poor heart to theirs. Pride or morbid sensitiveness may have been at the bottom of their loneliness, and these pets fill the aching void a little!

Some one to love! It is the cry of the human soul, the note to which every human heart responds; the bond which will bind us all together in that other world where mourners shall be comforted and love shall reign forever.

HUSBANDS AND WIVES.

HUSBANDS.

Appleton's Journal says:—Ingratitude and indifference sometimes mar the character of men. A husband returns from his business at evening. During his absence, and throughout the live-long day, the wife has some little surprise, some unexpected pleasure, to make his home more attractive than ever. He enters, seemingly sees no more of what has been done to please him than if he were a blind man, and has nothing more to say about it than if he were dumb. Many a loving wife has borne in her heart an abiding sorrow, day after day, from causes like this, until, in process of time, the fire and enthusiasm of her original nature have burned out, and mutual indifference spreads its pall over the household

WIVES.

Many women have little idea of how greatly they shock the tastes and really endanger the affections of their husbands by their unseemly domestic apparel. There is not a man of sense and refined feeling anywhere who would not prefer some simple and chaste adornment for his wife in the morning to any extreme of splendor at the evening ball. Let a woman by all means dress brilliantly on those occasions that render it proper. We have no desire to abridge her privileges nor baffle her instincts in this particular; but we claim that it is important for her, if she value her household serenity, that she should give equal heed to her customary domestic attire. The female who goes about the house muddily dressed has no right to the title of woman. She is without those marks and indications by which she can be so classified.

A DISAPPOINTED POLITICIAN.

Yesterday, Si was found engaged in one of his philosophic, political harangues to some of his colored friends.

"Dese hyar 'publicans kin promise till do last day in de mornin', but dey ain't gwine to ketch dis hyar blackbird wid no more chaff!" he exclaimed positively.

"What's you mad 'bout? asked another darkey

"Dis is what I'm mad 'bout—mind my words now! Didn't dey say, when de war was played out, dat de nigger was gwine to be made just as good as de white people?"

"Ob koarse dey did."

"An' dat de nigger worked fur all dat de ole marsters has, and could soon yearn all dat property to demselves, hey?"

"Yes; dat's true, too."

"Dat de white folks waz gwine ter be pore as church mouses and niggers rich, hey?"

"Oom-hook; dat's what dey said!"

"Dat all sounded jus' as purty as readin' on a circus bill, didn't it?"

"You'se right, it did."

"Well, what makes me mad is dat circus hasn't arrove down hyar yit, an' we can't hear dat it's coming! Bres de Lord, de white folks is jes' as rich as eber, an' it wuz de nigger whar got busted eber sence, an' is gwine to stay busted! Dat's whar makes me mad, an' ef de 'publicans eber git anodder chance at me, I'll go die wid de yaller jandiss, a chawin' ole yaller 'leeshun tickets!"

No one felt capable of responding to Si's polut.

THE MARRIAGE QUESTION.

A Cincinnatian, who has five unmarried daughters, says: "A man has daughters; he knows that, unless married, a very unhappy old age is before them; he could provide them with husbands by boldly broaching the subject to a true man, that he had no objection to, as a son-in-law; now-a-days people expect the daughters to marry well; consequently, unless they are Madonnas in beauty, or dad immensely rich, they don't marry at all. Marry your daughters off; be sure that the man (poor, perhaps) whom you approach on such a subject is a gentleman—if he is, he would be flattered at the consideration—and if such a confidence was betrayed by him, he would be shunned and scorned by all for his cowardice. I have four daughters myself, and unless they are married during the next ten years, I shall endeavor to provide husbands for them myself." This sounds well, but would any woman place a very high value on such a husband? A man who would marry, but would not ask for a woman, is poor stock for a permanent investment.

Sabbath Reading.

THE JOY OF INCOMPLETENESS.

If all our lives were one broad glare
Of sunlight, clear, unclouded;
If all our path were smooth and fair,
By no soft gloom enshrouded;
If all life's flowers were fully blown
Without the sweet unfolding,
And happiness were rudely thrown
On hands too weak for holding—
Should we not miss the twilight hours,
The gentle haze and sadness?
Should we not long for storms and showers,
To break the constant gladness?

If none were sick and none were sad,
What service could we render?
I think if we were always glad,
We scarcely could be tender;
Did our beloved never need
Our patient ministration,
Earth would grow cold, and miss indeed
Its sweetest consolation;
If sorrow never claimed our heart,
And every wish were granted,
Patience would die, and hope depart—
Life would be disenchanted.

And yet in heaven is no more night,
In heaven is no more sorrow!
Such unimagined new delight
From grace from pain will borrow—
As the poor seed that underground
Seeks its true life above it,
Not knowing what will there be found
When sunbeams kiss and love it.
So we in darkness upward grow,
And look and long for heaven;
But cannot picture it below,
Till more of light be given.

"ROCK OF AGES, CLEFT FOR ME."

In the pleasant county of Devon, in one of its sequestered passes, with a few cottages sprinkled over it, mused and sang Augustus Toplady. When a lad of sixteen and on a visit to Ireland, he had strolled into a barn in which an illiterate layman was preaching—but preaching reconciliation to God through the death of his Son. The homely sermon took effect, and from that moment the gospel wielded all the powers of his brilliant and active mind. During his last illness, Augustus Toplady seemed to lie in the very vestibule of glory. To a friend's inquiry, he answered, with a sparkling eye:—"O, my dear sir, I cannot tell the comfort I feel in my soul—they are past expression. The consolations of God are so abundant that he leaves me nothing to pray for. My prayers are all converted into praise. I enjoy a heaven already within my soul." And within an hour of dying he called his friends and asked if they could give him up; and, when they replied in the affirmative, tears of joy ran down his cheeks as he added, "Oh, what a blessing that you are made willing to give me over to the hands of my dear Redeemer and part with me; for no mortal can live after having seen the glories which God has manifested to my soul." And thus died the writer of that beautiful hymn, "Rock of Ages, cleft for me."

THOUGHTS FOR THINKERS.

Like flakes of snow, that fall unperceived upon the earth, the seemingly unimportant events of life succeed one another. As the snow gathers together, so are our habits formed. No single flake that is added to the pile, produces a sensible change. No single action creates, however it may exhibit, a man's character; but as the tempest hurls the avalanche down the mountain, and overwhelms the inhabitant and his habitation, so passion, acting upon the elements of mischief, which pernicious habits have brought together by imperceptible accumulation, may overthrow the edifice of truth and virtue.

If thou bear the cross cheerfully, it will bear thee, and lead thee to the desired end, namely, where there shall be an end of suffering, though here there shall not be. If thou bear it unwillingly, thou makest for thyself a new burden, and increasest thy load; and yet, notwithstanding, thou must bear it. If thou cast away one cross, without doubt thou shalt find another, and that perhaps a heavier one.—*Thomas à Kempis.*

The cross is the concord of Scriptures, and, as it were, the boundary and border-land of old and new things. The cross is the death of vice, and the fountain and life of all virtue. The cross is the courage of those that are fighting bravely; the recovery of those that are fallen; the crown of those that are victorious. The cross subjects us to a momentary death and recompenses us with eternal life.—*Peter Damiani.*

How little is known of what is in the bosom of those around us. We might explain many a coldness could we look into the heart concealed from us; we should often pity where we hate, love when we curl the lip with scorn and indignation. To judge without reserve of any human action is a culpable temerity, of all our sins the most unfeeling and frequent.

From all fits of doubt, perplexity and fear—whether they respect the body or mind; whether they are a load to the shoulders, the head or the heart—the following is a radical cure, which may be relied on, for we have it from the Great Physician, "Cast thy burden on the Lord, and he will sustain thee."

Be frank with the world. Frankness is the child of honesty and courage. Say just what you mean to do on every occasion, and take it for granted that you mean to do just what is right.

Ladies' Portfolio.

YES, OR NO?

An Honest Love Letter.

DEAR lady, will you kindly lend
  Attention for awhile?
I'm not the man to sue and smirk,
  To gain a fair one's smile.
I'm far too dull to act the spark,
  Too blunt to play the beau.
I'll ask a question, plain and brief;
  Just answer—Yes, or No.

I cannot rave as lovers rave,
  Or swear as lovers swear;
My way is just to pass my word,
  And keep it, "fair and square."
I'm but an honest business man,
  As all my dealings show;
And clinch a bargain, at the start,
  With simple—Yes, or No.

My tongue is not attuned to talk
  Of lovers' smarts and darts;
I only know the honest way
  Of joining honest hearts,
The deepest waters quiet sleep;
  The shallow, murmuring, flow;
So, all the vow I give or ask
  Is briefly—Yes, or No.

I love you—that's the simple truth
  I love you as my life!
And all I have or hope to gain,
  I'd give to call you wife!
I've loved you since the day we met—
  'Twas just a year ago—
And after thinking for a year,
  I ask you—Yes, or No?

I do not promise that your life
  Shall be a dream of bliss.
I don't pretend that all my cares
  Will vanish at your kiss,
They're pretty sure to miss the mark,
  Who draw too long a bow.
I ask you—Will you take the chance?
  Just tell me—Yes, or No.

My heart, my fortune, home and name
  I ask you, then, to share.
If you'll accept, I'll be rejoiced;
  If not, I won't despair.
He's but a fool who stakes his all
  Upon a single throw.
If you won't have me, some one will;
  So is it—Yes, or No?

ON THE CONJUGAL DUTIES.

BY AN EX-EDITOR.

THERE was in the reign of GEORGE III. (*our* last king) a member of the English Parliament who emigrated to America and located himself in North Hempstead, Long Island, N. Y., where he purchased an estate on which he became a farmer of the first magnitude—both in theory and in sturdy practice. He made his farm a pattern one. Really he was a philanthropic agriculturist; for he did more to promote this cause than any other man of his time. While there he tested various methods of successful husbandry, studied the nature and requirements of plants and their adaptation to our latitudes, and wrote much on agricultural, horticultural and floral subjects for the public good, and gave to the world a manual in gardening entitled "The American Gardener," the merits of which have never been excelled by any other work to this day. Though written in North Hempstead in 1819 and dedicated at that time to "MRS. TREDWELL of Salisbury Place, Long Island," it was first published in London in 1821. He had been honored with the order of knighthood in England. His name and title were SIR WILLIAM COBBETT—better known, however, as PETER PORCUPINE by a weekly paper which he published over that signature. He seemed a second edition of BEN FRANKLIN, the POOR RICHARD of a little earlier date. He wrote another most practical and useful work entitled "Hints to Young Men," which is now out of print, but which we wish was republished and put into the hands of every young man in America. We know of nothing equal to it. In that work, among other things he exhibited, with much plain common sense, the advantages of early marriages. In this advice, indeed, COBBETT is not singular. Other sensible authors have advocated the same idea.

When the attachment is mutual and sincere there can, we think, be no doubt that early marriages have the advantage of producing a greater similarity of character and feelings in parties than can be secured in any later period of life, when the habits on both sides become fixed and rigid; and moreover, by entering early upon the responsibilities of the married state, young people are more likely to become settled on some definite purpose of life and feel called upon by necessity for exertion, which is always an indispensable condition of success and often of virtue. The history of connubial connexions show that those families enjoy the greatest degree of connubial happiness and succeed best in the business of life when the parents formed their connexion in early life, while every affection was honest and true, and while the yet unformed characters were not so confirmed and inflexible but that the husband and wife could find it easy to become assimilated into one mold. Much disparity in the eyes of these life-partners is hazardous to a firm union. There is something quite unnatural in such alliances. GOD never made the old to mix in the society of young people as companions and equals. Like only assimilates with like.

But it was not the writer's design in the present paper to indite a homily especially on early marriages. It was in his mind, rather, to discourse a little upon certain things that are necessary to maintain and perpetuate harmony and happiness in the domestic sanctuary. And first, as to the husband. Home must be to him the central point of attraction. Wherever he roams, whatever he is engaged in doing, his heart must turn thither with an ardent affection and solicitude. If he feels uneasy in the society of his family, one of two things may be affirmed as true—either he is the unqualified head thereof, or he is unfortunate in a partner whose disposition is calculated to discourage and alienate him. A man will be most likely to spend his leisure hours where he can find the most congenial companionship. If those hours are not devoted to the society of his wife and children but to the company of others, his wife will not be long in ascertaining his instincts; and when she finds herself neglected, she feels a dagger in her heart more cruel than a steel blade. If you would make home the seat of happiness, devote your spare hours to the companionship of her who has surrendered her all to you in the marriage covenant. Never give her reason to suspect that you delight more in the society of others than of herself. Above all, spend not the hours which should be devoted to the making of home happy in tavern, grog shop or gaming house.

We suppose all women will agree to the soundness of this advice; but let them not forget that they too have an important duty to perform here, which is indispensable to that strength of attachment and of those affections which are to make home an earthly paradise. It is woman that weaves the words which bind the heart of her husband to herself and home. In order for the husband to find happiness in his own house and home, in order to make him desire this as the central object of his loves, let him be treated with respect, courtesy and kindness. When he enters the house wearied with the cares and labors of life—a life devoted all along to the support and comfort of his family—let him not be met with a churlish look or with repulsive indifference. The outside world is sufficiently selfish and unfriendly. There is too much of selfishness evinced in all the business relations of life; against such unfriendliness he is called constantly to engage, and this strife he combats for the sake of his wife and little ones. But if on entering his home he meets with no sympathy in his wife's behavior; if she manifests little or no concern whether he has been successful or unfortunate in his plans, if she makes no effort to rejoice in his success or to cheer his depressed spirit under failures, his very heart will throb with disappointment and grief; and it need be no marvel if his ambition is destroyed, his efforts paralyzed, and if he seeks for sympathy and companionship somewhere else than his gloomy house. Woman is the sun of the domestic circle. Much depends upon her whether her husband shall find pleasure in his own castle or whether he shall roam about for the needed "crumbs of comfort." To insure her own happiness by making her husband delight in her companionship, she has a duty to perform which, if neglected, will make a hell of what was designed to be a heaven on earth. True, the husband can do much by forbearance and by kindly counsel to correct whatever of errors in his partner tend to discourage and repel him; but if his wishes and counsels are met only by railing and abuse, he will give up in despair, and consider his life thenceforth doomed to misery.

Much of the unhappiness that exists in families might be prevented and cured if both the husband and wife would agree between themselves—and faithfully abide by the agreement—never, under any provocation, to utter a criminatory or harsh word; or if one of the parties in a moment of impatience does speak harshly, let the other reply only in the tone and language of devoted kindness. If they cannot speak in the words of friendship and love, let them for the time being study the virtue of silence. We say if they *cannot*; but it is indeed a lamentable condition of domestic peace when silence is the only means by which disputes and quarreling are to be averted. Husband and wife should converse together much and often; and each should aim to introduce such topics of conversation as are known to be agreeable, and to carry on his or her part of it in such a manner as to please and edify.

There should be no secrets between bosom companions. Each should be frankly let into the wishes and designs of the other. It is a very serious affair to be connected with another person through life for weal or for woe. Too many enter upon such a relation rashly and without due consideration. But when it is entered into, let each party remember well that both he and she have mutual and reciprocal duties to perform, on which depend their success and happiness. Those duties will always be obvious. They will seldom require a prompter when there is a willing mind, resolved on making the best of everything. The circumstances of each day will develop its occurring duties; and if one party is unhappy in the other, let him or her first ask the question, "May not the fault be mine?" and let both bestow attention and care to remove the causes which are seen to contribute to the discontent and uneasiness of the other. In this way, life may avoid a multitude of evils and be rendered comparatively happy.

QUITE A FAMILY.—The late King of Siam had eighty-one children, and he wanted all of them to be educated in English. Mrs. Leonowens says of the Siamese potentate:—"Even the members of his body are specially named, as for instance, his head bears a long, many-syllabled title signifying the sacred, supreme, majestic top. The royal head is a sacred member, and a little prince had his hair all shaved off because he had been contaminated by being patted on the head by his English governess."

Reading for the Young.

BRIEF POEMS FOR BOYS AND GIRLS.

What Makes a Man?

A TRUTHFUL soul, a loving mind;
Full of affection for its kind;
A spirit firm, erect, and free,
That never basely bends a knee;
That will not bend a feather's weight
Of slavery's chance for small or great;
That truly speaks from God within,
That never makes a league with sin;
That snaps the fetters despots make,
And loves the truth for its own sake;
That worships God, and him alone,
And bows no more than at His throne;
And trembles at no tyrant's nod;
A soul that fears no one but God,
And thus can smile at curse or ban—
This is the soul that makes a man.

What Makes a Woman?

Not costly dress nor queenly air;
Not jeweled hand, complexion fair;
Not graceful form nor lofty trend;
Not paint nor curls, nor splendid head;
Not pearly teeth, nor sparkling eyes;
Not voice that nightingale outvies;
Not breath as sweet as eglantine;
Not gaudy gems, nor fabrics fine;
Not all the stores of fashion's mart,
Nor yet the blandishments of art;
Not one, nor all of these combined,
Can make one woman true, refined.
'Tis not the casket that we prize,
But that which in the casket lies!
These outward charms that please the sight
Are naught unless the heart be right.

LETTERS FROM BOYS AND GIRLS.

From a Canada Boy.

MR. EDITOR:—With your permission I would like to say a few words to my Cousins through the columns of your valuable paper. I consider YOUNG TOM'S behavior very rude, and think MINNEHAHA gave him just such a lecture as he deserved, although her remarks concerning the flippant talk of gentlemen are almost too general to suit me. I hope she will withdraw a part of the charge, and not be too severe with us, otherwise I may see fit to take up the cudgel in YOUNG TOM'S favor. I too wonder, with ELLEN J. S., what has become of YOUNG BACH. Has he vanished altogether from the social circle? Come, young man, let yourself be heard; but take my advice, and be a little more guarded in your remarks about the opposite sex, as I will not see them abused any longer without saying something in their favor. The girls have revenged themselves pretty well, I admit, but you deserved *every particle* of it, and I hope it may be a lifelong lesson to you not to ridicule the fair sex again. Now, girls, if YOUNG TOM or BACH see proper to lecture *me*, I shall look for support from you. Will you disappoint me? Our subscription to the RURAL has expired, but we cannot afford to do without it, and will renew soon.—J. M. SHERK, *Sherkston, Ontario, Canada.*

From Virginia Girl.

DEAR EDITOR:—This is my second attempt at writing a letter for your excellent paper, and as you were so kind as to publish my other letter I thought I would try again. My father has taken the RURAL for a long time, and we all feel as if we could not do without it. I enjoy reading the Story Teller and the Boys' and Girls' Column very much. I live in the country and am a farmer's daughter. As most of the boys and girls tell their ages I will tell mine; I will be twelve next month. I don't think that WILD CRAB can have any brothers, because she seems to take the place of a boy. I go to school about one and a-half miles from home and like it very much. Of all my studies I like Geography and Arithmetic best. We have just fifty scholars and a lovely teacher. We have not had any snow until last night, this winter. It has been an exceedingly warm winter so far. Most of the RURAL Cousins have pets. I have but one, and that is my baby brother who is just two years old. I have two brothers and one sister. I think your good paper is scattered far and wide, for I have seen several letters from Canada and California. I must close; so good-by.—SARAH H. SMITH, *Lincoln, Loudoun Co., Va.*

From a Wisconsin Boy.

DEAR MR. EDITOR:—I have been thinking for a long time of writing a letter to the RURAL, but have not succeeded until now. Will you do me a favor by printing my first letter? My father takes your paper and thinks that he could not do without it. I read the Boys' and Girls' Letters and like them very much. We live on a farm thirty miles northwest of Milwaukee, in Wisconsin. I wish, Mr. MOORE, that you and the RURAL Cousins could visit my home. I am quite sure you would pronounce it the prettiest place you ever saw. We are having very queer winter weather for Wisconsin. It has been nearly like spring so far, but it has frozen enough for skating. I go skating nearly every day. I went skating about five miles to-day, and had a nice time. I must now close. From your young friend—FRANK A. S., *Nashotah, Wis., Feb.* 19, 1876.

From a Texas Girl.

DEAR MR. EDITOR:—I read your Premium List for Boys and Girls, and as I am a little girl ten years old, and my papa says the RURAL is a No. 1 paper for any body, I thought I would work a little for it and make something for myself. I succeeded in getting four subscribers at $2.65 each, and send you a Money Order for the same. I would like a good gold pen and ebony holder as my premium. I enjoy reading the letters from the boys and girls, and would like very much to be considered a RURAL Cousin. I send you two of my Cross-word Enigmas.—MATTIE E. SAUNDERS, *Austin, Texas, Feb.* 2.

[The Premium was promptly sent to Miss MATTIE, and her Enigmas will receive attention.—ED.]

From a Connecticut Girl.

MR. EDITOR:—I had never heard of your paper until a few weeks ago a friend of mine came to stay with me and she takes it, and I took quite an interest in the RURAL and the Cousins that write for it, and I think you may well be proud to be the editor of such a splendid paper. I thought I would write one too. My answer to Cross-word Enigma No. 5 is Sweden. I go to school in Danbury, Conn., in No. 10, and my most interesting studies are Music and French. We live in the most fashionable part of the town, in one of the most beautiful places here. I think it is much pleasanter to live in the country with beautiful lawns and pleasant grounds than to live in the city in brown stone houses. I have a splendid little dog for a pet, and his name is "Zip;" he has a bed made for him every day and when we go to bed he goes too, and if any one tries to hurt me "Zip" snaps at them. If this meets with approval perhaps I will write again.—LITTLE DOT, *Danbury, Conn.*

From a Maryland Boy.

DEAR EDITOR:—This is the first time I ever tried to write to the RURAL. I am ten years old. I am going to school. We have about 1½ miles to go to school. I have two brothers younger than myself and one little sister. My brother, eight years of age, goes to school with me. I study Geography, Arithmetic, Reading, Spelling, and Writing. I like to go to school. We have quite a full school for a country school. My father is a farmer and gardener. We have five horses and two cows, some pigs and poultry and one dog. My father has taken the RURAL three years; we like it very much. I think some time I will try and get up a club. I live in Montgomery Co., Md., about six miles northwest of Washington City, D. C. I have been to the Capitol and most of the other public buildings there. If you think this is fit to publish I will write again.—A. E. S., *Montgomery Co., Md.*

From a Western New York Girl.

MR. EDITOR:—I am a little girl ten years old. I have two brothers and one sister. I live on a farm and go to school. I study Monteith's Geography No. 3, Rudiments of Arithmetic, Sanders' Fourth Reader, Writing and Spelling. My father is a farmer and has taken your paper most of the time for twenty-five years and we all like it very much. I have made out the Cross-word Enigma No. 3; the answer is "Lion." [Correct.] This is my first letter to your paper, and if I see this in print I may write again.—ALICE A. MOORE, *Clarkson, Monroe Co., N. Y.*

The Puzzler.

GEOGRAPHICAL ENIGMA.—No. 1.

I AM composed of 60 letters:
My 5, 10, 21, 15, 2, 23, 35, 29, 53 is one of the United States.
My 7, 19, 23, 36, 58, 25, 18, 50 is one of the United States.
My 13, 8, 34, 52, 37 is a State.
My 15, 20, 1, 16, 31, 46, 9 is a State.
My 14, 4, 39, 57, 3, 48, 41 is a State.
My 24, 54, 21, 55, 49, 14, 7, 26, 32, 52 is a city in New York.
My 6, 59, 44, 51, 47, 15 is a river in New York.
My 27, 60, 43, 21, 11, 31, 52 is a city in New Jersey.
My 57, 25, 17, 45, 8, 4, 58 is a city in New York.
My 30, 19, 44, 42, 51, 24, 59, 33, 55 is a city in Pennsylvania.
My 38, 12, 34, 4, 3, 22, 37, 4, 30, 28, 54, 8 is a city in the United States.
My 56, 25, 40, 58, 15 is a lake in the United States.
My whole is a Proverb of Solomon.

☞ Answer in two weeks. J. B. B.

MISCELLANEOUS ENIGMA.—No. 2.

I AM composed of 25 letters:
My 17, 7, 12, 5, 2 is a nymph.
My 3, 4, 6, 8 is a pronoun.
My 10, 23, 15, 21 woman's crown of beauty.
My 14, 11, 9, 19, 16 a mythological river.
My 25, 20, 22, 18, 21 parts of the human body.
My 1, 13 an abbreviation.
My whole is the title of a lovely ballad.

☞ Answer in two weeks. LITTLE ONE.

ARITHMETICAL PUZZLE.—No. 2.

PLACE the numerals, 1 to 9 inclusive, in such form as to make 100.

☞ Answer in two weeks. G.

PUZZLER ANSWERS.—Feb. 19.

MISCELLANEOUS ENIGMA No. 1.—George Washington.

PENAL
ANNUL
CAUSE
ELLEN

CROSS-WORD ENIGMA No. 5.—Sweden.

DOUBLE ACROSTIC No. 2.—Initials, Kepler; finals, Newton.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money in *the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

THE DELAY OF CHEAP POSTAGE.

It looks very much as if the Senate meant to defeat the will of the people in the matter of Cheap Postage. The House of Representatives nearly a month ago passed the bill restoring the rates on all third-class matter. The bill went to the Senate but, instead of passing it promptly, as it should, some Senator moved its reference to the Committee on Post-Offices. Senator HAMLIN of Maine, who is responsible for the original legislation in behalf of the Express Companies, is chairman of this Committee, and since the bill passed into his hands not a word has been heard from it. The trouble is that the Senate is only very slightly amenable to the popular will, and this is one of the weak spots in our Federal Constitution. Senators are elected by State Legislatures and for terms of six years. Senator HAMLIN'S term does not expire till the fourth of March, 1881, and what does he care in the meantime what the people of the country want? Friends of Cheap Postage in the several States should write promptly to their Senators, asking immediate action on the bill, and possibly this may have some effect. The danger is that the Senate Post-Office Committee will patch up the House bill so as to concede all that the Express monopolists desire; but after the decisive and unanimous action of the popular branch of Congress in re-establishing the old rates, we hope that it will stick to its position, even though it involves a conflict with the Senate and the Express Companies combined.

The most impudent of all suggestions is that the Post-Office Department shall be allowed, as a "disinterested" (?) party, to tinker the measure, and that its decision of what the bill should be shall be accepted by both the Senate and the House. We believe that there used to be a provision of the United States Constitution giving the law-making power exclusively to the two houses of Congress. It is a very interesting question whether the "third house," unknown in the Constitution, will dare to thus openly supersede the direct representatives of the people. On this point members of Congress elected directly by and responsible to the people, should make a positive stand. It may prove that on this question of cheap postage which is almost universally demanded by the people, will hinge the yet more important question of the duty of the Government to promptly respond to the popular will. Certainly in monarchical England even, such a demand as now arises for a restoration of cheap postage could not remain unheeded. Any administration denying or ignoring it would go out of power in less than a month.

HOME NEWS PARAGRAPHS.

In Maine $999,000 are invested in porgy "factories," which employ 1,234 men, 36 steamers, and 37 sailing vessels. Last year 712,000 barrels of fish were taken and 1,500,000 gallons of oil and 22,000 tons of guano were made. Fourteen steamers were also added to the fleet, and 15,000 barrels of fish were sold for bait.

At midnight, Feb. 22, a fire started in the rear of Hammill's stables in Main St., Tarrytown, N. Y., and swept the entire block. The losses are estimated at about $37,000. The fire is supposed to have originated from the pipe of a tramp, who had entered Hammill's stable to sleep.

A dispatch dated Springfield, Dakotah, Feb. 24, says:—Wagon trains of every description are constantly passing here, bound for the gold fields. The different parties as they pass along have from two to twenty-five wagons each. One party camped in town last night, and one could see camp fires of three other trains on the prairie west of here. Another Springfield party will start at noon to-day, consisting of seven wagons and twenty men. In this party are some of the best business men of this town, and they have better teams and outfits generally than any who have yet left here. The party is jubilant, and will be in the Hills in a few days.

Three men were shot in a row at Guadaloupe, Cal., recently, and one of them refused to stop dancing until a physician arrived, and then only long enough to have the bullet extracted from his back, when, upon trying to dance again, he fell and expired.

John Laight, aged 73, and Sarah Coons, aged 70, were married in Somerset, Ky., lately. They had been husband and wife in 1848, but had quarreled and been divorced, and subsequently each had been married twice.

An Albany ice firm applied to the Shakers, wishing to purchase the ice on a small lake. The Shakers declared it to be against their principles to sell water, air or ice, and gave permission to cut it free. Three hundred teams and 400 men are thus given employment.

The Prohibition State Convention met at the State House in Providence, R. I., Feb. 22. Most of the towns were represented. B. Chadsey of North Kingstown was elected President. The following nominations for State officers were made by the Convention: For Governor—Albert C. Howard of East Providence. Lieut. Gov.—Alfred C. Chadsey of North Kingstown. Secretary of State—Joshua M. Addeman of Providence. Attorney General—Warren B. Peirce of Providence. General Treasurer—A. D. Vose of Woonsocket.

The steamer City of Quincy, from New Orleans for St. Louis, sunk on the night of Feb. 20th, five miles below Memphis. Her cargo of 450 tons of sugar will prove a total loss. No lives were lost. The boat will probably be a total loss.

While two men were the other day fishing for shad with a seine in Lake Monroe, Florida, they drew in an alligator six and a half feet long.

William S. Parsons, a child who lived at East Seventeenth street, N. Y. City, died recently of fright on being told that a dose of poison had been given him by mistake. His father got up in the darkness of the early morning to administer some medicine as directed by the attending physician, but picked up a bottle of aconite by mistake. He did not notice the mistake until the child had taken the dose. He cried out to his son that he was poisoned and the boy went into convulsions, which ended in his death.

The Ohio Assembly has passed the Senate bill authorizing the issue of $6,000,000 of bonds to complete the Cincinnati Southern Railroad, with an amendment providing that the question shall first be submitted to a vote of the people within thirty days from the passage of the bill.

Late on Wednesday night Feb. 23d a fire in Le Mars, Iowa, destroyed a large building occupied by four families. A woman and three small children were burned in the ruins, and when found were burned to a cinder. The husband is now a raving maniac.

The Blue Ridge "Blade," a North Carolina newspaper, mentions the death from diphtheria recently of eight persons out of one family in Caldwell county in that State.

A rival of Tom Thumb has appeared in Binghamton, N. Y., in the person of a boy five years old, who weighs nine pounds when fully dressed, is twenty-three inches in hight, is physically perfect and healthy, and who talks very distinctly. The child weighed but two and a half pounds at birth, and has not grown since he was a few months old.

Great numbers of codfish have been taken during the winter off the southern coast of New Jersey. A great school chased by porpoises passed Cape May one day last week, and a party of fishermen which put out from the Delaware breakwater succeeded in catching nine hundred pounds in a few hours.

The trial of Gen. O. E. Babcock, private secretary of the President, for complicity in whisky frauds which has been in progress several days in St. Louis has resulted in his acquittal. The fact was the occasion of many warm congratulations by the General's personal friends. It is now said that Gen. Babcock will retire from his position as the President's secretary, but will remain as Supt. of Public Buildings at Washington.

Prof. Peters of Ann Arbor, Mich., announces the discovery of a planet of the eleventh magnitude in 10 degs. 16 min., right ascension and 14 deg. 32 min. declination, with a daily motion of 4 deg.

The Delaware, Lackwanna and Western Railroad Company has decided on narrowing the gauge all along the road. The work will be begun forwith in the Company's car and machine shops at Scranton. The proposed change will require the narrowing of the gauge along 600 miles of road, the building of 4,000 new freight and coal cars, and the alteration of the 12,000 coal cars now in use.

The Grand Jury has brought in three indictments against ex-County Treasurer Henry A. Mann of Ballston Spa, each charging him with forgery in the the third degree. He gave bail in the amount of $10,000.

By advice of the Bishop, a burial is denied to Waltz, the murderer, in the Catholic cemetery at Catskill, for the present.

It was the American whaler Young Phœnix of New Bedford that rescued 41 of the survivors of the emigrant ship Strathmore. She took them aboard on the 22d of January, and on the 26th of that month transferred 20 of them to the Sierra Morena. The latter vessel, which has arrived at Galle and landed the unfortunates, reports the above details.

Retrenchment has at last pushed its way into the councils of Congress, and a reduction of salaries in both Houses is said to be imminent. If they carry out the project, the members will gain in popularity what they lose in cash.

Gov. Ames has been impeached by the Mississippi House.

Owing to speculation in rooms at Cincinnati hotels, the change of place of the Republican Convention is proposed.

The Delaware, Lackawanna and Western Railroad Company has decided to adopt the standard gauge.

Gov. Tilden testified in the trial of the civil suit against Tweed.

An Englishman predicted twenty years ago that if gutta-percha be used for sub-marine telegraphic purposes, an animal with a special appetite for that substance would be found or created. The Popular Science Monthly now tells us that the anticipated destroyer has appeared; and that he is about a quarter of an inch in length. The frequent interruptions of cable communications are ascribed by the writer to the propensity of this diminutive creature to take his meals out of gutta-percha. Should this theory be fully established, invention will have to cast about for some means to outwit this new enemy of civilization.

The annual report of the Chicago, Burlington & Quincy railroad shows a surplus of $415,000.

The reunion of the Army of the Potomac will be held on the sixth of June, in Philadelphia.

The Sumiatt paper mill at Rigua, Ohio, owned by William Wall, is burned. Loss, $20,000; Insurance, $10,000.

Besides Yale, Bowdoin, Trinity, Amherst and Williams have withdrawn from the College Rowing Association, and it is intimated that Dartmouth will follow.

The revival meetings conducted by Mr. Hammond at Washington, D. C., are daily increasing in interest. Between 5,000 and 6,000 persons profess to have been converted. Two Jews are among the converted and have related their experience.

Harrison Parkman, the veteran canal boat revivalist of Weehawken, who is locked up on the charge of assault in ejecting a noisy sinner from one of the revival gatherings, is holding prayer meetings in the Hudson county jail. On Feb. 26th he delivered a sermon on "Faith" to the prisoners.

Joel Sammitt, brother-in-law of Rubenstein, has been arrested at Brooklyn for perjury.

Prof. Silliman of Yale College, has discovered a chemical process by which German silver and brittannia can be made to ring like gold and silver.

FOREIGN NOTES.

In the time of Charles II. tobacco was supposed to be a mighty antidote to the plague, and Hearne says, when at Eton, the worst floggings the students ever received were because they refused to smoke.

The following has been published at Berlin as a warning against emigration:—The German Minister at Washington was recently asked to interfere in behalf of Germans living in Louisiana who, it was alleged, were maltreated by the Ku-Klux. The Minister could do nothing.

The Americans who are exploring Palestine have just concluded a successful tour east of the Jordan. The members were surprised by the number of the ruins of Christian churches, many standing side by side with heathen temples.

A magnificent cameo, supposed to be a portrait of Octavia, the second wife of Mark Antony and sister of Augustus, has been brought to the notice of the Paris Academie des Inscriptions. The stone is a sardonyx, with a milky surface.

In Manchester, England, the other day, two fine horses attached to a brougham took fright, dashed through a restaurant window, and forced their way to the middle of the room. They were badly cut, and the damage altogether is estimated at £200 to £300.

A Birmingham coach-builder named Thomas claims the Whaddon Hall estates, Buckinghamshire, England, which, with accumulated money, exceed in value three millions sterling. The Birmingham claimant has not been able to carry on an action before owing to want of funds, but several gentlemen afterward offered pecuniary aid on the particulars of the claim appearing in a local paper. The matter is to be placed in the hands of solicitors, who will be instructed to take immediate action for the recovery of the valuable property.

A curious illustration of the nonchalance and carelessness of Parisians is afforded by the returns of the "Found Property" Department in the French metropolis. Of 3,684 objects and valuables found in 1875 only 441 have been claimed by and returned to the legitimate owners, and there remain unclaimed numerous articles of valuable jewelry, watches, bracelets, and portemonnaies containing large sums of money in small notes, as well as 100 franc and even 500 franc bank notes.

A single manufacturer of perfumery at Cannes, France, uses annually 140,000 pounds of orange blossoms, 129,000 pounds of acacia flowers, 140,000 pounds of rose leaves, 32,000 pounds of violets, 8,000 pounds of tuberoses, and rosemary, mint, thyme, lemons, and citrons in proportionate quantities. Nice and Cannes together consume annually over 20 tons of violets, and Nice alone 130 tons of orange blossoms.

A twenty-five cent pamphlet, full of thinly-disguised abuse of the royal family of England, has attained in London a circulation of over 120,000 copies. A correspondent writes:—"It is as near treason as the author dare come for a shilling."

A dispatch from Havana, Feb. 24, says:—Mail advices from San Domingo announce that President Gonzales, on the 5th ult., was marching with an army toward Puerto Plata, which city is held by the insurgents under Luperon. Another report says that Gonzales is returning to the capital by way of Samana. The future is altogether a matter of speculation. There have been several bloody encounters between the factions. A public meeting was held at San Domingo on the 9th, at which a commission was appointed to go out and meet Gonzales and request him to disband his command peacefully, in order to prevent any further calamities.

The Italian lotteries are a source of great revenue to Victor Emanuel's Government. In one year various speculators deposited $15,000,000 in the public treasury, and the sums paid out in prizes, &c., did not amount to more than $10,000,000, so that the Government netted $5,000,000.

Garibaldi receives visitors in an arm-chair. He is supported by pillows, and is incapable of moving without crutches. The fingers of both hands are stiffened into utter rigidity, with the exception of the thumbs. His face, however, bears the hue of health, and his mind remains as vigorous as ever.

The Russian troops under Gen. Scobelef entered Khokand on the 22nd ult., and were warmly welcomed by the inhabitants, who expressed great satisfaction at the announcement of the incorporation of Khokand with Russia.

In England and Wales there are now one Roman Catholic cardinal archbishop, one archbishop *in partibus*, 16 bishops, 1,772 priests, and 1,061 churches and chapels, which shows an increase during the past year of 52 priests and 20 places of worship.

The British Admiralty have ordered the construction of two dispatch vessels to be made entirely of steel.

Gen. Chanzy, Governor-General of Algeria, reports that the organization of a sanitary service has been completed all over that country, which has a larger area than Great Britain.

The head of the Scottish house of Murray, generally known as the Duke of Athole, a young man of thirty-six holds one dukedom, two marquisates, five earldoms, three titles as viscount and twelve as baron, twenty-three titles in all; six more than any other nobleman in the United Kingdom.

The riots at Workshop, Eng., Feb. 24 on the occasion of the election, were caused by a gang of operatives from a neighboring colliery. No serious damage was done, and all is quiet now.

It is said that Spain has agreed to pay an indemnity to the family of M. Reygondeau, who was executed in Cuba, and to court martial the officer who ordered the execution.

The election in Victoria, N. L., resulted in the return of Mr. Elliott, new premier, by a majority of one hundred and sixty-three. The vote was the largest ever cast in the city. The election was quiet.

It is said that the appointment of Count De Stalberg-Wernigerode to the Vienna ambassadorship has made such an impression that Prince Bismarck would appear to regard him as a successor to the chancellorship.

THE SEASON, CROPS, PRICES, ETC.

Stony Ridge, Surry Co., N. C., Feb. 15,—An exceedingly mild winter so far. Raining now, and the water courses up. Wheat looking well; a plenty of corn for home consumption, and a large crop of tobacco for sale. This about expresses the present status of our section.—N. A. W.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 26, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	59,001	Rice, bbls.	1,116
Whisky	3,101	Cut meats, pkgs.	17,907
Corn meal, bbls	2,676	Lard, pkgs.	8,865
Corn meal, bags	4,505	Tar, bbls.	—
Wheat, bush	95,522	Tobacco, hhds	1,845
Corn, bush	382,612	do. cases	3,604
Oats, bush	139,180	Butter, lbs.	17,451
Rye, bush	224	Cheese, bxs.	9,546
Malt, bush	51,828	Cotton, bales	20,403
Barley, bush	62,500	Rosin	5,778
Beans, bbls	7,286	Sats. Turp., bbls.	1,079
Grass seed, bags	5,676	Dried Fruits, pkgs.	418
Beef, pkgs.	108	Eggs, bbls.	10,183
Wool, bales	667	Peanuts, bags	687
Hops, bales	1,761	Dressed Hogs	2,460
Pork, bbls	1,480	Oil Cake, pkgs.	
Tallow	1,131	Leather, sides	73,131
Molasses	1,622	Sugar	130

BEANS AND PEAS.—Exports of beans past week, 1,101 bush.; since Jan. 1st, 9,218; do.; same time last year, 2,365 do. Exports of peas past week, 2,456 bush.; since Jan. 1st, 183,077 do.; same time last year, 41,004 do. There is merely the same weak story for medium beans. The best in store are not quoted above $1.45, and, as before the late arrivals, are of the low-priced order. A continued active export demand for marrows has run down the stock to some extent, but they are only fairly firm. In kidneys we hear of only a light demand for red or white. Pea beans quiet. Limas weak and low. Canadian peas, both bulk, in bond and bbls. free of duty, quoted easy.

Wholesale prices: pea, new, prime, $1.45@1.40; other, 1.15@1.25; medium, new, $1.35@1.40; fair to good, $1.15@1.30; very poor, 50@90c.; marrow, new, prime, $1.75@1.80; other, $1.45@1.65; white kidney, prime, $1.75@1.85; fair to good, $1.50@1.70; red kidney, new, prime, $1.50@1.60, fair to good, $1.30@1.45; California Lima, choice, $2.75@3.00. Peas, Canadian, bbls., new duty paid, $1.15@1.20; bulk, in bond, $1.00; green new, ⅘ bush., $1.60; Southern B. E., ⅘ bush. bag, $2.90@3.

BEESWAX.—The market is fairly active for pure at 30@31c. for Western and 32@33c. for Southern. Exports since Jan. 1st, 20,311 lbs.; same time last year, 7,705 do.

BROOM CORN.—It looks as if we would soon run entirely out of fine grades. The few lots that show are eagerly taken at high rates. Ordinary, or such as is in stock, quoted at 9@10c. for brush, 8½@10c. for hurl, 5@7c. for medium, and 3@4c. for red and tipped. The two latter grades form the chief supply.

BUTTER.—Arrivals have been quite liberal latterly but they are of a grade that ought to have been here

when trade was more buoyant than it now is. Business for the past week shows a great improvement over that of the previous one; but we are on the eve of a spring month and with the quantities of undergrades yet to be moved, dealers dare not ask better rates than have ruled. We are speaking of 25@28c. State stock and at that range, with an enlarged offering buyers are really making better bargains than before. Fine butter is a thing of itself and will likely rule as high as it does until first grass. With spring almost upon us it is rather late for suggestions, but we are forced to remark there is now only one thing for State owners to do: that is let stock come right along and take its chance of being sustained at present rates. Many have held back unprofitably already by giving a fictitious home rate to quality. It seems to take a good many seasons for some dairymen to realize that the distributing point is the actual locality to decide grades, and until some settled science enables producers to make a uniform high grade they will be compelled to depend upon the comparisons that are inevitable in a crop depending upon a wholesale outlet. It might be stated incidentally that the past season has been an unusually perplexed one in its surroundings, baffling the judgement of almost every one in the trade. The crop fell short of its fall yield of fine, a wet summer spoiled or deteriorated often portions, while credit has been shaky to an extent that not only paralyzed ordinary speculative energy, but also reduced the transactions with actual consumers. Thus far, best dealers think that in the order of things butter has had a fair share of prosperity, and that the point should be to run the remnant into grass as fast as the unfavorable season permits. Western butter keeps in pretty steady position; the supply is not large and very cheap, buyers find what they want at satisfactory figures. Rolls are still active and close firm.

State dairies entire, extra, 32@33c.; entire, good to prime, 29@31c.; fair to good, 25@28c; firkins, selected fresh, 30@33c.; good to prime, 27@29c.; fair to good, 24@27c.; half-firkin tubs, selected, 35@38c.; good to prime, 32@34c.; fair to good, 28@32c.; poor to fair, 26@27c.; State, Welsh, tubs, fall made, 31@33c.; dairies, 25@30c.; good to prime, 23@25c.; fair to good, 21@23c.; poor to fair, 17@20c.; Pennsylvania, store packed, 19@21c.; Western, dairy tubs, selected, 25@29c.; good to prime, 23@24c., tubs selected fresh, 26@27c.; good to prime, fresh, 23@25c.; fair to good, fresh, 18@22c.; poor to fair, fresh, 16@18c.; Western, early packed, selected, 18@20c.; Western, early packed, other, 14@18c. Roll butter, good to prime, 21@23c.; fair to good, 19@21c., common, 17@19c. Fancy Mich. Rolls, 25@26c.

CHEESE.—The export movement is still moderate and the home trade light. Fancy factories bring 13¾@14c, with the shipping demand almost entirely for this class of stock. Local demand is chiefly for South at about 11@12c.

New State factory, fancy, 13¾@14c.; fine, 13c.; do. good to prime, 11¾@12½c.; fair to good, 10@11¾c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12½c.; good to prime, 10¾@11½c.; fair to good, 9½@10¾c. Western factory, cheddar, fine, 12@12½c.; good to prime, 11@12c; flat fine, 12½@13c; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c; pineapple, 16@18c. English dairy, Connecticut, 13@13½c, do. State, 16@18c.

COTTON.—There has been a sharp decline in prices through a slow export trade, and larger supplies than had been expected. The closing prices are for February, 12¾c.; March, 12 17-32c; April, 12¾c.; May, 13 5-32@13 3-16c.; June, 13 13-32@13 7-16c.; July, 13 21 32@13 11-16c.; August, 13 25-32@13 13-16c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9 3-16	9 5-16	9 3-16	9 3-16
Strict ordinary	10 1-16	10 1-16	10 1-16	10 1-16
Good ordinary	10 11-16	10 11-16	10 13-16	10 15-16
Strict good do	11 7-16	10 7-16	11 9-16	11 9-16
Low middling	11 15-16	12 1-16	13 3-16	13 3-16
Strict low middling	12 7-16	12 3-16	12 11-16	12 11-16
Middling	12¾	12¾	12 15-16	12 15-16
Good middling	13¼	13¼	13⅝	13⅝
Strict good middling	13⅝	13⅝	13¾	13¾
Middling fair	14	14¼	14¾	14¾
Fair	14¾	15	15⅛	15⅛

DOMESTIC DRIED FRUITS.—In apples there is a light jobbing movement at about steady prices. Peeled peaches in small stock and firm; unpeeled do. scarce and held as before. Blackberries are lower at the West than here, and are dull.

Apples—State, sliced, 10@10¾c.; quarters, 9@9¼c; Western quarters, 8¾c.; Southern sliced, 1875 cr'op, 10@10¾c. for prime. Tennessee qrs., 8¾@8½c. Blackberries, new, 11½ @ c. Peeled peaches, good and prime Georgia, 14@15c.; do. fancy, 18c. Unpeeled peaches, new, 12@12½c. for halves, and 10@11c. for quarters. Plums, 20c. Raspberries, 27c. Cherries, 21@22c. Peaches peeled, new process, 20@23c.; do. unpeeled, 12@13c.

FLOUR.—The markets abroad have been in unsatisfactory shape, and there have been but light requirements for export. This, in connection with a limited home business and liberal supplies, have tended to the lower rates.

Superfine State, $4.25@4.60; extra do., $4.60@5.00; superfine Western, (4.25@4.60; extra do., $4.30@5.05; No. 2, $3.25@4.00 extra round-hoop Ohio, $4.30@5 25] trade brands do., $5.30@7.25; wh at wheat extras, $5 80@7.00; St. Louis, $5.25@9.00; City Mills extra, $5 00@6.50. Southern at $4.25@4.65 for superfine; $4.30@6.25 for poor to choice shipping extras; $5.30@8.75 for trade and family brands. Rye, $4.10@5.05. Corn meal—Western yellow, $2.70@3.25; do. white, $2.70@3.25; Jersey & Penn., $2.90@3.25. Buckwheat selling at 60@61c. for prime State, and flour at $1.85@2.35.

EGGS.—Low prices have produced a very free consumption of eggs, and this is certainly a favorable feature. Lent will of course call for a steadier trade, but it is not to ought that we will have marked high prices while the supplies are so unprecedentedly liberal. A few cold days latterly have given some strength to best marks, but old, speculatively-held parcels are quite a drag. Limed are down to 10c., with sales at the mark. We quote:

Jersey, single barrels, ₱ bbl., 24c.; State & Penn., 21@22c.; Western, prime, 21c.; fair marks, 18@20c.; Southern and South Western, 19@20½c.

ESSENTIAL OILS.—Wholesale trade is flat. The quotations for such lots as are running are as follows:—U. S. oil peppermint, $1, in glass; Hall & Parshall do., $1@1.20 do.; pure in tin, $3 50; sassafras, 55c.; wintergreen, $3.12; spearmint, $3 50; pennyroyal, $1.

FEATHERS.—Prime Western live geese quoted at 58@60c.; mixed, 30@45c.

FRESH FRUITS.—Exports of apples past week, 670 bbls.; since Jan. 1st, 3,681 do.; same time last year, 8,451 do. There is a pretty fair demand for apples. Stock has been sorted pretty generally and prime table fruit is firmer, or brings the extreme more readily. California pound pears, coming from Chicago, are quoted at $4@4.50 per box. Cranberries are scarce and firm at the new figures. Florida oranges scarce. Peanuts rule easy. Pecans unchanged. Hickory nuts no longer inquired for.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; other $1.50@2. Cranberries—Jersey, choice, bush. crates, full measure, $1.50@4.50; good to prime, $1; made bbls., $12.50@13.50. Nuts—Peanuts, Virginia, $1.40@1.55; do. Wilmington, $1.75@1.80; do. Tennessee, 75@90c. Black walnuts, 50c. Pecans, 12@13c.

FURS AND SKINS.—Next month will bring further European quotations, and until the March sales take place prices here will rule more or less nominal. Furriers intend to make a creditable show at the Centennial Exhibition. Few are aware how marked an advance has been made in this country in the preparation of furs for garment-trimming and hat purposes. We quote prime skins:

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50

Cat, Wild, Southern and Western	40 to 50
Fisher, Northern and Eastern	7 00 to 12 00
Fisher, Southern and Western	3 00 to 8 00
Fox, silver	15 00 to 50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00 to 5 00
Fox, Red, Northern and Eastern, according to size and color	1 50 to 1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25 to 1 50
Fox, Red, Southern and Western	75 to 1 00
Fox, Gray, North and Eastern, cased	75 to 1 00
Fox, Gray, South and West	40 to 60
Fox, Kitt	30 to 50
Lynx	1 00 to 2 00
Marten, Stone	1 50 to 2 00
Mink, New York and New England	3 00 to 4 00
Mink, Can., Mich., and Minn	2 00 to 3 00
Mink, New Jersey, Pennsylvania, and Ohio	1 00 to 1 50
Mink, Maryland, Virginia, Kentucky, Indiana, Wisconsin and Iowa	75 to 1 25
Missouri and all Southern	50 to 75
Muskrat, N. and East'n, fall & winter	25 to 27
Muskrat, West, including Penn. and Ohio, winter	22 to 25
Muskrat, Southern prime winter and fall	12 to 20
Otter, North'n and Eastern and North-West	10 00 to 12 00
Otter, Penn., N. J., Ohio and Western	6 00 to 10 00
Otter, South Carolina and Georgia	2 00 to 6 00
Opossum, North, cased	18 to 20
Opossum, South and open North	12 to 15
Raccon, Mich., N. Ind., N. Ohio, Indiana handled, dark	80 to 1 00
Raccon, Ill., Iowa, Wis, and Minn	50 to 65
Raccon, N. Y. and E. States & N. Penn.	65 to 75
Raccon, N. J., S. Penn., Ind., Ill., Mo., Neb, and Kan	40 to 50
Raccon, Md., Va., Ky., Tenn., N. and S. Car., Geo., Ark., Fla. and Ala	15 to 40
Rabbits, prime, cased	2 00 to 3 00
Sheep skins, summer and fall	50 to 1 00
Sheep skins, winter	1 50 to 2 00
Skunks, prime black, No. 1, cased	— to 1 50
Skunks, prime black, No. 1, open	— to 1 00
Skunks, prime one-half white streak	50 to 80
Skunks, whole streaked	15 to 20
Wolf Skins, mountain, large	2 00 to 3 00
Wolf Skins, prairie, prime	75 to 1 25

GINSENG. Western $130@125; Southern $125@130.

GRAIN.—Foreign advices have been tame for wheat, prices for which are lower, with the poor grades offering most freely. Sales at $1.03@1.15 for ungraded spring; $1.47 for choice amber Pennsylvania; $1.30 for choice old No. 2 Milwaukee spring; $1.21 for No. 2 Northwest spring in store; $1.10 for No. 3 Milwaukee spring afloat; $1.05 for "no grade" red winter in store; $1.22@1.26 for No. 2 spring; $1.30 @1.47 for winter red and amber; $1.45@1.50 for white, and $1.32@1.36 for No. 1 spring. Rye at 83@91c. for State, and 85@88c. for Western. Barley about steady in price; No. 2 Canada sold at $1.10. Barley malt at $1.12½@1.15 for Canada, as to quality, 85c.@$1.07½ for two-rowed State. Corn is in large supply, but has a fair export demand and rules strong as to price. Latest sales are 64c. for mixed Western, New York inspection; 64@64¼c. for ungraded mixed Western; 60@61c. for "no grade," new mixed; 61@64½c. for new yellow Western; 64½@65½c. for new yellow Southern; 61@62½c. for poor to very good new yellow Western. Oats are in very good demand and steady in price. Sales at 48c. for New York light mixed; 45½@46c. for No. 3 New York; 46@48½c. for mixed Western; 47@52½c. for white Western State.

HAY AND STRAW are in small receipt and bring full prices. Exports past week, 590 bales; since Jan. 1st, 5,008 do.; same time last year, 6,001 do.

Bale hay is quoted:—Shipping, 75@80c.; retail qualities, 85c.@1.10; clover, 65@75c.; salt, 65@75c. Straw is quoted at $1.05@1.15 for long rye; 80@85c. for short rye; 75@80c. for oat.

Exports past week, 736 bales; since Jan. 1st, 1,418 bales; same time last year, 5,588.

HIGHWINES.—Selling at $1.10.

HONEY.—Scarcely quotable, owing to the very light demand. A buying range would be 15@22c. for good to best comb.

HOPS.—A large trade has been doing this week. Sixteen and seventeen cents has been freely paid for choice goods, though very few have been on offer, as holders feel confident that more money will be realized for this class within a short time, owing to the scarcity. Seconds and mediums have received considerable attention from brewers, and for this class 12½@13c. has been the ruling price. The total exports for the season from this port now reach 36,000 bales. It is believed that we have yet to spare 10,000, the shipment of 10,000 bales more, will be likely to run the price up to 20 cents and over.

New York State, 12@17c.; Eastern, 10@15c.; Wisconsins, 10@15c; Yearlings, 8@10c.; Olds, all growths, 7@9c.; California, 17@20c.

OIL CAKE.—Western is in large supply, and offered at $42.50.

POULTRY AND GAME.—It has not been much of a season for dressed poultry. The losses have not been so heavy as for some former seasons, but business has been slack and there was little inducement to ship stock at the period when trade ought to have been regular. For the moderate supplies of prime prices have ruled good. Parcels out of order have no settled rates.

Chickens, Bucks Co., good to prime, 19@20c.; Jersey, good to prime, 17@19c.; State, good to prime, 15@18c.; Western, good to prime, 14@15c.; fair to good, 12@14c.; poor, 9@11c. Turkeys, Jersey, good to prime, 19@20c; State, good to prime, 17@19c.; Western, good to prime, 16@18c.; inferior, 11@13c. Ducks, Jersey, good to prime, 20@22c.; State, good to prime, 19@21c.; Western, good to prime, 18@20c.; fair to good, 15@16c.; poor, 13@15c. Geese, Jersey, prime, 12@14c.; State, good to prime, 11@13c. Capons, 25@28c. Slips, Western, 18@19c.

Live poultry is brisk; the winding up of the game season helps both live and dressed poultry materially. We quote:

Turkeys, Jersey, ₱ lb., 15@16c.; do. Western, 11@15c.; Geese, Jersey, ₱ pair, $2.50@3; do, Western, $1.50@1.75; ducks, Western, ₱ lb., 65@75c.; ducks, Jersey, ₱ pair, $1@1.25; fowls and chickens, State and Jersey, ₱ lb., 15@16c.; do. Western, 14@15c.; roosters-8@10c.

In game we quote the few items that will be lawful by the time this paper is sent out:

Wild pigeons, feathered, per doz., $2@2.50. Canvas back ducks ₱ pair, $1.50@2; Mallard, 75c.@$1; Redhead, $1 25.

The closing rates for Quail were $3.75@4 for grouse, 87c. for poor, and $1.50 for prime.

PROVISIONS.—Export trade has been light generally and easier prices have been accepted. Mess pork quoted at $22.25@22.50 for cash and March; $22.50 for May; $23.65 for June; extra prime on the spot, $18.50, and prime mess, $21.25. Dressed hogs at 10¾c. for Western. Western the cest pickled hams, 13@13¾c. Boxed dry-salted shoulders, 9¼c. Bacon at 12c. for Western long clear; 12¾c. for short clear, and 12¾c. for long and short clear, together. Lard—Western steam at 13-30c. for cash, 13-32¼c for March; 13-42½c. for April; 13-57½@13-60c. for May; 13.67½@13-72½c. for June. Stearine at 13¾@11c. Tallow at 9 5-16c. for prime. Beef hams at $24@26. Beef—New extra mess at $12@@13; do. plain mess, $11.50; new tierced at $23 for prime mess, and $25 for India mess. City extra India mess, $32@32.50 Old extra mess, $11.50; 10.50 for plain mess; packet, $15.10@16.

RICE.—Carolina quoted 6¾@6¾c. for fair; 6¾@6¾c. for good; 7@7¼c. for prime and choice up to 7½c.

SEED.—Clover is again better, with a larger export trade. Sales at 13¾@14c. for State; 13¾c. for Western, and 13¾@13¾c. for Canada.

TOBACCO.—For Kentucky leaf, with larger arrivals, prices are reduced. Seedleaf is unchanged.

KENTUCKY LEAF.	Light. Cents.	Heavy. Cents.

VEGETABLES.—Exports of potatoes past week 4,620 bbls.; since Jan. 1st 42,015 do.; same time last year, 21,209 do. There has been a fair shipping trade in potatoes; beyond that there is little life in the market. Poor sorts are not looked at, while the best are quoted at $1.50 ₱ bbl. in bulk. The warm weather has affected onions and only strictly sound bring outside prices. Bermuda produce will now arrive regularly, opening considerably earlier than for several former years.

Early Rose, bulk, ₱ bbl., $1.00@1.37; Peach Blows, $1.37@1.50; Prince Alberts, $1.00@1.25; Peerless, 85c.@$1.00. Sweet potatoes, $1.50@3.10. Cabbages, ₱ 100, $3 @5; red, $6@10. Squash, Marrow, bbl., 50@75c.; Hubbard, $1 25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1 75; white, $2.50@3.00. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00. Baltimore spinach, ₱ bbl., $1.50@2.

WOOL.—The week's business has been light; fine Western fleeces are held firmly, but occasional sales of the poorer grades are at easier prices, with holders as a rule, in consideration of the moderate stock, indisposed to make concessions. Combing and delaine are well sustained in price, although for the market trade is light. California parcels are offering freely, and a freer business results in this class of stocks. Pulled are quiet; common lots easier in price, but choice lots bring full rates.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Feb. 21, 1876.

TRANSACTIONS in cheese are light this week and confined to medium and lower grades. The factories holding fine Septembers and Octobers are asking 14c., which is above the views of buyers. Some farm dairies are held above current rates. The market is very firm, but our quotations do not vary materially from last week. Late ends of factories may be quoted at 10@12c. and farm dairies 9@10c., according to quality.

Winter butter sells at 24@26c. Small parcels of new milk butter begin to be made which are taken for home consumption, and the quantity is too small to quote.

We have advices from Europe to the second week in January. Our London correspondent says:

An active market and more doing in American cheese, especially for very fine sorts, which are in small compass. Medium and low grades wanted if in good condition. Fine English cheese is very scarce. The prices are as follows:

American extra, 65s@66s.; fine, 63@64s.; good 59@63s.; common, 35@42s. English cheddar brings 80@98s.; Wiltshire double, 62@66s.; Cheshire medium, 46@52s.; fine, 70@80s.; Scotch, 70@78s., and Edams at 70s. ₱ cwt.

Fine butter is very scarce and there is an improved demand for secondary American and the substitutes.

Jersey sells for 136s.; Dorsets, 166s.; Danish and Swedish, 150s.; Normandy salt, 100@174s.; American and Canadian, 90@120s. ₱ cwt.

Oleomargarine or artificial butter brings 100@110s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Feb. 25, 1876.

RECEIPTS OF LIVE STOCK.

PERSONAL ITEMS.

WASHINGTON'S birthday was widely celebrated.

SENATOR LOGAN'S wife is seriously ill in Washington.

THE Wisconsin Republicans favor Blaine for the Presidency.

GOV. CHENCY of New Hampshire is said to be seriously ill.

MISS CHARLOTTE CUSHMAN left a fortune estimated at $600,000.

GEORGE PECK, a prominent business man of Rochester, N. Y., died Feb. 21, aged 60.

PROFESSOR GILMAN has been inaugurated President of the Johns Hopkins University at Baltimore.

PAUL BUTLER, son of Gen. B. F. Butler, is said to be one of the promtnent beaux in Washington this winter.

GEN. GARFIELD has been invited to address the Williams College literary societies at the next commencement.

GEROME, the French artist, got $30,000 from A. T. Stewart of New York for his new picture, "A Roman Chariot Race."

IT NOW seems that the Mrs. Green who lost her life in the Strath-Clyde disaster was the niece and not the daughter of Dion Boucicault.

PROF. GOLDWIN SMITH has resigned his position as a member of the Senate of Toronto University on account of other pressing business.

AN interesting lawsuit about Miss Thompson's picture, the "Roll Call," revealed the fact that the lady only received $500 for this work.

A SMALL, dilapidated building is allowed to stand in front of a fine residence in Petersburg, Va., because Andrew Jackson studied law in it.

THE marriage of Mr. James Gordon Bennett to Miss Ida May of Boston, it is announced, will take place on the 18th of April, in Grace Church, Boston.

A MONUMENT to the late Thomas Barry, actor, to cost $1,000, is to be erected in Forest Hill Cemetery, Boston, Mass., and subscriptions will be opened to raise the amount.

MADAME CHRISTINE NILSSON has been compelled to relinquish her engagements and go to Nice with her husband, who is suffering from an acute attack of bronchitis.

MISS GARRISON and Mrs. Cedarholm are preaching in Sherman, Texas, with great success. They are Methodists, and the first women preachers in the State of Texas.

AN Italian marble monument, bearing a life-like medallion portrait of Clement L. Vallandigham, was placed over his grave in Woodland Cemetery, at Dayton, Ohio, recently.

HEREAFTER the Justices of the Supreme Court of the Dominion of Canada will wear robes of scarlet and black, trimmed with ermine, similar to those worn at Westminster Hall.

PRINCESS FREDERICKA, daughter of the blind ex-King of Hanover, is said to be the most beautiful princess in Europe. She is the devoted and constant companion of her father.

AT a temperance meeting in London recently a vote of welcome to "Mother Stewart," the leader in the Ohio woman's whisky war, was moved by Mrs. Lucas, a sister of John Bright.

MR. FRANKLIN B. DEXTER, Secretary of Yale College, read a paper on the early history of that institution before the Historical Society of New Haven on the evening of the 14th inst.

THE Rev. Dr. Behrends of Cleveland, Ohio, who seceded from the Baptist denomination recently, has been called to the pastorate of the Union Congregational Church of Providence, R. I.

MR. VALENTINE, the sculptor, has finished the recumbent statue of Robert E. Lee, and it will soon be placed in a suitable structure above the Confederate leader's grave at Lexington, Va.

THE daughters of Sir Edward Thornton, the English Minister at Washington, wear thick-soled shoes, plain unpinned-back dresses and heavy old-fashioned cloaks. And they are pictures of health.

BRIGHAM YOUNG has sent word to the faithful at Ogden to stop baptizing into the Order of Enoch, saying that he would never have organized it if he had known how much opposition it would have excited.

JEFFERSON DAVIS now spends his time in looking after the interests of the Mississippi Valley Company, formed to develop inter-communication between the Southern States and Europe, and in watching Blaine.

THE Hartford City Government has named a park in that city "Bushnell Park," in honor of the Rev. Dr. Bushnell, who, 30 years ago, conceived the project of making the park out of what was then one of the most unsightly spots in the city.

DR. HAYFORD of Laramie, who drew up the Woman Suffrage law for the Wyoming Legislature says there are not twenty-five people in the Territory who would now vote for its repeal. Fights at the polls, street brawls and bar-room rows never occur.

Prof. Butestrierl of Naples, has invented a new method of illumination for lighthouses, which is an apparatus composed of several disks of polished silver or copper, so arranged that all the rays falling upon the disks are concentrated into one powerful beam.

SENATOR Sharon of Nevada was banqueted at the Palace Hotel in San Francisco on the 8th inst. More than half of the guests were millionaires, and the remainder were in no immediate danger of poverty. The bills of fare were engraved on solid silver dug from the Comstock lode, and were retained by the guests as souvenirs of the occasion.

Sewing Machines.

"GENERAL FAVORITE"

No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

NEWS CONDENSER.

— Several wagon trains of miners are on the way to the Black Hills.

— Religious services are held every Sunday in public school No. 8, Rochester, N. Y.

— A distiller in New Hampshire makes all his employes sign the temperance pledge.

— The Vermont fish commissioners have 50,000 land-locked salmon ready for distribution.

— The Light Guard of Green Bay, Wis., are going to walk all the way to the Centennial, 1,033 miles.

— June 17 was appointed for the National Democratic Convention, and St. Louis was fixed as the place.

— On some of the country roads surrounding Quebec, Canada, the snow is from fifteen to twenty feet deep.

— The striking molders of Albany, N. Y., are still on their muscle, and occasionally attack non-union men.

— A new Presbyterian Church has been organized at West Albany, N. Y., and a building 100x50 is to be erected.

— In England 39 per cent. of the population are married, in Ireland 30 per cent., and in Germany only 19 per cent.

— The Republican State Committee has decided that the State Convention shall be held at Syracuse on March 22.

— The submarine cable between Sydney and New Zealand has been successfully laid and opened for traffic.

— It is said that there is a prosperous colony of Americans, numbering 600 souls, in the province of San Paulo, Brazil.

— Council Bluffs is very lively just now on account of the hourly arrival of mining parties *en route* to the Black Hills.

— Business is steadily increasing on the New York and Canada railroad, and extra freight trains are run frequently.

— Car loads of salmon are every day shipped East from California. The California salmon is coarser than that of Maine.

— The experiment of raising Angora goats in the mountainous regions of Arizona has already proved a substantial success.

— Builders are putting up V-shaped contrivances intended to divide and turn aside the descending snow on Virginia City houses.

— The scarlet fever is raging at Fond du Lac, Wis., and instances where two or three children die in a family are becoming common.

— The new excitement in California about the Lick benefaction is caused by the employment of Chinamen in building the observatory.

— The high price of meat in England has brought to light the fact that there is at present less live stock in that country than in any other in Europe.

— Fort Wayne, Ind., has under consideration a proposition to purchase the Wabash and Erie Canal as a means of securing an adequate water supply.

— The Legal adviser of the "Law and Order" Society of Buffalo, N. Y., has sworn out warrants against about a dozen liquor sellers for violating the Sunday law.

— An old lead mine in Madison, N. H., has been reprospected, and what is claimed to be a vein of silver and lead was found in a new shaft not twenty feet down.

— A sleeping car was wrecked and burned near Wallingford Station, Vt., Feb. 23d, and Mr. Bissel, proprietor of the Sherman House, Chicago, and his son were burned to death.

— A child one and a-half years old died in Vergennes recently which weighed at its birth eight pounds, and never weighed more than that. For the last year it weighed only six pounds.

— The sound portions of the old Elm of Boston Common will be made into furniture for the City Hall of Boston, and specimens will be sent to the various historical societies of the country.

— The State of Sinaloa, Mexico, has three large cotton mills. None of the goods are exported, the home demand being fully equal to the supply. The State of California has not a cotton mill.

— A large manufacturing corporation has been started in Cohoes, N. Y., under the title of "The Ten Eyck Ax Manufacturing Company," for the manufacture of axes and edge tools of all kinds.

— A commission has been appointed by the Mexican Government to make inquiry into the condition of affairs in Lower California, and confer about the same with the American authorities.

— The Cornell navy has decided to send a freshman crew to the Saratoga regatta. The freshmen will raise $500, and the navy the remaining $1,500 necessary. Freshmen crews now row daily in the gymnasium.

— There are 203,000,000 British subjects exclusive of those in the British Isles. About 5,000,000 are in America, nearly 2,500,000 in Australia, 2,000,000 in Africa, about 176,000 in Europe, and nearly 193,000,000 in Asia.

— The Plymouth Church Advisory Council was dissolved Feb. 24, after sustaining Plymouth Church in its discipline and providing for the appointment of a scandal bureau to investigate charges against Mr. Beecher.

— The Liverpool Town Council have been requested to lend for the Centennial Exhibition the two pictures "Julian the Apostate Presiding at the Conference of Sectarians" and the "Fall of Rienzi the Last Roman Tribune," both of which are in the corporation gallery of that city.

Wit and Humor.

CONSTRAINT.

Down through the orchard wandered we
Where, bending low, each burdened tree
Hung full of fruitings yellow,
'Twas morning, and the autumn sun
Shone on the leaves of gold and dun
With radiance soft and mellow.

There came a blush upon her cheek,
I thought my time had come to speak,
She seemed so sad and tender;
I touched her snowy, dimpled hand,
But found no words at my command,
My burning love to render.

At last we paused beneath a tree,
The branch that sheltered her and me
Reached low its luscious fruit.
"Be seated, pray," I gently plead;
"I cannot—cannot," soft she said,
"I'm in my walking suit." [*Scribner's.*

SPARKS AND SPLINTERS.

MINOR events—births.

A MISS trial—courtship.

THE first thing in a boot is the last.

COMETH up as a flour—rising yeast.

MISS apprehension—arresting a female pickpocket.

A SCHOOL-BOY who does not know what a coat sleeve is for, nose very little.

"THE rich," said a Dutchman, "eat vension because it ish deer. I eat mutton because it ish sheep."

"THIS is spanking fine vinegar," said John Henry. "Ought to be spanking," replied young hopeful, "there's 'mother' in it."

COOK (come after a situation)—"By-the-by ma'am is there a rink in your neighborhood? for I shouldn't like to give up my skating!"

ATLANTA charges $700 for permission for a circus to exhibit one day, and the way circuses "pass on" makes tears stand in children's eyes.

A SCHOOLMASTER asked one of his fair pupils "Can you decline a kiss?" Dropping a perplexed courtesy, she readily replied, "Yes, sir, but, but I don't like to."

A CHICAGO poetess writes for a local journal the following poetical conundrum:

O monster man, handsome but untrue,
What shall a loving, lonely maiden do?

"DON'T come to see me any more just yet John; father has been having his boots half-soled, with two rows of nails around the toes," wrote a guiless Mosholu girl to her lover.

"LOOK at this republic one hundred years ago; and where are we now?" The nation moved toward the zenith of prosperity, but the speaker sat down on the wet ice in front of the post office.

"WHAT are you—confidence operators?" said a gruff old fellow to two little beggar girls, who asked for alms. "No, sir," said the smallest, with charming simplicty, "no, sir; but we opes to be."

"EPHRAIM," said Simon, "what does a young fellow look like when gallanting his sweetheart through a shower?" "Why," replied Ephraim, "he has very much the appearance af a rainbeau."

A SPRINGFIELD (Mass.) girl has been fooled by a Bavarian nobleman whom she expected to marry. She hasn't made up her mind whether to go to lecturing, writing novels, or go back to sewing shoe bindings.

AN Iowa woman claims to have made 1,095 fires during 1875. This is three a day, and it looks doubtful. After the fire is built and the wood brought into the house, almost any man is willing to sit around the stove and keep it going.

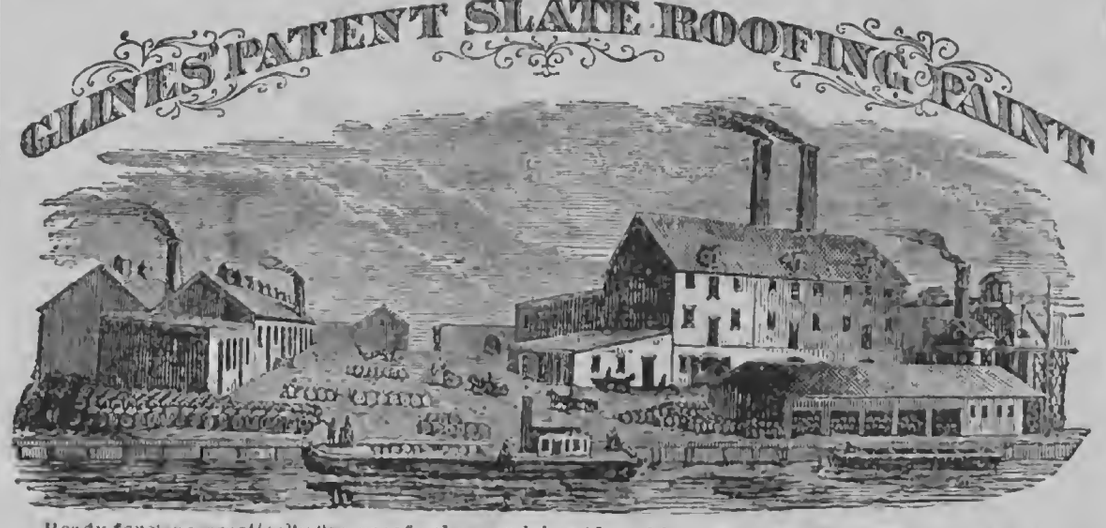
A CITIZEN of Leavenworth going to his barn to milk in the dark of the early morning, got into the wrong pen and undertook to milk a mule. He don't remember which side of the barn he went out at, but expects his bucket down in a few days.

CATS, foxes and weasels have always enjoyed the reputation of being remarkably sly, and they no doubt deserve it; but nothing can surpass the slyness with which a woman, surprised by an unexpected caller, will slip a set of false teeth into her mouth.

EDWIN (as the servant is present); Ah—j'ettay, see—ah—dissappointintay deme pas voo vwore a la riuk ce mattang; poor qwaw esker? Angelina. Ah, wee mais momong. Parlor Maid: Hem! beg your pardon, miss but I understand the langvidge.

"WHAT beats a good cup of coffee?" said Mrs. Spilkins to her husband the other morning at the brekfast table. He gave it up. "Two cups of coffee," said she. "What beats a good wife?" queried Spilkins. She gave it up. "Two good wives," said Spilkins, and then she got mad and sulked, nobody knows why.

A MEW-SICKAL SARAH-NADE,
With a Somewhat Affecting Involuntary on the Catarrh!



Ready for use; *practically* fire-proof; *cheap* and durable. *Live agent* wanted *in every town*, and liberal inducements offered. "How to *save* re-shingling—*stop* leaks effectually and cheaply in roofs of all kinds," a **100 Page Book *Free*** to any one *stating* where they saw this Notice. Write *to-day!*

OLD ROOFS.

Protect your Buildings by using Glines' Slate Roofing Paint, which neither *cracks* in winter nor *runs* in summer. *Old* shingle roofs can be painted looking *much* better, *and lasting longer* than *new* shingles without the paint, for *one-fourth* the cost of re-shingling. *On decayed shingles* it fills up the holes and pores, and gives a new *substantial* roof that lasts for years. *Curled* or *warped* shingles it brings to their places *and keeps them there.*

This slate paint requires no heating or thinning, is applied with a brush, and very ornamental. *One* coat is nearly equal to a *new* layer of shingles. Be sure you obtain our *genuine* article, which is *chocolate* color when *first* applied, changes to a uniform slate color, and is to all intents and purposes *slate.* On

TIN OR IRON ROOFS

the *red* color is often preferred, and is acknowledged the *best* paint in the market for durability, on metal surfaces. It has a heavy body, but is easily applied; expands by heat, contracts by cold, is a slow dryer, and never *cracks* nor *scales.* One coat is equal to 4 of any other paint. Buildings covered with tar-felt can be made water-tight, at a *small* expense, and preserved for years.

NEW ROOFS, 4½c. a sq. ft.

Mills, foundries, factories and dwellings a *specialty.* Materials *complete* for a *new* steep or flat Roof of Glines' *Rubber* Roofing cost but about *half* the price of re-shingling. For Private houses, barns and buildings of *all* descriptions it is far superior to *any* other roofing in the world for convenience in laying, and combines the *ornamental* appearance, *durability,* and *fire*-proof qualities of *tin,* at *one-third the cost.*

NO TAR OR GRAVEL USED.

We mail such *simple* directions for applying *any* one *can roof his own house.*

Rubber Roofing being very elastic, is *strongly* recommended by Architects, Corporations, Public Institutions, Builders, and leading men in all sections; can be laid *over* old shingles, felt, plastic and mastic roofs with *positive* satisfaction; will not draw in hot weather; sheds water readily, and is a strictly reliable article.

$3 000 easily made by Local agents. *You are wanted.* Profits *large.* Territory *free.* Write for "Terms" *now,* while you *think* of it.

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,

MAKING OF MAPLE SUGAR.

THE illustration which occupies this page gives a vivid description of the modes and manners accompanying the making of maple sugar in large quantities, which are now rarely seen in many portions of the country. Even in the new territories where maple trees are pleutiful sugar making is not nearly so general as it was in pioneer communities fifty years ago. Then large and thriving settlements depended upon home manufactures for the usual supply of sweets, and, with few of the modern conveniences, life in the sugar bush was far more disagreeable than now. No doubt the proportion of maple sugar is not so large as formerly; but it is still an important industry in many thrifty communities, and we believe can be made profitable wherever groves of maple trees are found. There is a peculiar flavor to maple sweet which is decidedly superior to that of any other—at least in our opinion. It is very probable that as maple orchards become scarce the price of maple sirup and sugar will rise high enough to make the land worth more covered with maple trees than it would be with anything else. In fact, hundreds of acres of rough land might be profitably planted to maples with the certainty that the next generation would find them highly profitable.

Our illustration, telling the story of sugar making in its various processes, is so perfect a reproduction of similar scenes often witnessed

SEASONABLE SCENES IN THE SUGAR ORCHARD.

in the sugar bush that it needs no further descriptive comment.

TIMELY HINTS FOR SUGAR MAKING.

A WRITER in the New England Farmer makes some timely and practical suggestions on the manufacture of maple sugar. Believing that wherever maple trees abound it will pay farmers to make their own sweets, we copy:

Wait till the season fairly begins. If you tap too early, the wood is dried by freezing, and the sap will not run as well afterwards. On account of their location, some sugar orchards will run earlier than others. If you tap later, the aggregate product of sugar may not be diminished. But get all things ready, and when the right time comes—go! Tap with a one-half or three-fourths inch bit and bore one and a-half inches some say less, where the wood is sound, and on the side where the sun will reach it the most of the day. Gather the sap every day it runs, so that at night there may be but little or none left in the buckets. Strain the sap and boil rapidly and make into sugar as soon as possible. Keep the sap clean while boiling, and strain the sirup through a woolen strainer, or let it stand a few hours and settle. Use no eggs or milk in cleansing. When the syrup will grain by stirring, remove from the fire and stir till it cools. If the sugar is too soft, it will not keep as well, and will drain considerably.

In conclusion, I will only say, all the utensils used must be thoroughly clean and free from the taints of previous years. The sap must be promptly gathered and converted into sugar, if a superior article is expected or desired. Maple sugar is often dark-colored and waxy, this is owing to the use of old, tainted, wooden buckets and delay in its manufacture. Sap changes rapidly, and requires rapid conversion into sugar, or its delicate color and flavor will be lost. Other causes sometimes affect the quality of sugar. Some soils are not favorable. The ravages of worms the previous year, the presence of rain water and snow in the sap, all these detract from the qualities desired.

Farm Economy.

ABOUT UNDERDRAINING.

CAN you or some of your numerous readers inform me through the RURAL, how to construct an underdrain? I am at a loss how to do it. I have French on farm draining, but see nothing to answer my purpose. The water descends from across the road on to my land. It will require about 2 five-inch tile to carry the water; the difficulty with me is how to let the water into the drain and keep the sediment out, there not being much fall. I have open ditches, but every year they require cleaning out. Also if it could not be constructed of timber and how, as large tile would have to be shipped here. What underdraining I have done has paid me well. One constructed nine years ago paid expenses in two years.—A. W. H.

If our correspondent had not had some experience in underdraining we should guess that he was certainly mistaken in the amount of water to be carried off. The two five-inch tile we suppose are only needed during very wet weather in spring and fall; but even then this is probably a larger drain than will be needed, as it would give fifty square inches of water—enough, if running in an open channel, to seem like a young river. One five-inch tile will carry off nearly twice as much water as a four-inch and three times as much as a three-inch. In a large tile there is less friction against the sides of the tile. We have often seen a three-inch tile spouting out water apparently much larger volume than could be got in a pipe 4 x 4 inch or even 5 x 5 inch. With such a volume of water a very light fall, if continuous, will remove all sediment from the bottom of the pipe. Be very careful in laying the tile, using a 12-foot board, straight edged on both sides, with level fitted into it. This will at once show any inequality in the bottom of the ditch. If one tile, or one end of a tile, sinks down half its hight, the sediment will lodge at that depth and the effectiveness of the ditch be thus impaired. If the ground is soft, with occasional pockets of quicksand, it will pay to lay the tile on a board, and where very level the boards planed a little at the end and overlapping each other. A three or four-inch tile laid thus will often carry off more water than a much larger drain as commonly laid.

We do not advise board drains. A board laid under tile, filled with running water and always wet, will last much longer than boards used for drains and alternately wet and dry. Possibly our friend may find that one four-inch pipe will convey all the water that now runs through his large open ditch. We have known such cases. To prevent the sediment running in at the end a wire gate may be placed over the mouth, and the opening to the surface of the ground be filled with small stones and gravel. It will do no great harm if in very severe freshets the water ponds back above the top of the drain for several days or one or two weeks. If he is careful not to leave the ground naked during the winter it will do no hurt to have some of the surplus water run over the surface in a small furrow made a little one side of the underdrain so as not to break through. We should advise this, unless there are special reasons otherwise rather than go to the great expense of having a drain made of two five-inch pipe. It is rare that so large an underdrain is advisable on ordinary farming land, though it may be in gardening or where back water floods houses and cellars. We are glad to know that our correspondent finds underdraining profitable, and don't want to have him discouraged by undertaking too expensive a job.

If the line of his proposed drain is dry during any part of the season he can save a great deal of digging by plowing out deep furrows and using some of the various subsoilers to loosen the dirt before it is thrown out. One of the best implements of this kind is simply a sharp point attached to a beam, like an ordinary plow, and with two horses and wide evener, so as to allow them to straddle the ditch, one man and team will do the labor of ten men or more with spade and pickax. We have reduced the cost of digging the ditch fully one-half where we had long, straight lines of ditch to dig. The ditch can be filled by team and plow, and the land leveled off in much the same manner. Ditching is, at best, an expensive undertaking; but on all soils that need it, nothing pays better. It is, therefore, doing the farming public a service to publish any means by which underdraining may be more economically accomplished.

LIVING TREES FOR FENCE.

I DESIRE to call the attention of farmers to a kind of road fencing which I think will prove substantial and not very expensive. This plan requires, first That the roads shall be planted on either side with lines of trees, twenty feet apart in the row. When the trees have attained the size of five or six inches in diameter at the base, they may be used as supports for wire fences. Sugar maple, elm, oak, black walnut and hardy evergreens are adapted to this purpose. The common cedar transplanted from the swamp, grows vigorously on high ground. The plan for building this fence is by fastening oak scantling two inches square by four in length to the trees with coach bolts. Two and one-half inch bolts five inches long go loosely through the timber and screw firmly two inches into the tree, leaving an inch space between the tree and the timber. The bolts can be turned out as the growth of the tree requires. The holes in the trees should be seared with a hot iron and swabbed with wax.

Six strands of No. 6 wire are used which pass in holes eight inches apart and of sufficient size, to allow the wires to run freely through the timber. In like manner the wires go through 1½ inch square oak pickets placed four feet apart between the trees. The top and bottom wires are wedged in the pickets to keep them in place. In sections of twenty-five rods, posts are set and firmly braced, to which the ends of the wires fasten. Each wire is provided with a stretcher by which the tension is regulated. The stretchers are made of ⅝ inch round iron, one foot long with eye at one end to hold the wire and thread cut six inches on the other which goes through the post with handle nut. The tension of the wires should be slackened during winter to allow for contraction by frost. The size of wire, number of strands, and closeness of pickets, should be graded to meet the demands of the fence. One of the advantages of this kind of fence is exemption from snowdrifts, while the trees are a thing of beauty and constantly increasing value.

A fence on our place very nearly answering to this description supported on maple trees of 12 or 14 years planting has answered so good a purpose the past season that we can recommend it for trial to others. Farmers plant your trees. Mark this Centennial year by millions of trees planted along the public highways. An average of 10 days judiciously employed by each farmer in the country, in planting highway trees cannot fail to prove a satisfactory investment of time. Plant with care and mulch thoroughly, these are important conditions of success.—J. O.

WIRE fences have not generally proven successful in fields constantly pastured. The plan above sketched seems to be well adapted to roadside fences and is well worthy of the consideration of farmers.

SEEDING CLOVER FOR FALL PLOWING.

A SUBSCRIBER to the RURAL NEW-YORKER asks us whether we would advise sowing clover seed on a piece of wheat which he intends to plow up and re-sow in the fall. The soil is rich and the wheat has a good growth and promises a large yield. The field was a clover ley and a fine growth of clover was plowed under last summer. Our friend's idea is that by sowing clover seed early sufficient growth might be obtained to pay for the seed. In this we think he is mistaken. Clover the first year does not amount to much, and the roots, which are the most important portion, are very small. If plowed for wheat it should be turned under as soon as the grain is harvested, and this would leave less time for it to grow. Besides, if the wheat proves a good crop it will keep the clover down until harvest. In all probability much of the clover seed sown will be smothered by the luxuriant wheat crop, and you will have a better chance for getting a good catch of clover to wait till next year before seeding. Clover seed is likely to be dear this spring, and it is hardly worth while to sow it except where there is a good chance for a catch. For some reason wheat after a fallow crop—wheat, oats, barley corn or potatoes—secures a better seeding of clover than wheat after a clover ley. Hence on rich soil we should not hesitate, if other circumstances made it advisable, to sow two crops of wheat in succession. Reserve the cost of the clover seed now and use it in the fall to drill in some superphosphate with the grain and it will give much better results than what little clover you could have to turn under after harvest. It will probably cost now two dollars or more to seed an acre with clover seed, and this would apply nearly 100 cwt. of superphosphate to the grain, drilling it in evenly with the seed. The chances are that this would give a greater weight of concentrated fertilizer than the entire amount of clover that could be scraped from the soil in August, including roots, stems and leaves.

There is nothing magical about clover as manure. Its chief value is in loosening and aerating the subsoil, and this it hardly begins to do until the second year of its growth, and only accomplishes perfectly when it is allowed to grow without disturbance till it has blossomed twice—once for hay in June and again for seed in September. The small amount which will grow in one season is hardly worth considering while clover seed is as dear as it is this year.

Field Crops.

VEGETABLES CULTIVATED BY INDIANS.

THE question as to what vegetables were cultivated by the original inhabitants of this country can hardly fail to be of interest to their successors—the American farmers of to day. Probably the agriculture of the Indians was of a very primitive character, but maize (Indian corn,) pumpkin, squash, and tobacco and beans, seem well established. The mixture of green corn and beans in the Indian dish, called succotash, will probably always retain its primitive name and be a memorial of the aborigines long after they have passed away. In the Bulletin of the Torrey Botanical Club we find a letter from Dr. J. HAMMOND TRUMBULL of Hartford, Conn., giving some very interesting facts about the aboriginal agriculture which may be new to many readers. We copy as follows:

I could never discover where the doubt came in, as to the American origin of several well-known varieties of (to quote old Parkinson) "these Gourds, or Millions as some call them, or Pompions as I may call them."

First, for the northern varieties of "Squash." In the last edition of Webster's Dictionary, I gave briefly the origin and meaning of the name, and more fully in a note to my edition of Roger Wilham's "Key," p. 125. It is unquestionably of Algonkin origin. The root, *asq*, denotes something immature or not complete: hence, it takes the two-fold meaning, raw (i. e. not cooked) and green (not ripe). It became the generic name of fruits and vegetables which might be eaten green or raw, and particularly of Cucurbits. The Indian plural of *asq*, in the Massachusetts dialect, is *asquash*.

Wood, in "New England's Prospect," published in 1634, says, that "in summer when the corne is spent, *Isquouter squashes* is their best bread, a fruit like a young Pumpion."

Roger Williams (l. c.) wrote in 1643: "*Askutasquash*, their vine apples, which the English from them call 'Squashes,' about the bignesse of apples, of several colours, a sweet, light, wholesome, refreshing.

Eliot, in translating the Bible, puts *askootasq*, plural *askootasquash*, for "cucumbers," in Numbers xi., 5; *quonoosq* (literally, long-asq) for "gourd;" *monaskootasquash*, for "melons," etc.

Josselyn (N. E. Rarities, 57) says: "*Squashes* but more truly *squonkersquashes*, a kind of melon, or rather gourd; for they often degenerate into gourds. . . . . The yellow squash, called an apple squash (because like an apple) and about the bigness of a pome-water, is the best kind."

In England, the name 'squash' was understood to be of American origin. Robert Boyle mentions his experiment with the seed of "squash, which is an Indian kind of pompion that grows apace." (Works, i. 494.) But the name is not found, for any Cucurbit (or for any other fruit), in the earlier English herbalists—before 1650. It is used by Shakespeare for an immature pea-pod—perhaps so called because of its emptiness, (i. e. easy to be crushed, or, as we sometimes hear in the vulgar dialect of New England, to be *squashed*.

Going South we find, still earlier, two Virginia Cucurbits, with Indian names adopted by the English, and still in use: the *Macock* and the *Cushaw* (corrupted to "Kershaw.") Clusius (Exotic l. ii., c. 2) describes the "*Macocquer Virginiensium forte*," from the specimen sent him from London in 1591, which James Garet brought from "*Wingandecoor* Provincia, quam Angli *Virginiam* nuncuparunt." This specimen was hard shelled, orbiculate, about four inches diameter, the seeds flat and heart shaped. In the edition of 1605, he mentions the receipt of another specimen, which young John de Laet bought of a sailor at Amsterdam. Of the former he says, "As it is reported to have come from Virginia, I readily persuade myself that it is the same which the natives of that country call *Macocqueer*," etc.

Strachey, in his "Historie of Travaile into Virginia," 1610-12, describes this species: "The *macokos* is of the form of our pumpeons—I must confesse, nothing so good—'tis of a more waterish tast." "The inhabitants," he adds, "seethe a kind of *million*, which they put into their walnut-milke, and so make a kynd of toothsome meat." [This was, evidently, the rudimentary pumpkin pie.] In the Indian vocabulary appended to Strachey's book, he gives: "*mahcuq*, a pumpeon."

Beverley (Hist. of Virginia, 124) describes the *Macocks* as "a sort of a Melopeponc, or lesser sort of Pompion or Cashaw . . . . *Squash*, or *Squonker-Squash*, is their name among the northern (i. e. New England) Indians." . . . These are summer squashes, "never eaten after they are ripe."

"The Virginian Macock or Pompion, *Macocks* Virginiani, sive Pepo Virginianus, is described in Johnson's Gerarde (1636) p. 919; and on p. 920, he figures "The small round Indian Pompion" and "The cornered Indian Pompion." The latter, from the figure, may be our common scallop squash. On page 921 he describes the Virginian Water-melon, "melones aquatici cujusdam" from a specimen brought Oct. 10, 1621, by John Goodyer. The other species, he says, "are common in England," but the last described (the Water-melon) "is as yet a stranger."

The Virginian Cushaw (now "sometimes spelt Kershaw," according to Bartlett, who notes it as a "Western" name) was, I think, our old-fashioned winter Crook-neck. In Hariot's Virginia, the name is given as *Ecushaw*, which is probably the Virginian equivalent of the northern *asqua* and *asquash*, and of the modern Chippeway name of a squash or pumpkin; *agrissimun*. "These *Cushaws*," says Beverly (p. 124) "are a kind of Pumpion, of a bluish green color, streaked with white when they are fit for use. They are larger than the Pompions, and have a long, narrow neck." "The *Cushaws* and Pompions they lay by, which will keep several months good, after they are gathered." (p. 152.)

None of the North America species is described or named by Dodoens or his translator, Lyte, in 1578, nor in the excellent old Herbal of Jerome Bock (Hieron. Tragus), but the latter, in the edition of 1552 (pp. 831-836) describing the "Cucumis seu *Zucco* marinus," under *Indianisch* Oepffel," mentions it as one of the many species of foreign plants introduced, within the past few years, to Germany from distant countries. He distinguishes four sorts of "*Mala Indica*, Indianisch Oepffel" Crocea, Lutea, Citrina, and Nigra. "The *Zucco morosa*, as they are commonly called, because they first came ex *ultramarinus regionibus*, some from Syria and some from India, as their popular names testify, *Zucco de Syria* and *Zucco de Peru*," etc.

But I will not meddle with the Peruvian or the Mexican species. As regards North American varieties, the evidence seems conclusive. Three varieties at least still bear Indian names, which date from the first coming of Europeans, and of these varieties we have no mention before they were found in North America.

TOBACCO FARMING A FAILURE.

THE losses of farmers in the Connecticut Valley within the past few years from low prices of tobacco and partial failure of crops, have put this branch of farming under a cloud. Mr. H. C. HASKELL, in a recent essay published in the N. E. Homestead draws this graphic picture of the effect on the farmers of Connecticut.

A few years ago, tobacco was bringing twenty-five or thirty cents, and sometimes more, then every body went into the raising of that article. Every old building was filled, new Barns went up on every hand. The weed was raised upon all kinds of soils and in all situations.

What has been the result? The prestige of the Connecticut Valley seed leaf has been almost ruined. You have raised crops of every color, fitness and quality; perchance upon the same farm, and when stripped they were all packed together, thus ruining the reputation of the grower, when it might have been different, if each lot had been seperate.

What is the prospect for tobacco in the future? I must say it looks dark: the present crop is now selling at about the cost of production, in many cases less; the crops of 1873 and 1874 are selling at far less than the cost of production. What does it cost to raise an acre of tobacco? I cannot figure it less than about $140, and I doubt if the crop of the valley, averages 1400 lbs. per acre, so that I think it a positive loss to raise it, for less than ten cents per pound. At those figures per acre, a larger production can be raised for less, while a smaller costs more. Many farmers say that they cannot raise it, at even twelve cents per lb.

My advice would be, if you have land suitable and buildings fitted for the crop, to continue to raise what you can manure and tend, and do it and no more. It is a long road that never curves. It has turned once, and it will again, it may never pay as well as in the past, but still be a paying crop.

The Swine-Herd.

CAUSE AND CURE OF HOG CHOLERA.

Probably the direct losses of American farmers have been greater in hogs the past two or three years than in any other kind of stock or in any farm crop. A correspondent of the Cincinnati Gazette discourses on the origin of hog diseases generally, and gives a remedy which he has found effective:

Among some of the causes which produce cholera may be mentioned extreme and sudden changes: long hot and dry weather, as in the year 1871: long dry and cold, as in the winter of 1874 and 1875, followed by the unprecedented rains which fell during the summer of 1875. These rains caused an extremely rapid growth of grass making it "washy," itcontrilions, and defective in the qualities calculated to excite the secretions; and producing billiary derangements and congestion in an already over-taxed liver that had suffered from an unparalleled long, cold winter, forcing the blood from the surface, unequalizing the circulation and centering an undue amount to the internal viscera of the hog.

Another cause is found in hogs occupying one field or pen from year to year, without cleansing or plowing under the accumulated filth, having the hog constantly "rung," denying him a taste or smell of fresh earth, or the use of an instinct that teaches him in bilious derangements to search for bugs, worms, or vegetable roots, the natural excitants of stomach, liver and bowels. Another cause is scanty feeding, muddy, stagnant, and filthy water, obliging them to allay their thirst often from the draining of their own discharges.

When the disease first made its appearance a few years ago, it was characterized by many symptoms resembling cholera in the human being, even watery discharges, emaciation, and rapid waste. Its most usual form now is loss of vitality, emaciation, and drying up, with occasional paralyzes or an entire suspension of secretions; no discharges; with an inflammatory state of the liver, sympathetically affecting head, throat, and lungs.

The health of the hog is much dependent on a healthy state of the liver, as that organ mainly governs the secretory system. But, at the same time, it does not render it proof against the introduction of poisons; for cholera may be contracted through the lungs or stomach. While some lots have suffered much from a combination of the causes which we have enumerated, rendering them highly susceptible to infection, others that have been treated in accordance to the instincts of their natures are almost proof against diseases.

One of my neighbors had two fine lots in separate fields some distance apart, composed of older and younger hogs. Out of the older lot he had already lost eighteen head in two months. On one occasion I went with the hand employed to feed the younger lot, and, on seeing a pig among the more thrifty ones poor and sickly, I asked the young man why he did not remove it, for I thought it had the cholera. He said that it had been sick about three weeks, and that he had spoken to the owner about it. But the owner had answered him by saying "let it alone; what will die, will die, at any rate." His hogs did contract the disease from that one, and he lost many, when five-minutes' time would have saved him grief and money.

PREVENTIVE AND REMEDY.

One pound madder, 1 lb. sulphur, 1 lb. resin, 1 lb. saltpeter, 1 lb. black antimony, 3 ozs. assafetida. Pulverize and mix well; feed 3 tablespoonfuls to five hogs three times per week in a little salt, more bran and ashes. Commence feeding before the cholera gets into your neighborhood, and continue until it ceases from the same; and if, during the time and before your hogs are properly medicated, one should take the disease, immediately remove it to a dry pen. Give 1 tablespoonful of this mixture in 1 gallon of water or table slops once per day; and in order to make the cure doubly sure, take ½ pint soft soap, 1 tablespoonful pine tar, 1 do. of lard; warm and mix well, and drench the hog; and my word for it, it will cure ninety-nine out of the hundred.

If you will treat the first one or two in this manner, the disease will spread no further. And you must remember that as fast as the disease spreads, or in a ratio to the number infected, its malignancy increases, until it will almost defy control. If the season should be wet, keep your hogs on short timothy pasture; if dry, on the best growth clover you have, and these are valuable helps. Sweet milk alone is said also to be good.

BERKSHIRE SWINE.

S. A. Knapp, an Iowa swine breeder, thus states his very high opinion of the Berkshires:

"The Berkshire hogs are superior to all others for the following reasons:

"1st. They possess greater vitality, and hence are less liable to disease.

"2d. They are more prolific. Mature sows seldom raise less than eight or nine pigs.

"3. Being strictly a thoroughbred hog, the pigs are uniform—all choice.

"4th. Their flesh is firmer than that of any other hog. They furnish superior ham, shoulder and bacon. They bring a higher price for the English market."

Soap for Hogs.—The exemption of hogs fed from the slops of hotels and private families from attacks of cholera is attributed to the fact that such slops contain a considerable amount of soapy water. The effect of potash is to cleanse the hog's intestines of worms, making them more vigorous and healthy, and a little soap fed with corn is therefore recommended both for economy and as a safeguard against disease.

Dairy Husbandry.

TIMELY ADVICE TO DAIRYMEN.

Mr. Robert McAdam, a distinguished Cheddar dairyman who learned this process of cheese making from Mr. Harding of Markbury (Eng.) and who has for several years been the manager of a factory near Lee Center, Oneida Co., made some valuable remarks at the late Convention at Rome, which deserve a more extended report than has been given them. Mr. McAdam practiced cheese making in Scotland 15 years, and then went into Somersetshire to learn the Cheddar method. He practiced this method for a number of years in Cheshire, and coming to this country several years ago, has been following the business in this country, being the owner and manager of the factory near Lee Center referred to. His views are therefore entitled to careful consideration, since from his experience and observation as a cheese buyer and manufacturer both in Great Britain and in this country he is abundantly competent to judge of the faults of our dairy system.

He very aptly points to the characteristic traits of Americans in running after new theories—many of them without foundation—in the hope of remedying the faults in our cheese, while the plain common sense requisites are constantly overlooked. Thus he says, in referring to the difference between our factory cheese and the fine cheese of England, which sells there for 30@40s. sterling more than ours, as follows:

HOW ENGLISH AND AMERICAN MILK DIFFERS.

The fine cheese of England are made from milk which has been produced from healthy cows fed on good herbage, the milk having been properly cared for in every respect with the most scrupulous cleanliness. But here in America, under the factory system, care and cleanliness about milk is often a lost art—or rather, an art that has never been acquired by many cheese factory patrons.

Many will say, The cheese maker ought to see to all these conditions; but the thing is impossible. Can he inspect every night and morning the milking pails, milk cans and milkers' hands; or can he see that no green or gargeted milk is sent to the factory, or see whether the cows were hurried home with a dog, blown and sweltering with heat, or can he see how many cows were left unmilked over night and their half-putrid messes sent to the factory in the morning to operate like yrast on the well kept messes of careful patrons; or can the cheese maker prevent patrons from detaining their milk at home after milking is finished, or from lingering to gossip on the way and then racing to the factory with the hot milk closed up in the cans, advancing rapidly toward putrefaction?

Another very injurious practice is mixing the morning and evening messes of milk, thereby promoting very pernicious effects and depriving the maker, in a great measure, of his power to discover fraud. These are causes which the cheese maker cannot control, and it is these which baffle the skill and frustrate the efforts of the most competent manufacturers, and those are the greatest causes of inferior cheese. But besides, the cheese maker has a continued war to wage against slovenliness. He may even furnish the patrons with strainers and aerators to cool the milk, but cannot get them into use; for in the factory strainer are found leaves, seeds, hairs, feathers, scabs, clots of blood, cow manure, flies, bugs, beetles, spiders, worms, snails, and lizards, which speak volumes in regard to the care and cleanliness of cheese factory patrons. It surprises belief to narrate the ignorance and carelessness manifested by many patrons about this, their most valuable product; and it is evident many have only one concern about their milk, and that is—*that it should weigh well.*

Mr. McAdam makes rather a bad case against patrons; and although great carelessness and slovenliness often prevails, it is to be hoped the cases to which he refers are exceptions.

BREAKING AND HEATING THE CURDS.

On the above points Mr. McA. gives some useful hints. He says: "The act of cutting and breaking up the curd after coagulation, ought to be performed very gently and carefully, and the succeeding warming up still more so.

One great cause of cheese getting off flavor, arises from rapid and incautious heating up. By this a portion of the butter becomes liberated from the caseine and forms an oil which pervades the whole mass of curd, and as it (the oil) does not take salt to cure it, as the curd does, it quickly becomes rancid and induces putrefactive decay. Another source of evil is the cream which rises. This should either be carefully skimmed off and passed through the strainer with the warm milk or gently heated up to 98 deg. Fahr. and completely mixed again with milk before the rennet is added.

Another error is putting the curd into press at too high a temperature. This assists early curing, but also promotes early decay. And keeping the cheese at a high temperature whilst curing, also tends to impair their keeping qualities.

A WORD ON INCOMPETENT CHEESE MAKERS.

Of late the practice of employing raw and incompetent cheese makers at the factories has been gaining ground, the reason being that such hands can be employed more cheaply than experienced and competent persons. Mr. McA., in touching this point, says the want of keeping qualities of American cheese is now the greatest drawback in the English markets. But as the proper development of acid wipes out the old porousness of American cheese and gives the desired solidity, so the proper condition of the milk and the skillful handling of it may yet give the desired pure and permanent flavor. To a cheese buyer who weekly examines a great many factories, it is evident that there are many makers who are quite incompetent to manage a cheese factory. Indeed, many of them have no proper idea of what cleanliness is, and it is often disgusting to look upon the slovenliness and filth surrounding both milk and cheese. Swarms of flies enticed by the foulness, infest the cheese and numbers of them, dead and drowning, are floating in the cheese vats during the heating process. And it is no unusual thing to find the cheese maker equally untidy in his own person, with a black pipe in his mouth and a rake (*miserable tool*) in his hand, warming up a vat of curd, his mind evidently more engrossed with the going of his pipe than with care of the precious contents committed to his care. Such persons are no more fitted for the place they fill than for the office of Chief Justice of the United States; and cheese factory patrons neglect their own interest when they do not make certain that careful and competent persons are to manage their factories. Many fancy that a few months working in a factory is sufficient to acquire all the knowledge that is necessary. Such an idea is simply a delusion. It would be infinitely better for any beginner to work in a first-class factory for a season or two for nothing more than instructions rather than undertake the responsibility without a complete knowledge of it.

THE BEST FACTORIES AS SCHOOLS.

Mr. McAdam thinks the best factories ought to become schools of instruction, and he advises cheese makers to look for the causes of their troubles which he has indicated and throw *mere theories* to the wind. He evidently has not much faith in certain expounders of dairy lore, who are ever ready, when present at the Dairy Conventions, to take the stand and answer all questions from imaginary premises rather than from those found true in practice, and he cautions dairymen not to be diverted from seeking the real by imaginary evils.

UNSOUND THEORIES.

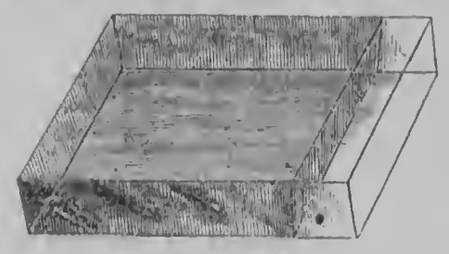
Referring to some of the foolish theories afloat and which have been promulgated by men assuming to be scientists, he says floating curds are absolutely unknown in Cheshire, and during 11 years' practice there as a cheese maker and 15 years' practice in American cheese factories, he is convinced that causes which operate to produce certain effects in England will produce like effects in America under similar circumstances. Science he thinks, up to this time, has done little or nothing to aid practical cheese making. We must look for help in the experience and practice of those who attain the best results, and if the worst class of cheese now made could be elevated to equal the best, the best would undoubtedly advance nearer the standard of fine English, and it is by still copying the Somersetshire or Cheddar modes of practice and keeping our milk perfectly good and pure that we can hope to attain that degree of excellence in our cheese which will entitle it to be classed among the luxuries of life.

These suggestions, which we have selected and condensed from his paper kindly furnished by him to us, are worthy the serious consideration of our dairymen who are about to commence another year's operations.

MANNER IN WHICH CREAM RISES.

The following result of experiments as detailed by our esteemed correspondent, will be of interest to butter makers. It is the first description we have seen in regard to the appearance of the cream in rising. The apparatus employed for observing this process is an original idea with Mr. F., and will be found valuable to others for conducting like investigations. We are glad our remarks in the "Butter Book" are calling out experiments:

Hon. X. A. Willard:—When I, not long since, reported to you the trials suggested to me by your remarks in the "Practical Butter Book" regarding the Swedish system of setting milk, I was so deeply impressed with the rapidity the cream raised when set in water at a temperature under 37 deg. Fahr. as compared with that set at 50 deg. Fahr. and over, that I began to question



GLASS MILK COOLER.

whether this rapid rising of cream was beneficial and to consider whether I could in a crude way discover how the fatty parts of milk act in their efforts to separate themselves from the component parts of milk in seeking their natural gravity.

Since my experience proves to me that rapid rising of cream shows to the eye a larger percentage at the termination of the rising process than a longer setting, evidences, the object of this investigation has been to ascertain the *manner* of this rising of cream from milk and, if possible, incite the assistance of those better qualified than myself to determine—First, Does the cream under the method of this rapid rising, by its subsequent contraction return to the milk any ingredient that would assist in improving the quality or weight of the cheese made from the milk devoid of cream? and Second, Does it by its contraction dispose of material such as caseine—that tends to injure butter? We all know that cream raised from fresh milk by any method, contracts to a greater or less extent, but under this Swedish system the contraction is in excess of all other methods I have investigated, while the rapidity of extracting the cream from the milk, is far beyond any plan I have practically used or experimented with a great desideratum when the object sought after is to secure all the cream for butter and insure a sweet milk for cheese.

The cooler used for the purpose of seeing how cream was driven to the top of milk when surrounded by ice water, was made of glass, consisting of two separate pieces: one vessel was 12x2x8, being the outside vessel, and to hold the water; the other, or inner vessel for the milk, was 10x1x8, and I give you drawing of outside case. By using a strong light, placed on opposite side to the eye, the action of the cream could, after it began to fully separate itself from the milk, be distinctly seen. I tried two specimens—one quart each—of milk from same cow. No. 2 was left 12 hours after milking before being put in the tester, but well stirred up in order to ascertain if cream once separated and then jolted over a road to a factory, would again rise to the surface as freely as fresh milk. Temperature of room in each case was 62 deg. Fahr., and water 35 to 37 deg. Fahr. No. 1 was set shortly after being drawn from cow and stood at 80 deg. In 2½ hours all the cream had risen, being 12-54ths in quantity. There was but one action noticeable in the milk, and that was the globules of cream rising upward without any counter action apparent to the eye assisted with the magnifying glass. At the end of six hours the cream had contracted to 11-54ths of the body of milk, and at the end of 12 hours to 9-54ths of the whole. No. 2 stood at 62 when put in the tester. At the end of 2½ hours the largest portion of cream had risen; still, small particles could be seen making their way to the top for five hours after setting, but all the while decreasing in size. The appearance of particles of cream in No. 2 was ragged and unlike No. 1 which, as I before stated, was globular in form. But there was no contraction in cream of No. 2 which, however, at no time showed over 6-54ths of cream.

This is the result of experiments as I have made, and while I am compelled against my heretofore educated notions to concede the palm to the Swedish system for rapidity of raising all the cream from milk, I would be pleased to have some one explain why it, the cream, contracts so rapidly and extensively—in other words, answer the two questions I advance. With your permission, I propose to test other points suggested in the "Practical Butter Book," and remain,

Sherburne, N. Y. HENRY O. FREEMAN.

If a new milch cow drops off in her mess of milk, no after feeding will entirely regain it.

Around the Republic.

"DOWN SOUTH."

Diary and Notes of an Ex-Editor Seeking Health.

BY CHARLES D. BRAGDON.

Jacksonville, Fla., Feb. 5.—Strawberries in market—Wilson's; only colored, not ripe; $1 per quart. Grown 40 to 100 miles up the river.

"Strawberries are never cheap here; they bring too much North, and there are not enough growers in proportion to the consumers." So said an old resident to me today.

In December I saw, a couple of miles down the river, strawberry vines in bloom. Since that time, however, there has been frost enough here to destroy that promise of a crop. Yes, they were growing in this white sand, which is the prevailing feature of this city and neighborhood; but there was a mixture of "muck" from the swamp in it.

One day I was riding around Jacksonville with a gentleman who has lived hereabouts thirty years. As we drove through the best built portion of the city, he said, "I can remember when all this was hammock."

"This, then, is hammock land?" I asked.

"Yes."

Be it known—it is generally known by any one who has lived in Florida a week—that the lands of Florida are divided into two grand divisions, known, superficially, as "Hammock" and "Pine" lands. When a man talks to us about "Pine" lands we understand him; but a raw Northerner, like myself, does not master the "Hammock" so readily. I left my "Unabridged" at the RURAL office and never carry a pocket dictionary; hence I had to expose my ignorance and ask, "What are 'Hammock' lands? What distinguishes them from "Pine' lands?"

"Why, they are the lands upon which hardwood timber grows—such as the Oaks, Ash, Maple, etc."

I have asked the same question many times since, and the result is that "Hammock" lands are those upon which there is a growth of deciduous timber, as well as the hard-wood Evergreens. Why they are called "Hammock" lands I have been unable to learn. There may be, of course, as many varieties of soil included in these "Hammock" lands as there are in our hard-wood lands North. They are esteemed more highly than the "Pine"—especially for Orange culture.

One gentleman from a Northern State, who had traveled through Florida considerably, listening to the above conversation, said, "There may be a difference in the productive power of 'Hammock' and 'Pine' soils, but I don't see why there should be—the whole State is a sandbank, any way."

The impression made upon most travelers who see superficially only is like that of the above gentleman. But here is my neighbor the Alderman, who has a farm, only three-fourths of a mile from this city, of deep, white sand, and who talks to me of a stiff clay soil with iron in it which he "plows up in lumps." I accept the clay, but not the iron.

One thing is never refused here by any man who owns land that he cultivates—that is, manure. "Can't get along without a right smart lot of manure on our lands," said the Alderman. "But guano is bad; them as has tried it didn't find it profitable." I should think not, indeed!

An item for owners of Northern sheep pastures: The Alderman owns the "villa" in which I reside. It adjoins his own residence and is a part of the homestead lot. The other morning he planted a couple of rows of fig trees between the house and the front fence. I noticed he planted one of them out of line to avoid disturbing a big Mullein, which is one of four growing in our front yard—precisely the same thing as those yellow-flowered sentinels of our Northern pastures. I said, "Alderman, what plants are those which you seem to cultivate with so much care?"

"Them, sir, are Mulleins—a very useful plant indeed, sir. We think a great deal of them, sir."

"What are they good for?"

"We use them for bathing, sir."

"Bathing?—how for bathing?"

"Why, sir, we takes the leaves and steeps them in hot water, and uses the steep to wash any sore, wound, bruise, or swelling. It is very soothin' and healin'. We wouldn't know how to do without it."

"But don't these plants grow wild here?—are they not common?"

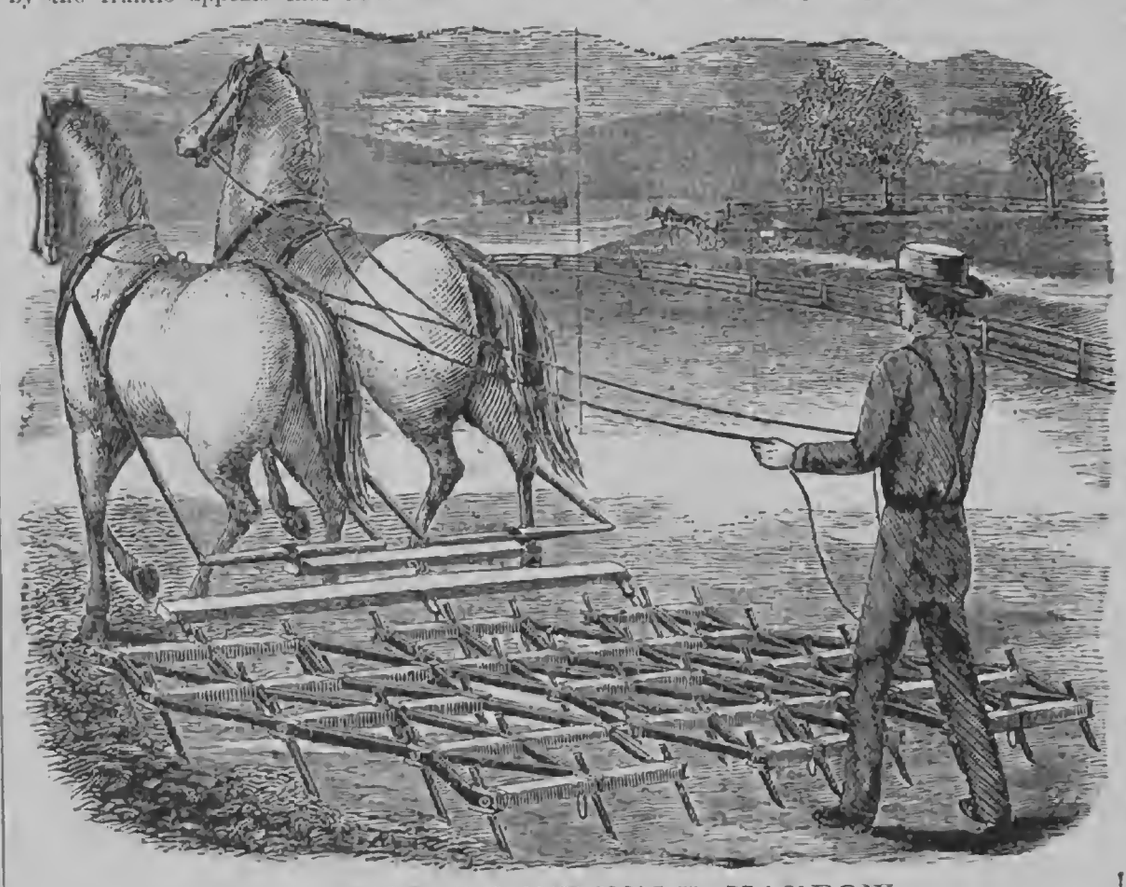
"No, sir; the seed was brought here, and I never saw any here except such as was cultivated."

[In explanation of the Alderman's grammar, etc., I may say he is an intelligent and sensible colored gentleman, who does not put on airs, and who attends strictly to his own business.]

Feb. 10.—The Duval Co. Ag. Society has been making strenuous exertions to prepare the grounds, buildings and fixtures for the holding of the State Fair here, which is to commence Feb. 22. It has been a hard struggle, judging by the frantic appeals that have been made through the papers. If the papers tell the truth, Florida, outside of Jacksonville, is wide awake to the importance of making a grand exhibit of its industrial resources here. The fact is, it is to be a scraping together of the best exhibit the owners of land grants, real estate dealers and land speculators, together with the legitimate fruit growers and farmers, can make. That is what I, with other Northern men, expect, primarily; and if it don't prove so, we shall be very likely to think it a failure; for that is just what we are going to this Fair to see; and you shall hear whether we are disappointed or not.

Don't believe as much Northern money has been spent here this as some previous seasons. The proportion of pleasure-seekers and those who come here simply to escape cold weather and kill time is not as great, I am told, as hitherto. There are more invalids; and these latter are not always rich, as they used to be here.

Feb. 14.—It is really settled spring weather. Peaches and plums are nearly out of bloom; all deciduous trees are making rapid growth. Here by my window is a bunch of my old friend *Sambucus Canadensis* (which, by the way, is cultivated here as an ornamental plant), which has a new growth of two feet. The Mulberries seem in nearly full summer foliage. The pressing query upon me as I travel through the markets is, Where are the Florida truck gardeners! Precious few tokens—and those most miserable ones—of their existence can be seen. But I may yet learn where to look for them.



BRADLEY'S REVERSIBLE HARROW.

The Horseman.

ARAB HORSES.

THE article on Arabia in the second volume of the new edition of the "Encyclopedia Britannica" is by William Palgrave, one of the first authorities upon the subject. A good portion of his article is given to that theme of never-failing wonder, the Arab horse. He says:

"Reared under an open shed, and early habituated to the sight of man, to the sound and glitter of weapons and to all the accessories of life, the colt grows up free from vice or timidity, and even acquires a degree of intelligence that surprises a stranger. Barley and dates are the chief stall provender; but the grass of the pasture grounds, in the selection of which much care is taken, is the ordinary nourishment of an Arab horse. Of water the allowance is always kept purposely scant. A good Nejdee will canter four and twenty in summer time and eight-and-forty in winter without once requiring a drink. Raw meat, dried, is occasionally given in small quantities when extra exertion is required; lucerne grass is employed for lowering the tone. Geldings are very rare. The color most frequently occurring is gray; then comes chestnut; then white and sorrel; mottled gray and black are now and then to be found; dark bay never. Colts are ridden early—too early, indeed—in their third, or even second year, and are soon broken into a steady walk or canter, and to the ambling pace which is a special favorite with Arab riders; racing, an Arab amusement from time immemorial, and the game of "jerzed," a kind of tournament, or mock fight, with blunt palm sticks, highly popular without the peninsula, complete the training as to wind and pace. Saddles are seldom used in Nejd, and stirrups never; but both are occasionally employed in Hijaz and Yemen. So it is, also, with bits, the place of which is taken in Nejd by halter-ropes, the real guidance of the animal being almost wholly effected by the pressure of the rider's leg and knee. Shoes, too, are of rare occurance, nor are they needed in the light sand-mixed soil of the central provinces; on the other hand, the hoofs are rubbed with grease, to counteract the drying effects of the heated ground. Of all niceties of grooming, docking and clipping excepted, the Arabs are masters; and their natural kindness to animals—a quality which they share with most Orientals, together with the care every reasonable man bestows on a valuable article of property.—insures to an Arab horse good treatment at the hand of its owner. But Arab horses do not commonly enter tents, nor play with women and children, nor, in a general way, do they share the family meals, nor are they habitually kissed and cried over, as the imagination or credulity of some narrator has suggested. An Arab flying for life has, indeed, been known to give the only morsel of bread about him to his horse rather than eat it himself—an act in which self-preservation had as large a share as affection. Lastly, the standing prohibition of horse selling from Nejd has really nothing more romantic in it than narrow-minded application of the principles of protective monopoly; in other cases, reluctance to conclude a bargain amply indicates that the offer made was insufficient."

TREATMENT OF HORSES IN WINTER.

A WRITER in the Baltimore Trade Review is of the opinion that horses that have been in the habit of running in the pastures during the summer suffer very much during the winter, for the want of green food to which they have become accustomed. They give evidence of this, he says, by the loss of appetite, by becoming hide-bound, and losing the glossy appearance of their coats. When the coat of an animal loses its gloss and assumes a dry, dull appearance; it is sure indication that that animal needs green food or medicine capable of supplying the place of green food. Green food is much to be preferred, for an animal in such condition, to medicine, for two reasons, partly because it is cheaper and leaves no bad after effects, and partly because it is better, being the remedy provided by nature, and nature is always more skillfull than art in providing natural remedies for natural evils, just as a genuine diamond is of more value than any paste imitation. A couple of carrots, chopped up very small and mixed with the feed of horses, has upon them a very beneficial effect. They are slightly cathartic, and, given two or three times a week to horses standing in stables during the winter, they keep them in good condition, supply to a great extent the need of green food, increase their appetite, and prevent their coats from becoming dry, dull and hard. Horses are very fond of them. When the weather is dry and not very windy, horses that are not much used should, in town, be taken out for exercise daily, and, in the country, should during the day be allowed to run at large in the fields, or they will become cramped and stiff from long standing.

Our Premium Articles.

THE AVERILL CHEMICAL PAINT.

THE weather-beaten appearance of neglected buildings is in spring too often observable even where the best of care has been taken. Severe cold-beating storms of snow and ice affect the looks, if not the durability, of everything exposed to the weather. The bright spring-time, when Nature refurnishes her wardrobes and comes out in new apparel, is, therefore, the time when farmers and householders of every class are most inclined to imitate this laudable example. We presume that as large a proportion as usual of our readers are preparing for spring painting, either of old or new buildings and implements, and to all such we take pleasure in commending the paints made and sold by the Averill Chemical Paint Co., No. 32 Burling Slip, New York. These paints are prepared for use, and every desirable shade can be selected from a card, so that buyers at a distance may get the color they desire as surely as if they were on the spot to examine and test. These paints are sold by the gallon, in various sized packages and at reduced prices. This paint gives a hard, durable finish, is fire and water proof, and not liable to wash by rains even before dry. By closing up every pore of the wood, it excludes all water, thus effectually preserving it from decay. This chemical paint is also only slightly affected by frost, for which reason it retains its fresh and glossy appearance for a long time. Among the numerous recommendations of the Averill Chemical Paint we find the following:

EDITOR OF RURAL NEW-YORKER:—I am much gratified to see in your last number the article on the good qualities of the Averill Chemical Paint, for among the many things that cause people to hesitate, the one, What kind of paint shall be used to paint the house, barn and fence? is the most difficult for most people to decide. I was always in that dilemma until I got hold of the Averill Chemical, five or six years ago: from that time I have used that and no other, and would not pay a man to spread lead and oil if he would furnish that kind of paint (lead and oil) for nothing; for actual experience has taught me that it is cheaper to lay the Chemical than to use lead and oil paint if, as already said, it was given to me.

The Averill Chemical, in a few hours after it is spread, becomes hard and smooth as a mirror; the weather has no effect on it: water slides off from it as easily as it does from a duck's back; two coats of it will cover better and make every way a better job than three coats of the best lead and oil made. N. W. RIKER.

Westfield, Nov. 1, 1875.

From T. G. YEOMANS & SON, (the great Nurserymen,) Walworth, N. Y., Nov., 1875:—We have used your paint largely during the past *six* years, and find it convenient, durable, and in every way satisfactory to us.

From J. J. THOMAS, Esq., Union Springs, N. Y.:—I have used the Averill Paint at different times for the past *seven* years, and find it to cost less, spread easier, cover more surface, and to be *twice as durable* as any white lead paint. It is *especially valuable for barns and out-buildings*, furnishing a cheap, durable and perfect protection.—Nov. 10, 1875.

From Rev. THOS. DRUMM of St. Mark's School, Rochester, N. Y., April 14, 1875:—The paint which I purchased of you *four* years ago and put on my *barns and out-houses*, looks as fresh and glossy as if put on last fall

Orders or inquiries on this subject may be addressed to the Company's Agents, Messrs. SEELEY & STEVENS, No. 32 Burling Slip, New York, whose advertisement appears in another column.

Industrial Implements.

BRADLEY'S REVERSIBLE HARROW.

AMONG the many good things manufactured and sold by the Bradley Manufacturing Co., Syracuse, N. Y., we feel warranted in saying that their new Reversible Harrow must take a prominent position in the large list of agricultural labor-saving machinery. As far as we can judge, the principle is all right, and it seems to supply a want long felt by agriculturists, viz., a good Smoothing Harrow combined with a vertical or straight tooth. By simply changing the team and line of draft from one side of the harrow to the other either result is accomplished. This being a new implement, it is comparatively unknown; but we are informed by the manufacturers that a trial of it invariably results in a sale, which is good evidence that we have not over-estimated its good qualities.

THE FARM ROLLER.—Very often the neglect to use a roller at just the right time involves more loss than the cost of making one. A roller can be cheaply constructed by a farmer with a little aid from the blacksmith, and if carefully housed when not in use it should last for years. It is better to have some not very heavy wood for the roll, so as to get sufficient size to make it turn easily without being too heavy to manage. The frame should be made light but strong, and the tongue made of the toughest kind of wood, as this is the point where breakage is most likely to occur.

Floricultural.

UNCOMMON HARDY SHRUBS.

Weigelas, Roses of Sharon, Deutzias, Forsythias, Philadelphus, Viburnums—we need not particularize further—are as common in gardens as Violets in the woods and Corn Flowers in the fields. They are all fine—many of them faultless it may be. But for the same reason that we do not make beds of the Corn Flower in our gardens ought we to avoid in future selections these shrubs which, greeting us from every garden, have in a measure lost their charms. There is no more reason why our gardens should be furnished alike, than that our houses should be built and painted alike, furnished alike—or that people should dress alike. Indeed, as gardens are mainly objects of beauty, while houses, furniture and dress are mainly matters of necessity—there is stronger reason why gardens should not be copies of each other. Nevertheless, while a week may be taken in the selection of a carpet or suite of furniture—while ladies make *no* account of time in studying how to avoid resemblance to old styles or how to procure garments as different as possible from their neighbors, and yet garments that shall lighten their graces and soften their blemishes into the loveliest possible *ensemble*, their shrubs are selected "upon the spur of the moment," or perhaps *because* they have grown familiar with the same varieties from seeing them in neighboring grounds upon either side—and what of *Nature's* beauties is pretty enough for the neighbor, is deemed pretty enough for them.

We would like to have our readers "shop" a little for shrubs, and to give a moiety of that consideration to having their gardens differ from their neighbors', that they so willingly bestow upon matters of dress. The results, we think, would be quickly observable in the transformation of our gardens into objects of far greater variety and interest.

We mention the following shrubs because we admire them, and because, though far from "new" they are yet rarely to be met with.

Pavia macrostachya.—The *Pavias*, species of the Horse-chestnut, differ from it in bearing smoother fruit and in being of a more dwarf character. *Pavia macrostachya* is altogether distinct and possesses features belonging to no other tree or shrub that we have ever seen or read about. Broader than high, stooling from the root and covering the ground closely, it forms a hemisphere of foliage which, when adorned with its many spikes of fragrant Hyacinth flowers, blooming in July and enduring a long time when most other shrubs have ceased to bloom—few plants will give so much pleasure.

We saw last summer in the grounds of R. B. Parsons & Co., a specimen growing under the shade, 50 feet in circumference, 8 feet high. Mr. H. W. Sargent mentions one in his own grounds (1869) twelve years old, 60 feet in circumference, 8 feet high, bearing (as he wrote) between 300 and 400 racemes of flowers.

It should be planted in extremely rich soil—and, possessing in itself every charm of clustered shrubs—is, of all plants, the best suited to stand wholly isolated.

Rhus cotinus—(Wig Tree, Purple Fringe, Smoke Tree, Venetian Sumach). — Common enough it is true, in many country gardens where it is left to grow as it will, and to assume its own natural, disjointed, crooked-legged habit. It is only when restricted to half its natural proportions, that its beauties, which are all its own, are not marred by its unsymmetrical growth. Thus, though by nature a small tree 12 feet high, by pruning it may be adapted to any plot however small. The flowers, some of which are staminate—some pistillate—some perfect, are small and poor; but the many sterile pedicels that form globular masses exquisitely light and feathery, envelop the shrub as in a fine spray, the leaves breaking through here and there. At first this inflorescence is a pale, delicate green resembling little clouds of mist in front of a green back ground. Towards July it assumes a pink or deep flesh-color, and finally a grayish smoke color. We do not propose by pruning to force a straight growth—this is impossible; but to cover up the lower and larger branches obliterating the natural appearance of a round mass of foliage being upheld by long crooked legs. It is usually hardy, though last winter ('75) killed our young plants to the ground.

Fagus sylvatica heterophylla. The Fern-leaved Beech.—This is a trifle large to mention as a shrub—but the remarkable symmetry of well-grown specimens makes them appear much smaller than they are. Besides they are of slow growth and we may consider them shrubs for the first ten years. In the specimen grounds of R. B. Parsons & Co. (already referred to) is one measuring 68 feet in circumference and about 25 feet in hight. From a little distance it looked like a fine Arbor Vitae—being strictly cone-shaped, the base resting upon the ground as if it had been annually sheared. The foliage is quite fern-like—of a light-green color, and it will bear cutting back to any desired extent. If we could have but half a dozen trees or shrubs, we should be sorry not to include this.

Tamarix.—There is no plant that presents a more marked difference between being left to itself, and cutting the top back every season, than this. In Central Park may be seen many examples of the former. The branches alone are conspicuous—the foliage light, broken and tufty—and they seem to us so far from ornamental that we should cut them down. To secure this shrub in all its beauty, the top should be cut back every Fall. This induces stolons of slender, drooping growth and provides an abundance of its tiny, Erica-like foliage that in graceful, elastic sprightliness is almost unequaled by any other hardy plant. Its flowers appear about the first of August—very minute individually, but so numerous as nearly to divide the shrub between foliage and flowers. They form compound spikes which separately measure about an inch and collectively about a foot. Every branch is thus terminated with fine rose-colored spray. While it grows rapidly and thrives in even poor sandy soil—it seems well adapted to lake-borders or to ill-drained grounds.

Catalogues mention *Tamarix Africana, T. Gallica, T. Indica.* But, having all, we can not distinguish one from another. E. S. Carman.

The Poultry Yard.

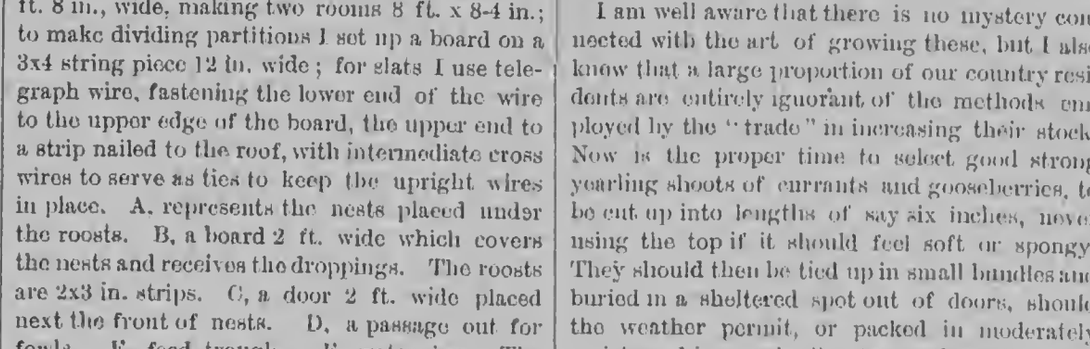
PLAN FOR A POULTRY YARD.

I enclose a rough sketch of Hen house, which perhaps you may think of practical value to some of your readers.

I have attempted to represent a building 20 ft. x 9 ft., the front elevation from sill to eaves 6 ft. 6 in., rear 5 ft., hight from sill to ridge 8 ft., rear distance from ridge to eaves 7 ft. 4 in., making the eaves project 6 in.; front distance from ridge to eaves 4 ft. 2 in., making eaves project 6 in.; projection of gable covering 10 in. Four front window, two each side of the door, the windows each 2 ft. x 4 ft. 4 in., of 7x9 glass, so placed that the distance from the door on the one side, and the corner on the other, will admit a 2 ft. inside swinging shutter to open. Window-sill 18 in. above sill of building. Door 2 ft. 8 in. x 6 ft., ventilator in gable 12 in. x 18 in. of blind slats, with adjustable slide inside. Sills and posts of spruce 3x4 in. Exterior walls and roof of matched boards battened.

INTERIOR ARRANGEMENTS.

Building divided in the center by a passage 2 ft. 8 in., wide, making two rooms 8 ft. x 8-4 in.; to make dividing partitions I set up a board on a 3x4 string piece 12 in. wide; for slats I use telegraph wire, fastening the lower end of the wire to the upper edge of the board, the upper end to a strip nailed to the roof, with intermediate cross wires to serve as ties to keep the upright wires in place. A, represents the nests placed under the roosts. B, a board 2 ft. wide which covers the nests and receives the droppings. The roosts are 2x3 in. strips. C, a door 2 ft. wide placed next the front of nests. D, a passage out for fowls. E, feed trough. F, water jar. The floors to be of cement, and by covering them with hay chaff, it makes a very dry and warm floor,—when chaff cannot be had sawdust is the next best thing. I have yards at each end of building, as it separates the lots of fowls and does not obstruct the light in front, which is so needful in cold weather. Each room will contain twenty fowls of the Leghorn variety or fifteen of the Bramah, and give plenty of room in cold, and the yards make up the extra in warm weather. I have used a 2x3 strip for roosts



POULTRY HOUSE—ELEVATION.

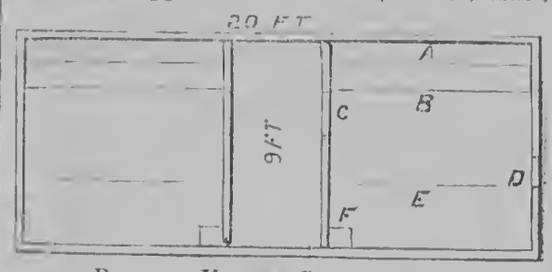
rounded on each edge, and as it is wide and thick the fowls can cover their feet and keep warmer in cold weather. By having inside shutters they can be closed nights in cold weather and keep out a great deal of cold and be a protection against thieves. The expense of building will of course vary with the locality. I find that by using the wire for partitions it makes a much neater finish and is not expensive, as by getting damaged pieces, it can be obtained for two and a half cents per pound, and it does not rust. H. D. Wellington.

East Lexington, Mass.

PARASITES IN BIRD CAGES.

Land and Water prescribes as follows for a very common affliction of caged birds:

"Many a person has watched with anxiety and care a pet canary, goldfinch or other tiny favorite, evidently in a state of perturbation, plucking at himself continually, his feathers standing all wrong, always fidgeting about, and in every way looking very seedy. In vain is his food changed, and in vain is another saucer of clean water always kept in his cage, and all that kindness can suggest for the little prisoner, done;



Poultry House—Ground Plan.

but still all is of no use, he is no better—and why? Because the cause of his wretchedness has not been found out, and until it is, other attempts are but vain. If the owner of a pet in such difficulties will take down the cage and cast his or her eyes up to the roof thereof, there will most likely be seen a mass of stuff looking as much like red dust as anything; and from thence comes the cause of the poor bird's uneasiness. The red dust is nothing more nor less than myriads of parasites infesting the bird, and for which water is no remedy, but there is one easily procurable in a moment—fire. By procuring a lighted candle and holding it under every particle at the top of the cage, till all chance of anything being left alive is gone, the remedy is complete. The pet will soon brighten up again after his house-warming, and will, in his cheerful and delightful way, thank his master and mistress over and over again for this, though slight, to him, important assistance."

The above prescription is good so far as it goes. Suppose enough of these parasites remain on the body of the poor bird to start a new colony? They will repeat the development of their progenitors, and soon multiply indefinitely in the top of the cage. Give the prisoner a very fine dust bath, in addition to the purification of his house, and the cure may be complete.

The Garden.

SMALL FRUIT PROPAGATION.

A writer in the N. Y. Tribune gives these timely hints in regard to the propagation of small fruits:

I am well aware that there is no mystery connected with the art of growing these, but I also know that a large proportion of our country residents are entirely ignorant of the methods employed by the "trade" in increasing their stock. Now is the proper time to select good strong yearling shoots of currants and gooseberries, to be cut up into lengths of say six inches, never using the top if it should feel soft or spongy. They should then be tied up in small bundles and buried in a sheltered spot out of doors, should the weather permit, or packed in moderately moist sand in a cool cellar, to remain until spring. As soon as the frost is out of the ground and the soil has become reasonably dry, open little trenches sufficiently deep to take in the cutting, allowing the topmost bud to remain even with the surface of the soil; fill in a little earth, press the bottom very firm, and level off the trench. If warm, showery weather occurs, the buds start into action immediately, and roots form at the same time. Should a long-continued drouth set in, however, it will be best to place some mulching material along the rows. If the young plants have made a strong growth they will be sufficiently large to set out in their permanent home the next season.

TOUGHENED GLASS.

We have already noticed this invention. When it becomes cheap it will be one of the best insurances we can have against hail storms for our glass-houses. The Boston Journal of Chemistry, referring to it, says:

"Essentially, the process consists in heating glass nearly up to the softening point, and then plunging it into a bath of oil or grease. But to bring it to perfection has needed the patient experience of seven long years. M. Bastie, who is a gentleman of fortune, is said to have made his discovery first some seven years ago. This was after many years of investigation. But though he seemed to have succeeded for the moment, it took two years more of continued experiments before he could repeat his success. The invention has been patented in all European countries, and soon will be throughout the civilized world."

REMEDY FOR THE CELERY FLY.

One of the worst enemies to the celery is a small fly, which deposists its eggs in the leaves, and the young eat their way under the skin, and in this way materially affect the growth of the plant. The English Gardener's Chronicle says:—"I can fully concur with what has been stated by Mr. Tillery as regards soot being beneficial to the growth of Celery and also a preventive to the celery fly (*Tephritis onopordinis*), having experimented with the same with satisfactory results, though instead of selecting a fine day for the operation I selected a showery one. I intended to have written to you before on this subject, as I consider it an easy remedy and of great importance where fine heads of celery are in requisition."

Insurance Department.

INSURANCE NOTES AND NEWS.

Has a Bad Look.—Less than three years have elapsed since the St. Louis Mutual Life Insurance Company, one of the oldest as well as largest companies in the West, suspended business, and was expected, perhaps confessed, to be insolvent. After remaining suspended like Mahomet's coffin for a few months, during which a great number of its policies lapsed, an arrangement was made with another St. Louis life insurance company to join their business and form a great proprietary or stock company. The new company took the name of the St. Louis Life Insurance Company, and with, it is said, a million dollars of capital began business by insuring stock policies in exchange for the old mutual policies of the two coalescing companies. About the time this process—which may be rendered very profitable to a set of sharp managers—was completed, and before it had done much, if any, new business on its own account, the company joins in with the Life Association, another St. Louis Co., elects the same persons to its chief offices, and came under the same management. Though not in very good odor for soundness, the St. Louis Life Insurance Company had a capital of a million dollars as ultimate security, and its policy holders did not proceed with much alacrity to reinsure—for the third time—with the affiliating company. The latest movement is to reduce the capital to $100,000 that is, to take $900,000 from the capital pledged for the better security of the policies. Whether this movement will be regarded as legal or not, it will have the effect to frighten the policy holders and compel them to accept such terms as the reinsuring company may dictate. Amalgamation has put on many ingenious disguises in this State, but this St. Louis business rather caps the climax.

"Leave Well Enough Alone."—The insurance companies of this State are required by law to invest their means in a prescribed class of securities, such as United States and New York State stocks and mortgages of real estate, etc., in this State. The purpose of this enactment was the better protection of the insured by confining the investments of the companies to such as were easily traced and valued. Some of the companies think this law places them at a disadvantage as compared with the companies of other States not hampered by restrictions, and a bill has been introduced "providing that insurance companies may invest their funds in any other State in the same class of securities as such corporations are allowed to invest in in this State." They had "best leave well enough alone." Seven per cent. well secured is well enough, since it is two and a half to three per cent. higher than the rate of interest the companies use in their calculations. This bill may enable some companies to make a little more profit, but it may also open the way to wildcat speculations and no end of trouble. Better not tamper with the laws, especially good, wholesome laws.

Destructive Fires.—A great fire—the most destructive that has occurred in this city in many years—broke out on Broadway on the evening of the 8th of February and consumed several buildings and about $4,000,000 worth of property before it was brought under control. The falling of a wall killed and injured several firemen. Luckily the weather was propitious. Had it been otherwise, a high wind might have carried the flames over a large territory. A recent fire at Rutland, Vt., destroyed one of the largest business blocks, including the principal hotel. This village has such a fire about once every year. Tarrytown, N. Y., had a visitation of the same kind recently, which, as there was no fire department or facilities for subduing conflagrations, did its work of destruction as long as there was material for a fire. The loss exceeds a hundred thousand dollars;—less than half covered by insurance.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

SEEDLING CROWN IMPERIAL AND ROSES.

March 1.—I am in receipt of a letter from a Canadian subscriber to the RURAL NEW-YORKER, who desires me to answer the following questions:

1. Can the Crown Imperial be satisfactorily raised from seed?
2. Can roses be raised from seed, and how?
3. Is the *Eucalyptus globulus* hardy enough to withstand the cold of an Ontario winter?

To the above I will answer:

1. The Crown Imperial can be raised from seed, but whether "satisfactorily" or not depends very much upon the skill and patience of the grower. The seeds of the common species of Lily, Crown Imperial, Tulips, and closely allied plants, are not at all difficult to make grow. But the principal obstacles in the way of final success come up afterward, and unless very great care is bestowed upon the plants, few will reach maturity. A severe drouth or too much water may in a few days destroy the most promising bed of seedlings, consequently there is little use of one sowing seeds of such plants without making provision for future care, or until the bulbs have reached a size to withstand the ordinary vicissitudinous conditions to which they will naturally be liable. Still, the uncertainty of success in raising plants of this kind from seed is in itself a powerful incentive to perseverance and the bestowal of the requisite care, inasmuch as those things which are produced without labor or skill are usually valued accordingly.

The seeds of bulbous plants, like the Crown Imperials, should be sown as soon as ripe, or soon after, in shallow boxes or in beds, in very light, sandy loam or leaf mold from the woods, covering the seeds about a half an inch deep. At the approach of cold weather the seed beds should be slightly protected with a light covering of hay or leaves. In the spring this covering should be removed, and as the plants begin to appear, attention to weeding and watering, wherever necessary, should not be neglected, because the more care given the better the results. If the seed are sown in boxes, there will be less danger from vermin than in beds, but more care will be required in giving water during dry weather. If all goes well, bulbs the size of small marbles will be produced the first season or by midsummer, when they may be taken up and planted out where they will have sufficient room to grow to a blooming size. In transplanting from the seed beds or boxes, it is well to set the bulbs deeper than they were formerly, say two to four inches, according to the nature of the soil. In a light, dry soil, they may be set deeper than in a heavy clay. Nothing further will be required from this time on, except to keep the beds free of weeds and water in time of drouths. It usually takes from three to five years to obtain blooming plants from seed—a time sufficiently long to discourage most persons from making an attempt to raise Crown Imperials and other kinds of lilies.

ROSES FROM SEED.

2. In the autumn, as soon as the seed pods, which are technically called "Hips," or "Heps," are matured, gather them and throw them into some vessel where they will be kept moist for a few weeks, or until the pulp surrounding the seed decays sufficiently to be removed easily by crushing. The seeds may then be washed out or otherwise separated from the pomace; then sow immediately in a bed in the open ground, covering about a half an inch deep. The soil should be made very rich and of a light, friable nature, in order to prevent the surface from becoming hard after heavy rains. The surface of the bed, after the seed are all in, may be covered with sawdust to the depth of one or two inches, or with leaves, as recommended for lilies; these materials, or the greater part should be removed in spring.

Some plants will usually appear soon after the growing season commences, and continue to come at intervals during the entire summer, while a portion of the seed will remain dormant until the following year, and I have known instances where none grew until the second year after sowing, then came forward with great rapidity, consequently one should not be discouraged or destroy the seed-bed if no plants make their appearance the first season. Sometimes the young seedlings will need shading from the noonday sun, especially during a very dry and warm spring. But an occasional examination of the seed-bed will show whether shading is required, for the withered, scorched plants are certain to be found if the sun is too powerful. Watering the beds at night during dry weather may be necessary in order to keep up a vigorous growth. If satisfied in the autumn that only a small part of the seed have grown, either take out whatever plants there are and cover the bed again, or add protection and leave both plants and seeds undisturbed. Plants, when removed from the seed-beds, should be set out where they will have plenty of room to grow and bloom. Very little has been done in this country towards raising new varieties of roses, but there is no good reason why every lover of this Queen of the garden should not annually raise a few or many seedling roses. There is really nothing to prevent the production of new sorts in this country as well as in Europe, but for some reason our professional florists and amateurs have done but very little in this line.

EUCALYPTUS GLOBULUS.

3. This much-talked of tree will not thrive in our Middle States, much less the Northern, or Canada. The well-known nurseryman, P. C. BERCKMANS of Augusta, Ga., reports that he tested not only the *E. globulus* but quite a number of other species, none of which proved hardy in his grounds, but some of them may succeed near the Gulf or in localities where frost seldom occurs.

TROUBLES OF A YOUNG BOTANIST.

March 2.—A young botanist writes me from South Adnams (no State given) deploring the general indifference of the young men in regard to the study of botany and kindred natural sciences. He thinks if the young men who spend much of their time "loafing" about the barrooms of hotels, and groggeries, had some branch of natural science for a "hobby," it would improve their morals and strengthen their mental faculties. No one but the said young men would disagree with my correspondent in this, but we must remember that we need a little shade in order to fully appreciate the unobstructed rays of light. Still there is undoubtedly too much shade in the moral and intellectual world, and if our young men and women could be induced to study science and truth more, and fiction less, the next generation would show a marked improvement upon the present. But to bring about any great change in the habits and customs of a people requires great perseverance and earnestness in the work, upon the part of those who become teachers by self appointment or otherwise, hence just such men as my correspondent must step into the field and do all he can to bring about the much desired reformation.

Boys who have pleasant homes are seldom inclined to spend their leisure hours at the corner grocery or other questionable places, and men who take to science, art or literature, are not likely to have much waste time on their hands. Probably there is no one line of study which will hold a man so steadily as the pursuit of knowledge in any one of the many branches of natural history, for every successive step taken in that direction opens a wider and more fascinating field for investigation than the preceding one. But it must be confessed, however, that few will find such studies lucrative in a money point of view. Mankind, as a whole, have not as yet reached a sufficiently high mental development to fully appreciate the labors of scientists in general, hence we find such men as LINNÉ, HUMBOLDT and AGASSIZ, closing their lives in comparative poverty. Still I fully agree with "Young Botanist," that every young and old man should have a hobby in some one of the various ramifications of art or sciences.

Arboricultural.

BASKET WILLOW CULTURE.

WILL you please inform me through the columns of your valuable paper the best method of cultivating the "basket willow," with the method of preparing the soil for planting, time of planting, harvesting and manner of cultivation, and all the necessary information to enable one having no experience in the business to make it a success.—A SUBSCRIBER, *Milwaukee, Wis.*

The culture of osiers or basket willows is exceedingly simple. Low, moist soil is, of course, preferable to that which is high and dry. The land should be as thoroughly prepared as for any other crop, that is, plowed and harrowed until all weeds and grass are killed out. Then set the cuttings a foot apart, and the rows from four to six feet, in order that the cultivation may be continued among the plants for the first two or three years, as well as to give room for passing between the rows in gathering the crop. The cuttings should be about a foot long, and set in the spring as soon as the ground is sufficiently dry for the purpose.

The heading back, or pruning, should commence the second season after planting in order to secure a number of shoots from each root, even if the first season's canes are not long enough to be of any value. The second season a light crop may be expected, and should be taken off at a time when the bark will peel off readily. The peeling may be done with a machine or by hand, according to circumstances. There have been hundreds of willow plantations started in various parts of the country, though few now remain in a productive condition. Willow culture is not profitable, except where one has a good home market.

EUROPEAN CHESTNUTS.

UNDER the above head "Daily Rural Life," in the RURAL of Feb. 12th, gives some interesting information. But in all the articles which have appeared of late I have failed to see anything in regard to what I consider its worst feature, viz: Its liability to insect depredations.

Out of a dozen or more, all grafted on native stocks and now more than a score of years old, bearing annually abundant crops, we do not get a dozen *quarts* of sound chestnuts. Nearly all wormy. The first we find equal in flavor (either boiled or fresh) to our native varieties, except that the skin around the fruit is quite astringent until dried. Can any one tell me why this variety, European or Spanish chestnut (as we usually call it) is more liable to be thus infested with worms, and this, too, growing as they are among the natives. This is the case every year. When the trees first commenced bearing only a small percentage were thus affected, but the trouble increased yearly. The trees in question have never been injured by cold. We once grafted on native stock a number of grafts from European seedlings which were purchased from an Eastern nursery firm. Not one in the lot proved worthy of propagation, but were entirely worthless—no better than acorns. I should like to know if any others have experienced similar results in regard to wormy fruit who have cultivated the European variety.—E. H. LOCKLIN, *Shepherdstown, Pa.*

The "Chestnut curculio" (*Balaninus*) is more or less abundant wherever this nut is either cultivated or found growing wild, but we were not before aware of its preference for the foreign varieties. We have found the larvæ of this beetle more abundant in the nuts some seasons than others, but it is always plentiful enough to make one a little careful about cracking the nuts with his teeth.

There being quite a number of foreign sorts cultivated by our nurserymen, it is quite probable that the trees you purchased were of some inferior variety. We shall be pleased to hear from any of our readers who have anything to contribute in regard to the cultivation of the native or foreign chestnuts.

MANAGEMENT OF OLD ORCHARDS.

MR. S. T. CARPENTER writes in the Peterborough (Ont.) Times the results of a long experience in fruit growing. He says: Old orchards should be highly manured, and all the ground should be stirred by plowing each and every year. No ground is rich enough to grow two crops at a time. If you have your bearing orchard sowed with rye, wheat, oats or grass, you will fail to have a full crop of fruit, and what you do have will be small and inferior. The more manure the more bushels and the larger and fairer the fruit will be.

Pruning should be done in June. Old dead wood should not be left upon the trees, and no sprouts should be allowed to grow about the trunks of the trees. Only one trunk should be allowed to grow. I would recommend every farmer who has an orchard to buy a grub hoe the first time he goes to town: it is indispensable to keep grass, sods, weeds and sprouts from growing about the trees. Young trees should invariably be kept cultivated in a hoed crop, such as potatoes, corn, beans and turnips, and not heavily manured while growing, or until they come into bearing, as doing so would be to force an unnatural growth, and hence they would be likely to freeze out and die. Order no Baldwins, R. I. Greenings, Roxbury Russets, 20 ounce apples, 20 ounce Pippins, Holland Pippins, fall Pippins, fall Gennetings, King of Tompkins County, Esopus Spitzenbergs, Golden Sweets, Sweet Bough and Early Harvest, as these varieties sooner or later will freeze out and die in this locality. They are too tender. The best upland upon the farm should be selected for the orchard. Hardwood timbered upland is the most natural and best for orchards.

Young trees planted in rye, wheat, oats, or grass should, as soon as they are put out, be heavily mulched in with coarse straw manure four or five inches deep around the trunks of the trees, and as soon as the crop is removed put in the plow and stir the whole ground and loosen the earth about the trees; this will insure a good fall growth. In planting young trees put them down two or three inches deeper than they originally stood in the nursery. If the soil is a dry, sandy loam, puddle the trees by putting a pail of water in each hole while the trees are in. Be careful to straighten all the roots out naturally, and if a light soil tread the dirt as hard as possible after the roots are covered all the way up, leaving the ground hollow about the roots of the trees, so that the water may not run off when it rains. Never pour water upon the top of the ground about the roots of the trees, as it will injure them and never gets to the roots. If a tree stands green and does not come out in leaf, take the dirt away down to the roots, be careful not to disturb the tree or the roots, and pour on a pail of hot soapsuds directly upon the roots, or, in the absence of this, a pail of soft water or creek water will do, and then replace the earth; repeat every three days until the tree comes out in leaf. I would recommend in conclusion to plant your orchard thirty feet apart each way, which will require 48 trees to the acre, all the ground can stand when they are fully grown. Order none but hardy varieties.

WATER-SHOOTS FOR CIONS.

A FEW days ago I cut some cions from the long, straight shoots that had grown last season from a large branch, the end of which had been cut off. An experienced grafter told me they were not good, and said the grafts would grow rapidly but would become slender, sucker-like branches that would not produce fruit. Will some one who understands the subject please answer through your columns.—A SUBSCRIBER.

WE presume you refer to the large, thrifty sprouts, which on old apple trees sometimes spring from near the base of the large branches, technically termed "water shoots." These are not generally considered as good for cions as the shoots growing from the ends of the branches, as they are more likely to grow soft, spongy, and the buds poorly developed. But if they have not been injured by the cold of winter, and grow when inserted into the stock, there need be no fear of unproductiveness. When short of better wood for cions we have frequently used these water-shoots with apparently as good results as those from other portions of the tree. No experienced pomologist would recommend the use of such shoots for cions, except in cases of great scarcity, still they are not wholly worthless, and, under proper management, grow and produce good trees.

The Vineyard.

GRAPE GROWING IN THE SOUTH.

E. O. NORTHRUP writes in the Rural Sun a very flattering account of the success and profits of grape culture in Tennessee. The subject is viewed in roseate colors, reminding us of the stories told years ago of Northern vineyards when grape growing was in its infancy. The price of grapes in Northern cities has ruled very low for several years, and the extraordinary profits formerly secured have not been obtained. Still, even at low prices, grapes pay as well as other farm produce, and better than most. In the South we judge that there will be no trouble from lack of ripening, and the price of grapes for a few years will be higher than prevails here. With the comments we give the correspondent's letter:

I have myself made five tons of grapes from an acre, and the very same acre would this year (now in other hands) have made the same quantity, but the wet season has, for the first time in ten years, caused the Concord to rot with us on the Mountain. And this brings us to the question of varieties to plant. As far as I have tested I can only recommend two: the Concord and the Ives Seedling. The Herbemont, Cynthiana and Norton's Virginia have not been tested. I hope they will soon be. For vineyard culture I recommend the Hartford, Diana, Perkins, Eumelan, Clinton or Delaware. The latter I would always have a few of, and where they do well are very much liked by most people. The old Catawba and Isabella are very good, but too uncertain to be profitable.

On an average my one acre of vineyard has paid me five hundred dollars a year profit after coming in bearing. I, however, was a pioneer in the business and realized more than others need expect to. At present there is a lively demand for grapes, which would sell readily, wholesale, at $120 per ton. With a crop of three tons to the acre the clear profit should be at least $300 a year.

A great many vineyards are now being planted in this neighborhood, and I expect in a few years over 150 tons will be annually produced in this vicinity.

WINTER GRAPES.—How many farmers have fresh grapes at this season of the year? With a little care, it is possible and easy to have some of the late-keeping varieties in good order till March, April, and even into May. The Agawam, Salem and Wilder are among the best keepers, and as their vines are perfectly hardy and the fruit ripens early, they ought to be favorites in the vineyard even for use when other grapes are in their prime. Plant some vines of these varieties the coming spring and they will fruit in two years from next fall.

Domestic Economy.

SPRING HOUSE CLEANING.

When houses are infested by cockroaches, they can be kept away by powdered borax. Keep it in a tin pepper box and sprinkle it wherever they go. Paris green is recommended, but it is a poison; while borax is harmless. Sprigs of wintergreen, or ground ivy, will drive away small red ants, and branches of wormwood will make black ants "vamose the ranch."

Scald your bedsteads in the hottest soapsuds you can apply; if there are traces of bugs apply kerosene with a small paint brush. It is a sure cure. Tenants of city houses are often annoyed by bugs, and cannot tell whence they came. Perhaps the border of the wall-paper might divulge their source, or the cornices of the windows disclose their haunts. Again apply kerosene and they will no longer trouble you. Carbolic acid may be applied; if pure, the odor is not as disagreeable as that of coal oil. Papering and painting are best done in cold weather, especially the latter, for the wood absorbs the oil of paint much more than in warm weather, while in cold weather it hardens on the outside, making a coat, which will protect the wood instead of soaking into it.

FOR HARD SOAP.

The Housekeeper gives the following:—Four pounds grease, one and one-half pounds resin, one can condensed lye, one-half pound sal soda makes ten pounds superior hard soap. Dissolve a pound can of condensed lye, or ready soap-maker, in six quarts of soft water (hot). Put four pounds of clean grease into a kettle, add two quarts of the lye, two quarts of soft water, and boil thirty minutes. Then add three quarts lye, a little at a time, so as not to impede boiling, which continue from two to five hours, or until it becomes soap, which may be tested by cooling in a spoon. Then add the resin (broken small), putting in remainder of lye slowly so as not to stop boiling, which continue thirty minutes. Then add a teacupful of salt, boil until the soap is separated from the lye and strings. When cooked in a spoon it should be hard. After standing twenty minutes, dip the soap into a deep tin dish or mold, and stir in a half pound of melted sal soda. If perfume is desired, stir in a little oil of rose, sassafras, or any other. When cold cut up to suit. The success of soap making lies principally in the proper equivalents of grease and lye. All pork grease, or all tallow is not as good as half and half, mixed.

WASHING FINE UNDERCLOTHING.

The Germantown Telegraph says:—A leading firm, importers and retailers of hosiery goods in this city, gives us the following directions for washing merino, lamb's wool and silk underclothing, and we print it at this time as being in season to be adopted. From our own experience we can testify to its excellence:

"Use one pound of dissolved soap in four gallons of warm water, in which well rinse the articles to be washed, drawing them repeatedly through the hand; wring them as dry as possible, to remove the soap; rinse them again briskly in clean, lukewarm water; wring and stretch them to their proper shape, and dry in the open air if possible. The only effects of rubbing are to shrink and destroy the material; it should therefore never be resorted to.

"The material used in manufacturing silk underwear being an animal product, it is absolutely necessary that nothing but the best quality of soap and warm water should be used. All kinds of washing compounds destroy the nature of the material, giving to the fabric the appearance of poor cotton."

A WEEK'S BILL OF FARE.

The following week's bill of fare is taken from the note-book of a city lady, and is adapted for a small family of say five persons. Besides the articles enumerated in the list, are to be included for breakfast, oatmeal or crushed wheat, milk toast, corn cakes, tea, coffee or cocoa, and for dinner the usual vegetables in season:

Sunday—Small steak for breakfast. A large turkey with vegetables and other accompaniments for dinner.

Monday—The same grilled for breakfast and in a fricassee for dinner.

Tuesday—Chops for breakfast. Dinner—Beef soup with plenty of vegetables, and bread pudding dessert.

Wednesday—Breakfast—Ham and eggs. Dinner—Corned beef.

Thursday—Breakfast—Hash. Dinner—Soup and cold corned beef, with dessert.

Friday—Fish for breakfast and dinner.

Saturday—Breakfast—Veal cutlet and buckwheat cakes. Dinner—Beefsteak and fried potatoes.

SELECTED RECIPES.

Furniture Polish.—Equal proportions of turpentine, linseed oil, and vinegar, thoroughly applied and then rubbed with flannel, is an excellent furniture polish.

Boot Blacking.—To make a good and cheap boot blacking take ivory blacking two ounces, sweet oil, one-half tablespoonful, and brown sugar one and one-half pounds. Mix them well, and then gradually add one-half pint of small beer.

Mock Cream.—Boil one pint and a-half of milk, sweeten and flavor to taste. Beat three eggs very light; add to them three heaping teaspoonfuls of flour, and a teaspoonful of salt. Stir this into the boiling milk. Spread this, when cold, between two layers of the cake as made for Washington pie, and you have a nice cream pie.

Butternut Cake.—Four eggs, beaten separately; two cups sugar, one of butter, one cup butternut meats, one half cup sweet milk, two and one-half cups flour (heaped), one teaspoonful soda, two of cream tartar. Rub the black scales off from the meats before putting them in the cake. Bake in two loaves.

Snow Pudding. If there should be a fall of snow this winter, some of your readers may like to try this receipt. Where cold, dry, fresh-fallen snow is used it gives a lightness to the cakes all its own; no amount of beating can rival it. Make a stiff batter with four ounces of flour, one-fourth pint of milk, or more if required, a little grated nutmeg, and a pinch of salt. Divide the batter into any number of pan-cakes, and add three large spoonfuls of snow to each. Fry lightly in very good butter, and serve quickly. The pan-cakes should be about the size of a soup-plate for the indicated quantity of snow.

Hygienic Information.

RESTORING LOST HEALTH.

In the Rural New-Yorker of Dec. 18, I read with much pleasure the notes of C. D. Bragdon on Florida. His remarks in relation to consumptive invalids reminded me of my condition in 1847-8. I then had all the distressing symptoms of consumption and did not expect to live long. I could not go to a warm climate, as some advised; I had no means to support me there, and I now think it was better for me to stay in my own quiet home.

I had taught school, to do good and obtain my living (not a very lucrative employment at that time); but I loved the work, and kept at my post so long as I could. When I ceased teaching my lungs and throat were sore, cough frequent, and attended with hemorrhage quite often. I loved to live, and in the retired home of my widowed mother I sought rest from society and studied the best means of restoring my health.

My mother had for several years suffered with a severe cough, but had strength to do a good day's work after she had recovered from a severe coughing spell and had cleared her lungs of superfluous matter. My mother had been accustomed to muscular exercise in purer air than I had breathed. I had exercised the muscles of the voice, lungs, etc., in the foul air of the school room, and my whole system had become weak for lack of healthful, muscular exercise in pure air. This exercise and air I could obtain at home far better than away, while I could also obtain needed rest and more freedom. I could also regulate my diet better. These things are of far more importance than many suppose.

Time has passed, and while I have been studying and, in a measure, teaching the laws of life and health, I have done much hard work; and if the readers of the Rural New-Yorker wish to know how I managed, I will write more on this subject hereafter. Hattie Hopeful.

CHILBLAINS AND FROST BITES.

These are two of perhaps the commonest ills incident to farming humanity, and, next to toothache, probably the most troublesome. They are thus diagnosed and treated by Dr. Hall in a recent interesting contribution to the Christian Weekly: "The chief symptom of the chilblain is a troublesome itching; it sometimes disappears of itself, but, if neglected, often returns for years on the approach of very cold weather. This affection would never manifest itself if the feet were always comfortably warm; or, if getting very cold, they were brought back to their natural condition by drawing off the stockings a yard or two from the fire or stove and patiently rubbed with the hands first, and then with a rough woolen flannel, more or less warmed, so as to gradually invite back the heat. A young lady returning from the Central Park, where she had been skating, found one of her feet stiffened with cold. She was advised to put it in warm water, which resulted in inflammation, mortification and amputation.

If the skin of the blain is unbroken, melt an ounce each of resin and beeswax in three ounces of sweet oil, and when thoroughly melted and stirred up, stir in half an ounce of calomine, a preparation of lead found at the drug stores; this forms a kind of ointment, which should be gently and patiently rubbed into the part night and morning with the warm finger, until all unnatural appearance of the skin is removed.

Another method is to paint it over with collodion, which is gun cotton dissolved. This soon dries into an impervious covering, perfectly excluding the external air, and, if not disturbed, recovery soon takes place.

If broken, wash the parts night and morning with half an ounce of blue vitriol dissolved in half an ounce of water, kept in a glass bottle for use; rub in a teaspoonful of this night and morning, and, when dry, rub in patiently with the finger some ointment, pain-killer, glycerine, or hog's lard. In old persons and others of a feeble circulation, this ailment, simple as it appears to be, is liable to cause ulceration, mortification and death.

FROST-BITE.

The blood first becomes stagnant by cold, which, if continued, causes the part to freeze, known by its becoming very white, the person not being aware of it until informed by some one whom he chances to meet. The remedy is to rub it gently with snow, for it is as brittle as glass and more easily broken off; in two or three minutes, or just as soon as some feeling in it is noticed, use a little warm water, rubbing it in gently, a little warmer every three minutes, until the circulation is fully restored and the part has regained its natural feeling. If snow cannot be had, use ice water, as it is slightly warmer than the frozen part, and proceed as before.

If a person is found frozen and nearly dead, remove the clothing instantly on the spot, envelope the whole body in snow or ice water, except the nostrils and mouth; as soon as any sensibility is observed, take the body out, rub it gently with cloths dipped in ice water until the muscles begin to relax; remove the body to a cold bed, cover it over, and with warm hands under the cover diligently rub the whole skin, two or three persons at once, for hours at a time if necessary. As soon as signs of life appear, give an injection of camphor water, a teacupful, and put several drops of spirits of camphor on the tongue; as soon as the patient begins to notice anything, give him a teaspoonful of strong warm coffee, in five minutes another, and in ten minutes more half a teacupful, hot. It would be a humanity to impress these things on the minds of the young, as it might put them in the way of saving some valuable life in the course of years.

MILK DIET.

"I find by experience," says Dr. H. N. Chapman, "that lime water and milk is not only food and medicine at an early period of life, but also at a later, when, as in the case of infants, the functions of digestion and assimilation have been seriously impaired. A stomach taxed by gluttony, irritated by improper food, inflamed by alcohol, enfeebled by disease, or otherwise unfitted for its duties, as is shown by the various symptoms attendant upon indigestion, dyspepsia, diarrhea, dysentery and fever, will resume its work, and do it energetically, on an exclusive diet of lime water and milk. A goblet of cow's milk, to which four tablespoonfuls of lime water have been added, will agree with any person, however objectionable the plain article may be, will be friendly to the stomach when other food is oppressive, and will be digested when all else fails to afford nourishment. Of this statement I have had positive proof in very many cases.

"The blood being thin, the nerves weak, the nutrition poor, the secretions defective and excretions insufficient, the physician has at hand a remedy as common as the air, and as common, almost, as water. In it all the elements of nutrition are so prepared by Nature as to be readily adapted to the infant or the adult stomach, and so freighted with healing virtues as to work a cure where drugs are worse than useless."

CURE FOR LOVE OF LIQUOR.

At a festival at a reformatory institution, recently, a gentleman said of the cure of the use of intoxicating drinks:—"I overcame the appetite by a recipe given to me by old Dr. Hatfield, one of those good old physicians who do not have a percentage from a neighboring druggist. The prescription is simply an orange every morning a half hour before breakfast. 'Take that,' said the doctor, 'and you will neither want liquor nor medicine.' I have done so regularly, and find that liquor has become repulsive. The taste of the orange is in the saliva of my tongue, and it would be as well to mix water and oil as rum with my taste."

The Herdsman.

POTATOES AS FOOD FOR STOCK.

Owing to the low price this winter, many farmers are feeding a considerable portion of their potato crop to store and fattening cattle. Where only the small potatoes are used the value is less, as many small tubers are unripe and contain only a small proportion of starch, in which the nutritive value of potatoes mainly consists. Where good, well-ripened potatoes are fed, they are estimated to be worth from 15 to 25 cents per bushel, with corn at 75 cents. The variation in value depends upon the kind of stock fed. For milch cows they are worth more in the absence of succulent food; but even for fattening cattle the value is considerable. In some cases steers are being fattened on hay with potatoes, and no other food; but in a majority of instances corn meal or grain is added. The potatoes are found to improve the digestion and enable stock to eat more with greater proportionate gain than if fed on dry food exclusively. They are always fed raw to cattle and sheep, and in many cases without cutting. It is found that where cows are choked by eating roots, it is when they are suddenly placed before a quantity, which they eat hurriedly and in constant fear of being driven away. When fed quietly with what potatoes they can eat after filling up with other food, no difficulty occurs. Some farmers, however, take the precaution to run them through a slicer. An ordinary cutting-box for hay will do very well, and will leave the roots in a pulpy mass, easily and greedily eaten by any kind of stock. It is the work of only a few minutes to run through several bushels of potatoes, or enough to feed an ordinary herd a day.

IS SALT NECCESSARY FOR CATTLE.

This question has been almost interminably discussed and without definite result. The latest contribution is an article by O. C. B. of Fredonia, N. Y., in the Country Gentleman, from which we quote:

Mr. Hardin's statement that salt is not necessary for cattle, is being much discussed here. If you were to put the question to a Chautauqua County man, he would disagree with Mr. Hardin, and would back himself up against the fact that the most successful dairymen here are very careful either to salt cows every day, or to keep a quantity where they can help themselves at will. Therefore, if the "general practice of our most successful dairymen," is to be taken as the highest authority then that settles the question.

But, then, some one may put the matter this way:—"Suppose your most successful dairymen should take exactly the same care of cows, and give them the same feed (except they leave off salting them), might they not do just as well—produce just as much butter—and live just as long or longer?" I should have to answer that I do not know; that such an experiment has not been tried here that I know of. Now, Mr. Hardin succeeds in the care of animals without salting. But then, perhaps, the case may be different there in Kentucky. Perhaps the water there, which the animals drink, contains a sufficient quantity of salt. It is not safe to say that because he succeeds there that we could here, without first analyzing the water used in both localities. If it should be found that in his wells every 100 pounds of water contains from 2 to 3½ oz. of salt (chloride of sodium),—that being about the quantity of water drank daily by each cow,—then it would follow that in reality his (Hardin's) cattle were being salted, in that way, about as high as the dairy cows of Western New York.

Before it is quite safe to put this matter down very dogmatically either way, it will be best to first procure the analyses of water consumed by cattle in the different cattle growing sections, and to have a series of experiments conducted in different sections by placing in each section herds of cattle upon exactly the same diet and care, except that one herd shall be fed salt and the other not, for the season, and then note the results. If it should be proved that salt is a superfluity with stock, it will be worth a great deal to us, and our Chautauqua county dairymen will have to own up beaten (myself with the rest); while on the other hand, if it should prove to be a fact (as I believe it is), that cattle need, and do better with salt; then Mr. Hardin will have to put on his hat and "step down and out" on the salt question.

THE HERD BOOK.

The Buffalo Live Stock Journal says:—We learn that the Herd Book for 1876 will show a goodly increase in the number of animals registered. The bulls number 3,400 against 3,000 in last volume, and probably 300 will be added in the supplement to bulls. Supposing the cows to retain the bull proportion, the increase in number of registrations will be fifteen per cent. at least. This with the ten per cent. increase in price per head, during 1875, makes an encouraging showing for this stock.

"PROGRESS AND IMPROVEMENT."

THE CENTENNIAL DAIRY RING.

The tendency of the age in the United States seems to be to Rings. We have seen the rise and fall of the Tweed Ring and the Whiskey Ring, but never should have supposed that a Dairy Ring was among the possibilities. It is well known that the Dairymen at their various conventions have agitated the project of a grand dairy display at the Centennial. Among others we have warmly urged this movement as due to so important an interest which represents a vast capital, and an annual product amounting to over $600,000,000. We had hoped and believed that every one favoring this great national dairy display, would enter upon the work with *clean hands*, and that no underhand trickery would be attempted or allowed. But it seems otherwise—as will be seen from the following:

At the late meeting of the American Dairymen's Association at Rome, a committee of some 50 persons from New York and other States, was appointed to raise funds for building a model Cheese and Butter Factory on the Centennial Grounds, and for bearing the other expenses necessary to a proper and complete display of dairy products at the Centennial. Mr. J. V. H. Scovill of N. Y., was Chairman of this Committee, and O. S. Bliss of Vermont, Secretary. But five members of the Committee, desiring to absorb all the honors and emoluments of this great National display, form themselves into a ring to accomplish their object. They meet at Utica, ostensibly to consult with the chairman, but without the knowledge of other members of the committee, no notice of the meeting being given, and they proceed to vote themselves into the most important places of honor and trust growing out of the display. The Board of Auditors was thus secured, Mr. L. B. Arnold and T. D. Curtis, of the immortal five, are recommended as Jurors, the Salary of a Juror being $1,000.

This work being accomplished a letter of recommendation was easily obtained from Gov. Seymour for the Aspiring Jurors, he supposing the meeting to be a full meeting of the Committee, held in regular form and after due notice. Thus it was hoped by the Ring to "steal a march" on the Committee and have the appointments made by the Centennial Commission before any regular and general meeting of the Committee could be had.

Now, when the Secretary, Mr. O. S. Bliss, was ordered by this Ring to record the proceedings as that of a regular meeting he declined to do so, holding that neither he nor other members of the Committee were informed or knew of the meeting, and he very justly denounced the whole thing as irregular and without warrant. The facts becoming known, the New York State Dairymen's Association at its annual meeting also denounced the action of the Ring, and by resolution pronounced the recommendation of Jurors as premature, asking the Committee of the Whole which had been called at Philadelphia, Feb. 23, to reconsider these fraudulent proceedings of the clique.

At the Philadelphia meeting of the Committee, which was regularly called and which was pretty well represented, when the Secretary presented the minutes of previous meetings he gave a statement concerning the irregular proceedings referred to, and said he did not feel willing to indorse them, and asked instructions from the Committee present. Hereupon a long and excited discussion followed, which consumed the morning and afternoon session, the Ring urging the indorsement of the irregular meetings. A vote being taken on the question they were pronounced irregular and ordered to be stricken out of the minutes. Near the close of the evening session, however, word was passed round by the members of the Ring that Gov. Seymour's letter of recommendation had been sent to the Centennial Commission, and so some of the members, out of courtesy as they supposed to Gov. S., were willing to indorse the fraud and thus on a vote the work of the afternoon was reconsidered.

At a meeting of the Committee the following day a resolution was offered by Mr. Chamberlin of Ohio, recommending, as an additional Juror, John Anderson of New York City, who is universally acknowledged as the best judge of cheese in this country. As the West wanted a representative, Mr. Stephen Favill of Wisconsin, President of the Northwestern Dairymen's Association, was also included. The Ring opposed the resolution, and by the aid of Mr. Arnold who voted to exclude all others but himself as a Juror, it was lost, the vote being a tie, 5 for and 5 against. Mr. J. H. Reall of Phila., a noisy and garrulous member of the Committee, went in with the Ring with loud talk and scheming, much to the disgust of the Committee, several of whom left before the sessions were closed.

We regret exceedingly this state of things, as we have been earnest and sincere in advocating a grand display of Dairy Products at the Centennial. We shall go on doing all in our power to provide for and further this display. We know that the great majority of the Committee are upright, true men, who have the best interest of the dairy at heart, and who are opposed to all ring combinations, and we have faith that hereafter any attempt to run the dairy display of the Centennial in the interest of a Ring will be signally rebuked. We hope the dairy display will be one of the most attractive features of the Centennial; and if the Centennial Commission shall appoint as Jurors such men as John Anderson or John Orpe, or Mr. Folsom of New York City, or Mr. Rape of Ohio, or Mr. Favill—men of undoubted integrity, and distinguished as experts in their judgment of dairy goods—we shall get fair awards and there will be no dissatisfaction among dairymen.

BEGGING COMPLIMENTS.

The milk of human kindness in the bosom of the commonly genial editor of the Rural New-Yorker's Department of Dairy Husbandry must have soured a little. In his report of the Vermont Dairymen's Convention, he has no word of recognition for his worthy co-laborer, Prof. L. B. Arnold, who was also present at the Convention, who made an address there, imparted freely of his valuable knowledge, and was handsomely recognized and indorsed by complimentary resolutions. We should think the omission accidental, simply, if we did not know that a similarly marked omission has occurred in every report of Dairymen's doings where Mr. Arnold has taken part, which the R. N.-Y. has printed of late years.—*Am. Rural Home.*

The above is an amusing specimen of the manner in which compliments are begged in these days. If friend Hopkins of the Rural Home will look over the Dairy reports of the Rural New-Yorker, he will see that the charge made is entirely gratuitous and without foundation. We call his attention to the report of the Pennsylvania Dairymen's Convention in January last, in which Mr. Arnold is mentioned in these columns in very complimentary terms.

At the Vermont Dairymen's Convention Mr. Arnold *did not* give an address, the Rural Home to the contrary notwithstanding. He was called upon to answer questions, which we suppose he did in his usual happy manner, though we did not hear them, not being present at the first day's session of the Convention when they occurred. In regard to the complimentary resolutions passed to Mr. Arnold at the Vermont meeting, we think the least said by the Rural Home the better. The facts, as we are informed, are, that Mr. Arnold and one or two New York friends came to the Vermont Convention and begged the privilege from the officers, of introducing complimentary resolutions as an offset to the severe censure passed upon Mr. Arnold by the Northwestern dairymen at the recent Illinois Dairy Convention. The privilege was rather reluctantly given, and Mr. Arnold's New York friend drew up a series of resolutions and a Vermont dairyman was obtained to offer them to the Convention. We do not approve of such "*put up jobs*," and therefore made no comment on the resolutions. We are friendly to Mr. Arnold and have helped him in many an emergency, but we can be no party to such petty deceits to mislead the public. X. A. W.

New Kind of Wheat.—The Gipsy Wheat, a new white chaff bearded variety, is proving popular in Kansas. Col. R. C. Bates of Marion Center, Marion Co., raised, the past year, twelve acres, which averaged 37 bushels per acre. It is a winter wheat, was drilled in Sept. 15th, 1874, and harvested June 20th, 1875.

A MEAT FAMINE IN ENGLAND.

Owing to various causes, and especially the prevalence of foot and mouth disease, the growing and fattening of animals has been an unprofitable business for English farmers the past year or two. The result is that the number of domestic animals has decreased, and meat of all kinds has been scarce and dear. It is said that there are fewer cattle and sheep in England than has been known before in many years. The effect of this must in time be felt in a scarcity of butter and dairy products, and to some extent of wool. In this last item Australia and New Zealand are strong competitors, but in cheese and butter American dairymen will have the room partly vacated by the falling off of the English product mainly to themselves. Improved dairy processes belong to a more advanced condition of farming than is common in New Zealand or Australia, and even the best butter or cheese would hardly bear transportation so great a distance and be in good condition to satisfy the English market. Hence our dairy interests cannot fail to be favorably affected by this inability of English farmers to keep their usual amount of dairy stock.

How serious this deficiency is may be inferred from the scarcity and high price of all kinds of meats, amounting almost to a famine. The prohibition of importation of foreign cattle has created much dissatisfaction among workingmen, to whom the high price of meat operates as a deprivation of their accustomed luxury. On the 2d of February an immense meeting was held in Exeter Hall, London, protesting against the high prices of meats, and the Mark Lane Express of Feb. 7, reviewing the market, congratulates its readers on the successful importation of fresh dressed beef from the United States, and says there is no doubt that this business will be extended. In the meantime, for years to come there is likely to be a steady and increasing demand for American-cured meats, both beef and pork, and for such dairy products as we have to spare. This is a business in which our farmers know no limit, except in the ability of their foreign customers to pay remunerative prices. We can in five years double the value of both dairy products and of meats exported, and from present indications we are quite likely to do so.

RURAL NOTES AND QUERIES.

About Soiling Stock.—A new subscriber to the Rural New-Yorker in Conn., who has been taking the paper from a news agent since the 1st of January, wishes us to give him some information about soiling cattle. To give the best results the preparations for soiling should have been commenced last fall, with rye sown on a piece of rich ground for the very earliest spring feed. Lacking this, our correspondent ought to have some clover, which, in Connecticut, he can begin to cut by the 1st of June, or possibly a little earlier. As soon as the weather is warm enough, he should drill in some sweet corn on a very rich soil or well-manured piece of ground, and make successive plantings until the first of July. This drilled corn will yield a much greater amount of feed than the clover, though if the clover plot is rich and well seeded, successive cuttings may be made every four or five weeks, through the season, and four, five or more tons of feed be cut. The great requisite in soiling stock is to have the ground rich, as it does not pay to cut and carry feed on poor ground. In some cases partial soiling is advisable, supplementing the green food with bran, corn meal, or such other feed as may be found most economical. In other cases cows may be partially pastured and fed with cut food as pastures fail. This is very often done when no intention exists to begin the practice of soiling. It probably will not pay in Connecticut to soil any cattle other than milch cows, unless our correspondent has fancy stock of some kind. The mere growth of stock will not pay for so much labor. The increase of milk and the possibility of holding a steady supply through the hot, dry months, may make soiling milch cows profitable. The main advantage of soiling is in saving and increasing the manure pile, and in encouraging farmers to provide a liberal feeding in seasons when cattle at pasture often suffer.

The N. J. Cranberry Growers' Association held its recent annual meeting in the State House at Trenton, with the Rev. Dr. J. H. Brakeley in the Chair. The minutes of the previous meeting having been read and approved, Mr. E. W. Crane, Chairman of the Foreign Trade Committee, made an interesting report. Other reports were made, showing the extent and importance of the Cranberry Trade of New Jersey. The following Board of Officers was elected:

President—Rev. J. H. Brakeley, Bordentown. Vice-Presidents—James A. Fenwick, New Lisbon; Dr. E. S. Merriman, Bricksburg. Sec. and Treas.—A. J. Rider, Trenton. Ex. Com.—Rev. J. H. Brakeley, Bordentown; A. J. Rider, Trenton; E. W. Crane, Caldwell; N. R. French, 180 Reade St., New York. Representative in State Board of Agriculture—E. W. Crane, Caldwell. Statistician—N. R. French, 180 Reade St., New York. Corresponding County Secretaries—Ocean County, Julius Foster, Bricksburg; Burlington County, Theodore Budd, Pemberton; Atlantic County, Rev. J. L. Scott, Hammonton; Gloucester County, M. M. Chew, Williamstown; Monmouth County, Samuel Conover, Freehold; Middlesex County, F. L. Buckelew, Jamesburg; Camden County, Job Braddock, Haddonfield; Cape May County, Thomas Beasley, Cape May Court House.

Stocking Lake Erie with White Fish.—The work of replenishing the inland lakes with fish is making excellent progress. For the large lakes there is no better fish than the white fish, which used to be abundant from Michigan to Ontario. Of late the number has largely decreased. The Fish Commissioners of Ohio, Michigan and Canada are hatching out myriads to re-stock Lake Erie. One and a half millions have been set loose by the Ohio authorities. Seven to eight millions will be turned into the river at Detroit from the Michigan Hatchery, and twelve to fourteen millions from the Canadian Hatchery opposite Detroit. In three or four years Lake Erie will probably be as well stocked with white fish as ever.

Large and Prolific Corn.—Last year produced some extra-large specimens of corn. The quality was generally poor, however, owing to the cold and wet season, but larger ears were never before seen. Mr. Reuben Barnett of Clermont County, O., had three ears which shelled out, respectively, as follows:—No. 1, thirty rows, with 1,582 grains; No. 2, thirty-two rows, with 1,120 grains; No. 3, thirty-six rows, with 1,296 grains. It will be noticed that the ear with thirty rows produced more kernels than those with thirty-two or thirty-six rows. Probably more grain was never grown on one ear than on the best of these specimens.

Arbitration vs. Law.—The requirement that Patrons shall settle their difficulties by arbitration instead of going to law, works well in Iowa. In several Counties where courts had met, the dockets were examined and not a case appearing for trial, an adjournment was had the same day. The lawyers were glum; but farmers took a different view of it, as in many cases they saved hundreds of dollars by avoiding expensive litigation. With such beneficial results, and continuously increasing membership throughout the country, the Patrons of Husbandry may well smile at the absurd talk about the collapse of the Grange.

What is Seed?—It is worse in England than in this country. The London Agricultural Gazette can only get so far in its definition of seed as to call it "something in a bag."

RURAL BREVITIES.

A Minnesota man says that the eggs of the hateful grasshopper cannot be frozen out.

A corn-starch factory at St. Josephs, Missouri, makes in the course of the year 350,000 bushels of corn into starch.

Fruit trees were in blossom all about Athens, Ga., Feb. 5, and ripe strawberries had been picked from vines in the open air.

Mr. J. S. Hubbard, Fredonia, N. Y., sends us his Wholesale Price List of Grape Vines, Fruit Trees, &c., for the Spring of 1876.

Meadville, Pa., has been selected by the State Grange, Patrons of Husbandry, as the place for holding their next annual meeting.

Mr. J. P. Thompson, Secretary of the State Pomological Society, has become the Horticultural Editor of the Michigan Farmer.

Prof. Stockbridge of Amherst College, has obtained a patent upon his method of growing crops by the use of specific chemical fertilizers.

E. W. Stewart, late Editor of the Buffalo Live Stock Journal, becomes Associate Editor of the National Live Stock Journal, with which it has been consolidated.

In 1850 the aggregate value of butter and cheese exported from this country amounted to only $334,000. This year the export value of cheese alone will be over $12,000,000.

The exposure of the Dairy Ring connected with the Centennial, made elsewhere on this page, must be read with profound surprise and regret by the friends of the parties implicated.

The annual report of the State Assessors shows that there are 27,757,785 acres of farming lands in this State, exclusive of the lands used for farming purposes in the suburbs of cities and those in incorporated villages.

It is estimated that within a radius of two miles at La Salle, Niagara County, N. Y., there are 82,000 fruit trees growing. Of these, 37,300 are apple, 42,400 peach, 1,800 quince, 3,000 pear, and 500 crab-apple trees.

The rumor that "Prof." Arnold has succeeded Prof. Hopkins as editor of the Rural Home lacks confirmation, though, judging from recent issues, the former is liable to the suspicion of being an assistant in the department of personals.

Mr. Geo. E. Morrow, late of the Western Rural, Chicago, has received and accepted a Professorship in the Iowa Agricultural College. Mr. M. has been a journalist, and we trust will acquit himself with equal honors in the new position which he assumes.

The Agricultural Building on the Centennial grounds, now nearly completed, will prove one of the most attractive edifices in the great group. The farmers of the country may well be proud of what has been done to uphold the interests and dignity of their noble pursuit.

There are 703,325 head of cattle in Kansas, an increase of nearly 100 per cent. in five years, while the hogs have increased in the same time about 40 per cent. The total value of the farm products is placed at $43,970,444. The population of the State is 531,156. There are 74,905 dogs in the State, and they destroyed last year 5,223 sheep.

In a Rochester paper of a late date "An Old Citizen" claims for that locality the origin of the first Ring, and explains by telling how the Indians thereabouts joined in slaughtering cats and calling their scalps wolf scalps, thus receiving the bounty offered for the latter. But that was long before the Centennial, and when neither Tweed, Canal, Whisky, Dairy nor other similar Rings had been dreamt of.

BUSINESS NOTICES.

Throat Affections and Hoarseness.—All suffering from *Irritation of the Throat and Hoarseness* will be agreeably surprised at the almost immediate relief afforded by the use of "*Brown's Bronchial Troches.*"

Paint your house with the best. Every keg "**Phœnix Pure White Lead**" warranted fine, white, good body, and the most durable paint.

FORGET-ME-NOT.

I AM the flower that every age has sung,
My name has trembled on the unwilling tongue;
'Midst sad farewells how mournfully has rung
Forget-me-not!

I imagine best the heaven's eternal blue!
Though transient clouds may hide it from the view,
It shineth still, faith's never-changing hue,
Forget-me-not.

The restless brook, the river's deeper flow,
Beside my quiet home still come and go;
I kiss the waters, murmuring soft and low
Forget-me-not.

The birds above me hovering on the wing
List the hushed whisper, and the woodlands ring
With the light choral as they answering sing,
Forget-me-not.

The laughing eddies hastening to the sea
With rippling echoes mock the symphony,
The rude winds toss it on their pinions free,
Forget-me-not.

And human voices catch the sweet refrain,
In loving accents fraught with human pain,
Repeating still the never dying strain,
Forget-me-not.

The Story-Teller.

PAUL MILMORE'S STORY;

OR, THE LOST CHILD AND THE CROWS.

"IF you please sir, don't shoot those crows."

The gun dropped from my shoulder and I angrily turned toward the intruder who had so startled me as well as spoiled my shot.

"Don't shoot the crows?" replied I. "Why not, pray? They're destructive fellows; they pull up the corn and kill the young grouse, besides making such an infernal noise that one can scarcely think."

"Well sir, I'd rather you wouldn't shoot them on my farm."

The speaker was a gentleman; I saw this at a glance. He appeared to be between forty-five and fifty years of age, although his dark gray hair and beard gave a somewhat older expression to his face, which bore all the marks that some great sorrow had left, for it was furrowed deep.

Regarding him attentively for a moment, I said:

"I supposed every farmer was glad to have such troublesome neighbors made way with, especially at this time of the year, just as the young corn is beginning to send forth its shoots."

"The crows are welcome, sir, to all the corn they want on my farm. I've lived on this place more than six years, and should be very sorry to think that one had been killed during that time."

"It's a very singular fancy you seem to have—this penchant for crows; there must be some reason for it. I certainly never heard of such a thing before."

"There is a reason," said the gentleman, examining my face closely, as he paused for a moment; then, as if satisfied with the scrutiny, he resumed, "and if you care to hear it, and will walk over to the house and take a cup of tea with us, I'll tell you the story," adding apologetically, "we sometimes get lonesome out here on the prairies, and are glad to see a gentleman's face."

As the invitation had been proffered in the spirit of genuine Western hospitality, I accepted it as frankly as it had been given, and climbing over the fence that had up to this time separated us, started to accompany the farmer to the house.

The conversation had taken place in a newly-planted corn field. I had been hunting all day without success Chilled with the cold and weary and vexed at my ill luck, I was returning toward the farm house where I was stopping, when I noticed a large flock of crows busily engaged in tearing up the just sprouting corn in a field some distance from the road. Determined not to return empty handed and thinking to do the owner of the field a favor as well as to test the truth of the old axiom, that "crows can smell gunpowder," I had crept quietly up until within gun range, and was about to give the contents of both barrels of my "Jo Manton," when I was interrupted as above narrated.

A short walk brought us to the house, which proved to be a comfortable—in fact, for Western Iowa, an elegant—cottage, romantically situated upon the banks of a miniature lake. As we were walking toward it, I handed my companion my card, which he received with a bow, informing me that his name was Milmore, and that he was pleased to greet me.

As we approached the house, I could but note the neat and comfortable appearance of the buildings, as well as the good judgment that had been displayed in their location, and the admirable taste shown in the general plan of a half finished flower garden that occupied a portion of the lawn between the house and the beautiful little lake. But, if surprised by the order and neatness everywhere visible upon the outside, I was no longer so when I was presented to the presiding genius, the mistress of the establishment; for I was hardly prepared to find in a Western farm house so much refinement and exquisite taste as was displayed in the *tout ensemble* of the charming home.

The lady herself was about forty years of age; not beautiful, but interesting, a connoisseur of female beauty would have decided, with a face still fresh and fair though, like the husband's, it wore an expression that so far excited my curiosity that, at the first glance, I became painfully conscious of a desire to learn the history of this couple that had evidently so heroically relinquished the luxuries and refinements of the East for the hard and laborious duties of a frontier life. Mrs. Milmore bade me welcome to her fireside with an ease and grace that only served to confirm my first impressions of her education and culture.

After an exquisite supper, daintily served, mine host invited me into the library, remarking that I might make myself comfortable, for I must remain his guest for the night, at the same time wheeling one of the large Turkish easy chairs before the blazing hickory fire. He then produced a couple of fragrant Havanas, and lighting one I prepared myself to hear my host's singular desire to protect those ill-omened birds, the crows.

It is that story, told as nearly as I can recall it after all these years, in his own words, that I propose to relate to you.

I was born in Oneida County, New York, and was intended by my father for a lawyer; but, after delving a year in the office of an eminent practitioner of that County, I became dissatisfied, renounced the idea of acquiring a profession, and went to the City of New York, where I entered the mercantile house of Smith & Talbot—then, as now, one of the wealthiest firms in the importing line in that city. But promotion in the counting room comes slow; particularly so while one has but little capital to advance his interests.

While in the employ of this house, I met for the first time a niece of one of the members of the firm—my wife; and when, two years later, my father died and left me a small competency, I took it and entered into business for myself, and, within a year, married. From the date of our marriage, my life was a blessed one indeed; nothing seemed to disturb the even tenor of our lives, for we drifted along in the current, forgetful of all else save our own happiness and, I now fear, selfishly, heedless of the cares and troubles of others.

After five years of unalloyed happiness my wife became the mother of a beautiful boy; and it seemed as though I had nothing more to desire, no greater boon to ask for. Then came the financial crisis of '57, that caused such widespread disaster and ruin among the mercantile community, and for a time it seemed impossible that my house would be able to withstand the crash that swept like a whirlwind through the country; but I finally weathered the storm, and by good management came through it stronger than ever.

Shortly after this our child was taken sick, and it seemed for months as though we should lose him. He partially recovered, though my physician, after many mysterious hints that I can understand now, told me that if I wanted to see him grow to years of maturity, I must leave New York and find a home upon some Western farm.

I can't tell you, sir, how I dreaded to inform my wife what the physician had said; it seemed a terrible sacrifice to ask her to make; and it was only after months of hesitation that I ventured, one day, to broach the subject to her. To my great joy, she saw the necessity, and at once consented to leave New York, our friends, acquaintances, culture, ease, and luxury, for the discomforts of a pioneer life.

In closing my business in the city an opportunity occurred which enabled me to secure what was termed a fine tract of wild Western land, and to it we came. I built this house and surrounded our home with such comforts as we could procure, for here we determined to remain and rear our child, who was fast growing to be a noble boy.

When Benny was four years old, he was a child that any parent might have been proud of; and when we saw his ruddy cheeks and the perfect picture of health that he appeared, his mother and myself both felt that no sacrifice we had made for him was too great. He was the apple of our eyes, sir, the breath of our life, and had grown to be the idol of our home—our household god, to the exclusion of all things else.

Three years ago this fall, when Benny was almost five years old, one dark November day I was in the field where I had a couple of men at work, and, late in the afternoon, I chanced to look up, and saw the little fellow, accompanied by his pet rabbit, coming toward me from the house.

I went to meet him, and, taking him in my arms, told him that it was too cold for him out there, and to run back to his mother. I was busy at the time, and thought no more of the matter until just before dusk, when I returned to the house, and my wife met me at the door with the inquiry:

"Where's Benny?"

Before the question had left her lips, I felt a chill go over me like an ague fit; cold hands seemed to clutch my heart, cold lips to whisper in my ear, "Benny's dead." I turned toward my wife and saw that as she looked into my face hers grew ashy pale, while she waited for my answer. My tongue fairly cleaved to the roof of my mouth, and I could not have answered a word had my life paid the forfeit. At last she seemed to read my thoughts; for, seizing my arm with a grasp that I can feel to this day, she gave such a wail of anguish as never mortal ear listened to before, and fell to the floor insensible.

I can't tell you why I thought so, but, from the moment my wife asked for the child I had a presentment that Benny was dead. It flashed upon me like lightning, nor could I get rid of it, though it weighed me down like an incubus.

We were alone in the house at the time, and I picked her up from the floor and carried her to the room there, and laid her upon the bed. Then I summoned assistance, and went out of doors to find that it had grown bitter cold, as well as very dark. I instantly dispatched my men to rouse the neighbors and then returned to the house to endeavor to console my poor wife. As I entered the door, the sound of my steps appeared to rouse her to consciousness, for she sprang toward me, and, throwing her arms about my neck, and looking pleadingly into my face, cried:

"You will bring me back my darling boy, won't you, Paul?"

I promised her I would, and she bestowed upon me a hundred kisses, murmuring all the time:

"Thank God! he's safe then; thank God! he's safe then."

Perhaps you can imagine, in some degree, my feelings. No person ever experienced such as I did when I realized what I had promised, for I knew that the boy was dead as well as I know it now; and all the while she lay at my feet, moaning like some dumb creature in pain, and I trying to console her with assurances that I knew in my heart were false! But what else could I do?

When the neighbors came in, they carried her to her room, while I went out to search for our child. In less than an hour all the settlers within five miles were hunting, with torches and lanterns, over the prairie for the boy. As for me, where I went or what I did I have never known, for I had one thought constantly in my mind—that our boy was dead, and I had promised to bring him back to his mother alive.

Well, sir, we searched all night, notwithstanding the fact that about three o'clock the next morning the snow began to fall. I never saw it snow faster, for by daylight the ground was covered more than five inches deep, and we had not found the child. We kept up the search, and before noon more than fifty persons were engaged in it; but we found no trace of him, and at last it was reluctantly given up. Then I knew that I must return to my home alone and tell my wife the truth.

What passed after I reached the house I do not know, for the next two days are but as a hideous dream. I only remembered that my wife met me at the door and said to me, "If you had only told me the worst, I would have tried to be strong for your sake, my dear husband;" and then—well, sir, I knew nothing more for forty-eight hours. When I awoke to consciousness I rose from the bed, partially dressed myself, and went out and stood bareheaded beneath the leaden-gray November sky; and when I felt the wintry wind and saw the ground white with snow, and realized that it was the winding sheet of our darling boy, I felt that I could almost follow the advice of Job's wife, "Curse God and die."

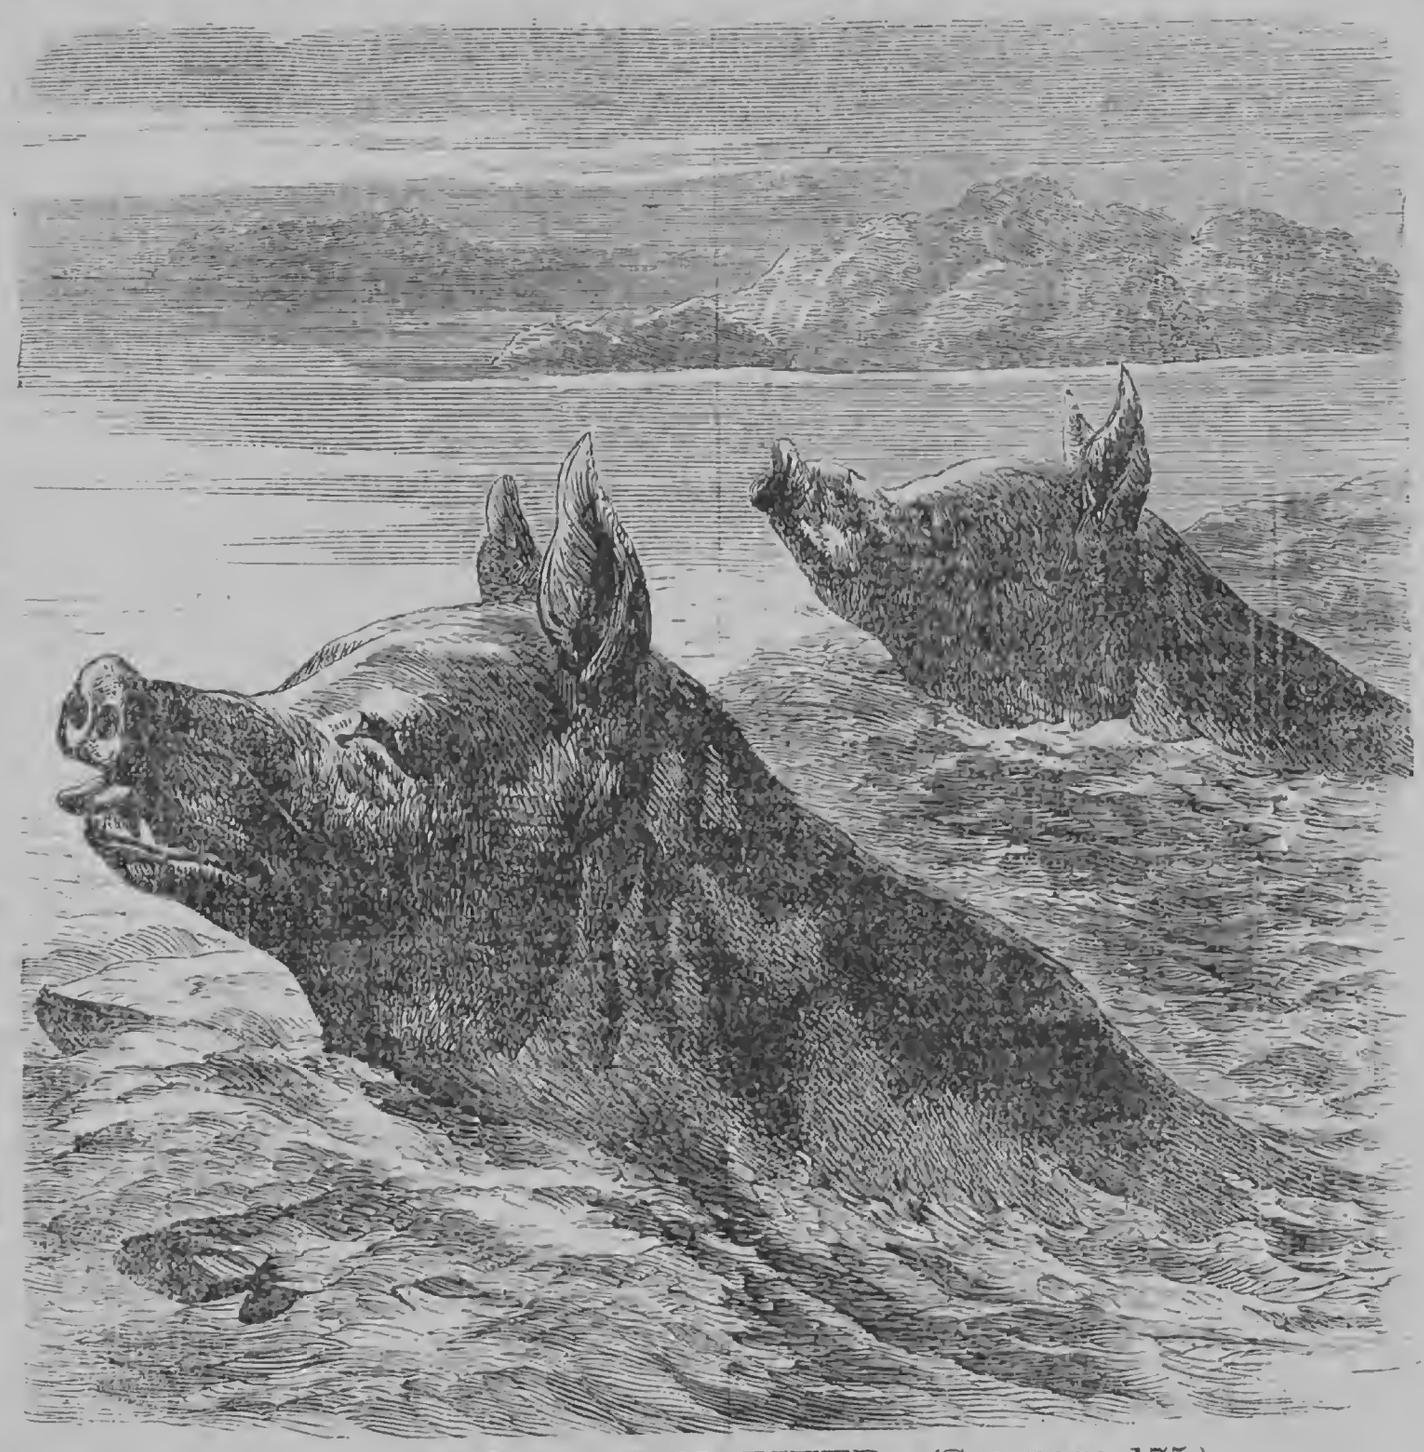
Standing in the yard I noticed that a large flock of crows had gathered in the field yonder, nearly half a mile from the house. I watched them for some time without seeming to heed them. I saw them flying swiftly athwart the heavens, jostling each other in their haste; then, when they appeared to have reached one particular spot, they would soar high in the air for an instant and swoop down, almost touching the ground, to rise once more, mounting higher and higher in a circle until, flying over my head, they would again dart back to the field, all the time uttering their harsh cries, which seemed to bid me "Search!"

So strongly did I become impressed with this idea, that I started toward the place, bareheaded and half clothed as I was, and so weak that I could hardly stand.

It was a long time before I reached the spot over which the crows were hovering; but, as I approached it I saw by the side of a dry, withered stalk, crouched as though for protection from the rude blast, a rabbit. Imagine my feelings when I recognized it as our darling boy's pet, nearly dead from hunger and cold. The instant I saw it I knew that I had found our boy—that Benny was there. I lifted the half-frozen creature carefully to one side and, kneeling, quietly removed the cold snow from the body of our darling. I remember taking him in my arms and kissing his cold lips; but how I reached the house I can't tell; I only know that I laid him in his mother's lap, and that she looked up in my face with a sweet smile and said: "I have been waiting so long for you to bring dear Benny back to me, Paul."

When I again returned to consciousness, Benny had been buried two weeks, and I was told that the physician said he had undoubtedly dropped dead from aneurism of the heart. Had it not been for those crows, sir, his little body would have lain upon the cold ground, unburied, until spring.

Now, sir, you know why I didn't want the crows shot. I don't often speak of this, our great sorrow; but I feel that an apology was due you for the unceremonious manner in which I interrupted your shot, and perhaps there was something in your face that told me that you would understand the motive that prompted me in spoiling your anticipated sport. And now, with your permission, we will return to the other room. My wife will be glad to talk with you, for it is not often that we see gentlemen from the East so far West as this.



PIGS CROSSING THE RIVER.—(See page 175.)

I thanked my host for his story, and assured him that ever after I would respect crows for his sake; nor have I killed one since.

We returned to the sitting-room and I spent a delightful evening in conversation with my charming hostess and her husband; and the next morning, after partaking of a delicious breakfast, I bade my new friends good-by, and returned to my boarding-house, quite satisfied to go back empty-handed. I have often, since that time, had the pleasure of visiting Mr. Milmore and his wife at their charming Iowa home; but the subject of crows we have never mentioned since my first introduction.

AN EDITOR OF 1775.

In 1775 there were four newspapers published in New York. Rivington's Royal Gazetteer was the subservient tool of the British authorities. The Mercury, published by Hugh Gaine, was a time-server and trimmer. Anderson's Constitutional Gazette was born and died in 1775, and had no influence whatever. The New York Journal, published by John Holt, was the sturdy and unpurchasable organ of the Sons of Liberty. Its editor fled the city after the disastrous battle on Long Island, and he was heard of afterward as publishing his newspaper at one and another of the towns on the Hudson under circumstances that would have appalled a less determined man. In the month of August, 1777, while at Esopus, he printed an advertisement in which he proposed to take any kind of produce in the way of trade. His prospectus reads very quaintly:—"And the printer, being unable to carry on his business without the necessaries of life, is obliged to affix the following prices to his work, viz., —For a quarter of news, 12 lbs. of beef, pork, veal, or mutton, or 4 lbs. of fine flour, or half a bushel of wheat, or 1 bushel of Indian corn, or half a cord of wood, or 200 wt. of hay, or other articles of country produce as he shall want them, in like proportions, or as much money as will purchase them at the time; for other articles of printing work, the prices to be in proportion to that of the newspaper. All his customers who have to spare any of the above articles of country produce, he hopes will let him know it, and afford him the necessary supplies, without which his business here must very soon be discontinued." It is gratifying to be able to state that the sturdy patriot survived the Revolution, and lived to revisit the city of which he had been Postmaster in 1775. His patriotic labors and sufferings justly entitled him to the following epitaph:—"A due tribute to the memory of John Holt, printer to this State, a native of Virginia, who patiently obeyed death's awful summons on the 30th of January, 1784, in the sixty-fourth year of his age. To say that his family lament him is needless; that his friends bewail him is useless; that all regret him, unnecessary; for that he merited every esteem is certain. The tongue of slander cannot say less, though justice might say more." Such an epitaph, inscribed over the dust of an editor, who had also held commission as Postmaster, opens a wide field of emulation to the journalists and officials of these later days.

DISRESPECT AT HOME.

One of the dangers of home-life is this habit of disrespect—that which is bred by familiarity. People who are all beauty and sunshine for a crowd of strangers for whom they have not the faintest affection, are all ugliness and gloom for their own, by whose love they live. The pleasant little prettiness of dress and personal adornment, which mark the desire to please, are put on only for the admiration of those whose admiration goes for nothing, while the house companions are treated only to the ragged gowns and threadbare coats, the tousled hair and stubby beard, which, if marking the ease and comfort of the *sans façon* of home, mark also the indifference and disrespect which do so much to damage the sweetness and delicacy of daily life. And what is true of the dress is truer still of the manners and tempers of home, in both of which we find too often that warm of respect which run side by side with affection and the custom of familiarity. It is a regrettable habit under any of its conditions, but never more so than when it invades the home and endangers still more that which is already too much endangered by other things.

Parents and up-bringers do not pay enough attention to this in the young. They allow habits of disrespect to be formed—rude, rough, insolent, impatient—and salve over the sore with the stereotyped excuse: "They mean nothing by it," which, if we look at it aright, is worse than no excuse at all, for if they really do mean nothing by it, and their disrespect is not what it seems to be, the result of strong anger, uncontrollable temper, but merely a habit, then it ought to be conquered without loss of time, being merely a manner that hurts all parties alike.

ANECDOTE OF BRET HARTE.

Bret Harte was lecturing in Pennsylvania a short time ago. At one of his appointments he felt very much depressed. It is said to be a peculiarity of humorists to be at times unaccountably gloomy and melancholy, and Bret, we believe, is no exception to the rule. He was in this mood on the occasion of which we speak. One of the lecture committee went back of the scenes to see him, and the depressed humorist welcomed him as a gleam of unusually good sunshine. They shook hands—Harte earnestly, the committeeman obsequiously.

"Mr. Harte," said the gentleman, gravely, "you will find this an exceptionally healthy city."

"Ah!" said the humorist.

"Yes, sir. The death rate is only one a day."

At this juncture Harte took the committeeman by the arm and hurriedly asked;

"Is he dead?"

"Dead!" ejaculated the committeeman, in astonishment. "Who dead?"

"Why, the man for to-day," said Harte, very gravely.

The committeeman stared with all his might at the immovable face of the lecturer, and Bret continued:

"Isn't there a clerk here, or register, or coroner, or something like that, of whom you could find out whether the man for this day has died?"

"Yes, yes, I suppose so," slowly replied the committeeman.

"Would you, then, be so good as to find out, and, if possible, before I commence the lecture, whether that man is dead? If he is, I am all right, as I am to leave the city early to-morrow morning; but if he is not, I cannot help feeling uneasy about myself, for I am not well to-night."

The obliging committeeman immediately hurried away to get the information.

When Bret was in his room at the hotel that night a servant told him a gentleman wished him to step down stairs into the hall. He went down, and there met the committeeman.

"I am extremely sorry, Mr. Harte, to disturb you at this late hour," he said, "but I could not get the desired information sooner. It is all right, however. That death rate I spoke of was merely the average."

Bret thanked the committeeman for the trouble he had taken and pleasantly bid him good night.

OUTWITTING A CONGREGATION.

Old Dr. Strong of Hartford, Ct., was not often outwilled by his people. On one occasion he had invited a young minister to preach for him, who proved rather a dull speaker, and whose sermon proved unusually long. The people became wearied, and as Dr. Strong lived near the bridge, about the time for the commencement of the afternoon service, he saw his people flocking in great numbers across the river to the other church. He readily understood that they feared they should hear the same young man in the afternoon. Gathering up his wits, which generally came at his bidding, he said to the young minister, "My brother across the river is very feeble, and I know he will take it kindly to have you preach to his people, and if you will do so, I will give you a note to him, and will be as much obliged to you as I would to have you preach for me, and I want you to preach the same sermon you preached to my people this morning."

The young minister, supposing this to be a commendation of his sermon, started off in good spirits, delivered his note, and was invited to preach, most cordially. He saw before him one-half of Dr. Strong's people, and they had to listen one hour and a-half to the same dull, humdrum sermon they had heard in the morning. They understood the joke, however, and said they would never undertake to run away from Dr. Strong again.

TELL-TALE LIPS.

I have observed that lips become more or less contracted in the course of years, in proportion as they are accustomed to express good humor and generosity, or peevishness and a contracted mind. Remark the effect which a moment of ill-temper and grudgingness lays upon the lips, and judge what may be expected from a habitual series of such movements. Remark the reverse, and make a similar judgment. The mouth is the frankest part of the face; it cannot by the least conceal its sensations. We can neither hide ill-temper with it, nor good; we may affect what we please, but affectation will not help us. In a wrong cause, it will only make our observers resent the endeavor to impose on them. The mouth is the seat of one class of emotions as the eyes are of another; or, rather it expresses the same emotions, but in greater detail, and with a more irrepressible tendency to be in motion. It is the region of smiles and dimples, and of trembling tenderness; of a sharp sorrow, or a full breathing joy, of candor, of reserve, of anxious care, of liberal sympathy. The mouth, out of its many sensibilities, may be fancied throwing up one great expression into the eye—as many lights in a city reflect a broad luster into the heavens.—*Leigh Hunt.*

A LESSON IN POLITENESS.

A friend of Dean Swift one day sent him a turbot as a present by a servant lad who had frequently been on similar errands, but had never received anything for his trouble. Having gained admission, he opened the study door, and pulling the fish on the floor, cried out rudely, "Master has sent you a turbot!" "Young man," says the Dean, rising from his easy chair, "is that the way you deliver a message? Let me teach you better manners; sit down in my chair; we will change places, and I will teach you how to behave in the future!" The boy sat down, and the Dean, going out, came up to the door, and making a low bow, said, "Sir, master presents his kind compliments, hopes you are well, and requests your acceptance of a small present." "Does he?" replied the boy; return him my best thanks, and here's half a crown for yourself!" The Dean, thus caught in his own trap, laughed heartily, and gave the boy a crown for his ready wit.

If we are sufficiently watchful over our own conduct, we shall have no time to find fault with the conduct of others.

The Literary World.

NEW PUBLICATIONS.

Bible Word-Book: A Glossary of Scripture Terms which have changed their Popular Meaning, or are no longer in General Use. By WILLIAM SWINTON, author of "Harper's Language Series," "Word-Book," "Word-Analysis," etc. Edited by Prof. T. J. CONANT, D. D. New York: Harper & Brothers.

This little manual, though designed for Bible-readers generally, is specifically intended for Sunday Schools and Bible Classes. Dr. CONANT most heartily commends it to Sunday School teachers and their classes, and to others who have not more expensive works devoted to literary discussions which have no direct bearing on the illustration of Scripture.

His Natural Life. A Novel. By MARCUS CLARKE. New York: Harper & Brothers.

The Curate in Charge. A Novel. By Mrs. OLIPHANT, author of "Chronicles of Carlingford," "For Love and Life," &c., &c. New York: Harpers.

Pausanias the Spartan. An Unfinished Historical Romance. By the late Lord LYTTON. Edited by his Son. New York: Harpers.

THESE are Nos. 458, 459 and 460 of the "Library of Select Novels" issued by Messrs. HARPER & BROTHERS in uniform style, with paper covers. They combine cheap and entertaining reading for the million.

Little Folks' Letters.—Young Hearts and Old Heads. By NANNETTE S. EMERSON, author of "A Thanksgiving Story," including "Betsey and I are Out," &c., &c. New York. G. W. Carleton & Co.

HERE is a volume of letters which will not only delight the little folks, but please the old heads as well. Taken all in all—contents, illustrations, binding, etc.,—the work is superb and most heartily commended. These Letters are so far superior to the trash given in most of the juvenile periodicals of the day that they will prove an admirable substitute for such sensational romances and mock sentiments as the aforesaid periodicals furnish.

Pausanias the Spartan.—An Unfinished Historical Romance. By the late Lord LYTTON. Edited by his Son. [12 mo.—pp. 203.] New York: Harper & Brothers.

THE admirers of Lord LYTTON will be pleased with this work, unfinished though it be, for it is characterized by his style and genius, and is of course absorbingly interesting. Had the author lived to complete it the finale of the historical romance would no doubt be most entertaining, yet as it is the volume is very readable and of special interest to all students of ancient history.

LITERARY NOTES.

GEN. FRANCIS A. WALKER has a manual of political economy in preparation.

A WORK by Mr. E. L. GODKIN of the Nation, "On Government," will be published during the year.

THE April Atlantic will contain a critical study of early American novelists by Mr. GEORGE P. LATHROP.

MR. RUSKIN has edited a work on "The Art Schools of Medieval Christendom," by A. C. Owen, just ready in England.

MR. BANCROFT'S first volume in the centenary edition of his United States history appeared on Washington's birthday.

E. J. HALE & SON will soon publish "Moody and Sankey—an Authentic Account of their Lives and Services," by Mr. FRANK S. READER.

THE third volume of LANFREY'S "History of Napoleon the First"—an English translation—is promised by Macmillan & Co. for early use.

PROF. THOROLD ROGERS will print "Epistles, Satires and Epigrams," the first two adapted from HORACE and JUVENAL, but entirely modernized.

A LITTLE book of "Hints on Bible Marking," by Mrs. STEPHEN MENZIES, with a prefatory note by Mr. MOODY, will be published by A. D. F. Randolph & Co.

A WORK on "The English Bible," by JOHN EADIE, D. D., LL. D., being a history of the various translations of the Scriptures, is soon to be published in London.

Osgood has published Hawthorne's "English Note-Book," in two thick volumes of the "Little Classic" series, and they make an excellent supplement to "Our Old Home."

GEORGE MACDONALD'S new novel, "Thomas Wingfold, Curate," to be published by George Routledge & Sons, will be directed chiefly against the religious, or irreligious views of such scientists of Prof. Tyndall.

COL. GEO. E. WARING will publish in the March Atlantic a final article on "Drainage." His valuable papers on this subject will then be put in shape for a volume to be issued by Hurd & Houghton, under the title of "Sanitary Drainage in Cities."

MR. EDWARD JENKINS, author of "Ginx's Baby," has at last begun the serial publication of his Coolie novel, entitled "Lutchmee and Dilloo," announced several years ago. Dodd & Mead long since made direct arrangements with the author for its republication here.

COL. R. I. DODGE, U. S. A., in addition to his work on the Plains, has written a volume on "The Black Hills," which will give the routes, with map, descriptions of the scenery, views, and the facts as to soil, timber, climate, gold, etc. Col. DODGE was one of the military exploring expedition.

Sabbath Reading.

"NEARER, MY GOD, TO THEE."

A LATE English paper says:—In most collections where Mrs. Adams's hymn, "Nearer, my God, to Thee," is printed, only five verses are given; but the authoress wrote six, of which the following is the last, and the one usually omitted:

"Christ alone beareth me
Where thou dost shine,
Joint heir He maketh me
Of the Divine!
In Christ my soul shall be
Nearer, my God, to Thee,
Nearer to Thee."

The above stanza was not written by Mrs. Adams. It was added in a Baptist Collection of Hymns in England, by Rev. A. T. Russell. The internal evidence is enough to show that it was not by the author of the hymn. The following, which was written by Mrs. Adams, is not to be found in the collections in use in this country:

FATHER, THY WILL BE DONE.

He sendeth sun, He sendeth shower,
Alike they're needful for the flower;
And joys and tears alike are sent
To give the soul fit nourishment.
As comes to me or cloud or sun,
Father, Thy will, not mine, be done.

Can loving children e'er reprove
With murmurs whom they trust and love?
Creator, I would ever be
A trusting, loving child to Thee;
As comes to me or cloud or sun,
Father, Thy will, not mine, be done.

Oh, ne'er will I at life repine,
Enough that Thou hast made it mine;
When falls the shadow cold of death,
I yet will sing, with parting breath,
As comes to me or shade or sun,
Father, Thy will, not mine, be done.

LET YOUR PREACHER KNOW IT.

A MINISTER, worn out and sick, and therefore unable to prepare as he wished for his work, entered the pulpit with a faltering step and faltering heart. The sermon was delivered in weakness of body and misgiving of heart, and the services closed.

As the tired and discouraged pastor walked down the aisle, a lady, well up in years, waited till he reached her, then, taking his hand, she said: "Mr.——, I thank you, under God, for that sermon—it helped me greatly; it was just what my soul needed." And that pastor went out of the church, not puffed up with pride, but elated in heart and thankful to God, encouraged and strengthened, and "blue Monday" was not "blue" at all, but bright; while the work of the week was lighter far for the memory of the words in the aisle.

It might injure your minister if you told him often that his sermon was eloquent, his points well made, or his style striking and beautiful; but don't be afraid to tell him sometimes when the words are blessed to the comfort of your soul. That will make him a better preacher, a happier man, and a humbler Christian. Many a heavy heart has been carried by tired limbs in a weary manner out of the pulpit, down the aisles, up the street and into the study, when a word or two from one who had been blessed would have made it light and joyous. Many a time during the week's labors have the wheels of your pastor's mind seemed rusted and hard to move, when the memory of words which perhaps you might have spoken of the good his Sabbath's discourse had done you, would have been oil, causing a smooth and easy motion. Pastors do not ask for praises, but they do need encouragement, and to a man who is giving the labors of his life for the good of souls, it is certainly encouraging to know that his work is not in vain. If the Lord blesses your preacher's words to your good, let him know it sometimes.—*Rocky Mountain (Col.) Presbyterian.*

THOUGHTS AND SUGGESTIONS.

If any one speak ill of thee, flee home to thy own conscience and examine thy heart; if thou be guilty, it is a just correction; if not guilty, it is a fair instruction; make use of both; so shalt thou dist'l honey out of gall, and out of an open enemy create a secret friend.

The soul that does good to others grows in goodness. He that is a medium of blessing to others is himself blessed thereby. Hence selfishness is folly as well as sin; for while it prevents our doing good to others, in the same degree it prevents our doing good to ourself.

The greatest man is he who chooses the right with invincible resolution; who resists the sorest temptations from within and without; who bears the heaviest burden cheerfully.

They that deny a God destroy man's nobility, for certainly man is kin to the beast by his body; and if he is not kin to God by his spirit he is a base and ignoble creature.

The highs of earthly promotion lift us no whit nearer heaven. It is easier to step there from the lowly vale of humiliation and sorrow.

To all men, and at all times, the best friend is virtue; and the best companions are high endeavors and honorable sentiments.

Blessed be the hand that prepares a pleasure for a child, for there is no saying when and where it may bloom forth.

There is a transcendent power in example. We reform others unconsciously when we walk uprightly.

Some mourn more the shame which sin brings than the sin which brings the shame.

Ladies' Portfolio.

LOVE AT SEA.

We are in love's land to-day,
Where shall we go?
Love, shall we start or stay,
Or sail or row?
There's many a wind and way,
And never a May but May;
We are in love's land to-day,
Where shall we go?

Our land-wind is the breath
Of sorrows kissed to death,
And joys that were;
Our ballast is a rose;
Our way lies where God knows,
And love knows where.

Our seamen are fledged loves,
Our masts are bills of doves,
Our decks fine gold;
Our ropes are dead maids' hair,
Our stores are love-shafts fair
And manifold.

Where shall we land you, sweet?
On fields of strange men's feet,
Or fields near home?
Or where the fire-flowers blow,
Or where the flowers of snow,
Or flowers of foam?

Land me, she says, where love
Shows but one shaft, one dove,
One heart, one hand.
A shore like that, my dear,
Lies where no man will steer,
No maiden land.

MAPLE BUDS.

No. II.—Help Him, Parents.

BY MAY MAPLE.

"LET me have the paper! You make such blundering work with your reading that it is about as intelligible as the duck's quack. I don't see what's the good of your schoolin' if the teacher can't make a better reader of you."

So said Mr. BROWN to his oldest son, BENNY, who had taken up the newspaper, looked over the humorous items, and finding one particularly pleasing to himself, had undertaken to read it aloud for the entertainment of the family. But he *was* a sad blunderer, and quite spoiled the sense of the item. His father had no patience with him, and seldom tried to correct his faulty articulation in a proper manner, preferring to do the reading himself.

The boy handed the paper to his father with downcast eye, and a very uncomfortable swelling in his throat. He did wish he could read well. He didn't see why there need be so many long, hard words. Mr. BROWN read the "funnygraphs;" but BENNY did not care for them now, although the rest of the family seemed to be greatly amused. And we heard the boy muttering, as he picked up his hat and started for the barn, that it would be a long time before he would read anything for his father again.

"And this," we thought, "solves the mystery of so many poor readers in a land where an education is free to all." Those parents who *can* read prefer to do it themselves, rather than listen to one less intelligent. They never seem to think that the duller their children are about learning to read in school, the more necessary it is that they should have extra practice at home. And to improve they must read in the presence of one who is capable of correcting their faults—that *one should be endowed with patience*, and he should also keep on hand a good supply of that fragrant blossom known as Good Nature. A child should seldom if ever be ridiculed for his faults. For who does not shrink from the keen edge of sarcasm?

Again, parents should be more willing to supply their children with pleasant home-reading suitable to their growing minds. Yet there are but very few who feel willing to subscribe for a child's paper, though they may take a half dozen to suit their own tastes. But thanks to the publishers, who, as a class, seem to have a good deal of sympathy for the child-nature, there is a department for the young readers in almost all the weekly papers.

Now, if Mr. BROWN does not like to pay out his money for a *child's* paper, let him just write his son's name instead of his own when he is about to subscribe for the RURAL NEW-YORKER. Thus the boy will have a paper he can call his very own, and still it will be one that Mr. BROWN can appreciate also. Do you think BENNY will be displeased to have a valuable paper come to the village post-office addressed to himself? Behold, he treads like a veritable monarch, when he enters the house with *his own* mail matter in his hand. He will be no happier when he receives his first love-letter. With what a dignified air he takes off the wrapper which has his name *printed* upon it, and unfolds its pages. Of course the wood cuts will all be examined first, for who ever saw a boy that was not fond of pictures? Then the "Wit and Humor" column will be scanned. After a while the story will be found.

Now, if the mother will just express a desire to have her son read it to her, slowly and carefully, he will most gladly comply. Very gently she will criticise his worst blunders, and, lest she wears out his patience with too much fault finding, she will silently excuse the more trivial errors. When he finishes, she will *express* her thanks for the pleasure he has given her in reading the story aloud. It will not be long before he will be sure to find something else in that splendid paper that will be sure to please mother; and, with bright eyes and a smile of great satisfaction, he will ask if he shall not read this "piece" to her. Every week there will be a renewed interest, and very strange it will be if BENNY does not improve in his reading and general intelligence, for he will read all there is in the paper because it is his *very own*. And in the years to come, when BENNY becomes a man and takes the lead in literary circles, on account of his ability to read well, will those parents be sorry that they gave the boy a few years' subscription for papers that pleased him to read, or took a little pains to correct his faulty pronunciation? Will their time and patience have been vainly spent in attending to that part of his education?

Too much is left to the teacher. It is utterly impossible for him to give to each pupil more than a few minutes of time for each lesson. Think of the classes the district teacher is required to superintend personally each day. Besides the demonstrations and explanatory lectures,—a word here, a line there, a problem for this one, analysis for the other. In nine cases out of ten, there will be some lesson to be excused, and quite likely it will be the reading that will be considered of the least importance to the average number of the class. The dull scholar then stands a poor chance of making progress in this branch of education. Then on you, oh parents, must devolve, at least, a part of the responsibility of making your sons and daughters good readers. The painstaking, careworn mother should oblige her daughter to read aloud some of the pleasant stories that she spends hours in reading to herself. It ought to be a pleasure to each member of the family to read aloud while the rest are otherwise employed. If this was customary, we would not find so many poor, unintelligent readers.

A GLIMPSE AT THE RURAL.

WE had been to Central Park, that memorable Saturday afternoon of our stay in New York, and admired its wide paths and carriage ways—its wonderful bridges and grand lawns, which must in summer time be very beautiful. I could hardly imagine a Park of 843 acres—it seemed to me like half a dozen good farms; but it is a blessing I can well understand to have such a glimpse of *out-doors* in the midst of such a Babel. Here was a rustic summer house where an old lady and gentleman had seated themselves to rest; there a spring of water issuing from a rock; yonder a wide, serpentine carriage drive, where vehicles of every description can be seen; and just beside one, a shady path where two can hardly pass. Then we went to the Menagerie and admired the wonders gathered therein—saw the lions, tigers and elephants, that look so unhappy in their iron cages, and pitied while we feared.

But our chief interest centered in the Museum, and after we had examined the cases where are collected the order *Quadrumana*, we stood a long while in admiration before the bright-plumaged birds of tropical countries, and looked at the *Crocodilia* without fear. The *Artiozoa* next claimed our attention, and we had quite a little practical lesson on the strange and beautiful things that are found in the sea, if properly understood. Then our Entomological proclivity asserted itself and we commented on the *Hemiptera* and *Orthoptera*, and mentally compared the bright-winged *Lepidoptera* with our own small collection at home in far-off Canada.

Thoroughly tired at last, we left the wonderful Park and taking a Fifth Avenue stage made our way towards our resting place for the night. On, through Broadway, when suddenly MAYSIE jumped up excitedly, "There's the RURAL!" It was only a flash as we passed by Duane St., and the occupants of that stage-no doubt thought they had no need to go outside of it for a "*rural*,"—but we heeded not and smiled at each other, for we knew what we meant. ANNIE L. JACK.

ONE OF THE SORROWS OF LIFE.

MANY a volume has been written about the love of parents, the love of mothers, its enthusiasm of hope and fancy, its adornations of the unworthy, its agony for the lost; but we do not remember that any one has ventured to touch on a still more terrible view of the subject—the disappointment, for example, with which a woman full of high aspirations, noble generosities and, perhaps, an unwarrantable personal pride, all intensified by the homely circumstances of life around her, sometimes looks upon the absolutely commonplace people whom she has brought into the world. She too, has had her dreams about them while they were children, and all things seemed possible—while they were youths, with still some grace and freshness of the morning veiling their unheroic outlines. But a woman of 70 can cherish no fond delusions about her middle-aged sons and daughters, who are, to all intents and purposes, as old as she is. What a dismal sense of failure must come into such a woman's heart while she looks at them! Perhaps this is one reason why grandfathers and grandmothers throw themselves so eagerly into the new generation, by means of which human nature can go on deceiving itself. Heavens! what a difference between the ordinary man or woman of 50 and the ideal creature which he or she appeared to the eyes of 15! The old people gaze and gaze to see our old features in us; and who can express the blank of that disappointment, the cruel mortification of those old hopes, which never find expression in any words?

THEY who are very indulgent to themselves seldom have much consideration for others.

Reading for the Young.

BABY'S DRESS.

BABY, baby, bless her;
How shall mamma dress her?

The summer cloud
Is not too proud
To find soft wool to dress her.

The blue bell
Is a true bell,
And will find the blue to dress her.

The cherry tree
Is a merry tree,
And will find the pink to dress her.

The lily bright
Will find the white,
The beautiful white to dress her.

The leaves in the wood
Are sweet and good,
And will find the green to dress her.

The honey suckle,
With buds for a buckle,
Will make a girdle to dress her.

The heavens hold
Both silver and gold
In the stars, and they will dress her.

[*Good Words for the Young.*

AN INDIAN FUNERAL.

A STORY FOR THE LITTLE FOLKS.

BY NANNETTE S. EMERSON.

THEY were a merry party of cousins gathered in the old New England homestead. I do not know their ages exactly, but I guess MABEL was eight years old. She had always lived near her father's old home, and JOSIE was nine, but she had been with her parents in Texas for several years. HOWARD must have been about ten, and FRED, JOSIE'S brother, was eleven.

There had been a picnic in the pine-woods the day before, and all the school and village children had been romping and swinging and playing games all day long. I will let you listen some day when I tell my little folks about this famous picnic from which the children came home late in the summer evening, tired out with the long, happy day. They slept late the next morning and dreamed of fairies, perhaps, who dance in the moonbeams until the sun shining through the green leaves drives them away. And though they woke happy and refreshed, they did not feel so much like startling everybody with unexpected mischief as they generally did. So, when they had eaten breakfast, the whole party went out to the long open shed, to play with the little dogs and plan for the future.

They soon fell to talking about the picnic and then JOSIE said:—"We went to a kind of a picnic in Texas once—do you remember FRED?"

FRED—"A picnic?—no!—I am sure we never went to a picnic there. What are you thinking of?"

JOSIE—Don't you remember? It was over the mountains. Some Indians sent for the squaws who were working at the ranche and father took us over."

FRED—"That was a funeral, goose. Big Quill Quecheta," the oldest chief was dead, and some Mexicans had brought a lot of fireworks to help celebrate his journey to the upper hunting-ground, and light him on his way to the big hunt, where buffalo with horns of solid gold and hides covered with snowy white fleece roamed in great herds. You never saw a queerer sight, I reckon, than those solemn old copper-skins, wrinkling their leathery brown faces to smile with pleasure when the rockets shot up into the air, leaving a slender ladder of stars on which their dead companion could climb toward Heaven, they thought."

HOWARD—"By hokey, I'd like that."

MABEL—"And could you see them JOSIE?"

JOSIE—"Yes! It was splendid—the strange red and blue lights shining against the dark mountains."

FRED—"But were you in a house, do, so you could not see the best fun. Some of the rockets had fallen into the water when the mule that carried them was crossing a ford, and these the Mexicans had left aside, knowing they would not go off. Some little Indian children, boys and girls together, (they are as spry as monkeys and just about as sensible,) found these wet rockets, and so they lighted a fire and undertook to dry them. They tried again and again to light them, but the fuse would not burn, so at last they threw them all on to the fire together. They went off then, you bet! One bounced out and hit an old brave on the back of his head and brought him to his feet with a howl; then two or three scattered themselves among the pappooses, and the pappooses scattered themselves in all directions, yelling like wild-cats. A young Mexican picked one up that he thought the fire had not touched, and just then it went zurr-rr-rr, and the young black eyes jumped about a rod and sat down on a cactus; that did not seem to make him happy, so he hopped up and capered around indiscriminately.

"Meanwhile some half dozen rockets and bombs had started off on their own responsibility. The worst trick about them was, that you never could tell what they would do next. If I saw one travelling away, straight and swift, the first I knew it was sure to bounce back again and hit a fellow just where he was not expecting it. At last two or three of the burning things scooted out among the mules, where they were tied and watched by the young ones, and all at once the air was full of mules' heels and little Indians, and bursted bits of paper, and I thought it was just a good time to get out of reach. So I dodged through a shower of burning sparks and Mexican cuss words and tumbled into the house."

JOSIE—"Oh, Fred! how you do talk."

HOWARD—"Ha! ha! ha! Wouldn't I like to have been there then. But you say it was a funeral. Where was the coffin and the remains of old leather face. Did they happen to be in the way of the wandering fireworks?"

FRED—"Oh, no. They do not go in for the luxury of coffins in that country. They just wrap the departed redskin in his best blanket and lay him up among the branches of the nearest tree, out of the reach of wolves and bears, and on the tree they hang his hatchet and hunting knife. Then they go away and leave him, and I do not know what becomes of the bones."

MABEL—"What a strange way to have a funeral. But did you stay there on the mountain all night?"

JOSIE—"No. I remember the ride home, with the great stars seeming to shine warmer and warmer as we went down into the valley. And Mamma and old Aunt JOYS were waiting for us by the door of our home. But I wish you would tell me about Thanksgiving, MABEL. Oh, there comes Uncle JOHN, with JOHNNIE and HORTENSIA! Now we will have fun"—and away they all scampered.

A STORY ABOUT TWO PIGS.

[SEE ILLUSTRATION, PAGE 173.]

WE are apt to class pigs among the least intelligent of all our animals, and it is certain that they are particularly awkward and troublesome travelers; but a curious circumstance which happened in our own neighborhood nearly thirty years ago, seems to prove that, if left to themselves, pigs can be as clever as we know dogs and horses and several other creatures have often shown themselves, in finding their way home under more or less difficulty.

A gentleman, residing at Elmira bought two pigs at the market which were conveyed to his home. They were afterwards observed trotting along the Southport road to Elmira. The result was their safe return to the place from whence they had been conveyed to Elmira, a distance of five miles, and by cross-roads. The farmer from whom they had been purchased brought them back to their owner, but they took the first opportunity to escape again, re-cross the water, and never stopped till they found themselves at their first home. How the matter was afterward settled we cannot say; but the affair was thought so remarkable, especially by some neighbors, who took great interest in the study of animals and their capacities, that it excited full and particular inquiry and investigation at the time, and the truth of the above facts may therefore be relied upon.

The Puzzler.

FARMER'S ENIGMA.—No. 1.

I AM composed of 53 letters:
My 22, 7, 2 is a kind of grain.
My 9, 5, 48, 29, 25 is a useful animal.
My 11, 31, 13, 3 is a farm implement.
My 35, 21, 10, 30, 11 is a domestic animal.
My 1, 16, 17, 23, 39 is a building.
My 20, 23, 28, 47, 8, 4, 7 is a kind of grass.
My 32, 12, 41, 34, 12 is made of wheat.
My 6, 17, 36, 39, 37, 50 is made of milk.
My 26, 38, 24, 11 is something bees need.
My 19, 46, 8, 33, 17, 44, 50, 53 is an agricultural editor.
My 10, 27, 19, 2 is a part of an animal.
My 14, 51, 18, 15, 5, 15 is a kind of tree.
My 43, 52 are consonants.
My whole was said by a wise man.

DOUBLE CROSS-WORD ENIGMA No. 1.—Rhine and Rhone.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

DISGRACE OF SEC'Y BELKNAP.

THE Congressional Committee on Expenditures of the War Department, which usually considers its duties of the slightest public importance, has this year set to work most earnestly. The result is an astounding record of corruption in a quarter where least expected. Mr. Belknap, the Secretary of War, has been found guilty of selling the post tradership at Fort Sill, for which $20,000 was paid, part on receiving the position and the remainder in annual payments of $6,000 per year made to the Secretary's wife, with whom the arrangement was made and through whose influence the position was obtained. The effect of these disclosures was most astonishing. Sec'y Belknap broke down completely, confessed his shame, and only asked, but in vain, that his wife should be spared the mortification of having the facts made public. As soon as he knew that the Committee had the evidence in its possession, Sec'y Belknap went to the President and tendered his resignation, which was promptly accepted. Mr. Clymer, Sec'y of the Committee, read its report to the House March 2d, and in conclusion moved that Sec'y Belknap be impeached which, after faint opposition, was unanimously voted. The Investigating Committee was constituted a Committee to prepare formal articles of impeachment and present them before the Senate for trial. Some question arises whether the acceptance of the resignation will forestall impeachment, but the general and probably well founded belief is that it cannot. Impeachment involves not only removal from office, but disqualification for holding any position of honor or trust under the United States Government. This after penalty of his crime the Secretary has yet to receive.

During his residence in Washington Sec'y Belknap and family have lived in a style far more expensive than was warranted by his salary—$8,000 a year. Love of display and extravagance shared both by the Secretary and his wife is undoubtedly largely responsible for his fall. Let us hope that the disgrace it involves will teach a lesson widely needed and which cannot be too closely heeded.

DESTRUCTIVE TORNADO IN THE WEST.

THE deranged weather which has prevailed for more than a year past occasionally breaks out in freaks of unusual tempestual violence, causing floods and tornadoes. Two of these latter are reported from the West, both occurring on Feb. 27. The first is located in and near Princeton, Ind., twenty-eight miles north of Evansville. The storm lasted only a few minutes, but in that time destroyed property whose value is estimated at from $100,000 to $150,000. Numerous farms, with their buildings, throught the county, have also been destroyed, so that the whole loss in the county will probably reach a quarter million dollars. The following persons were injured:—Mrs. Wm. Clark, seriously; James S. Taylor, internally; Mrs. R. Torner, one eye lost; Miss Kendle, limb broken; Susan Blanchard, hip bone hurt. In some places the houses were carried 100 yards from their foundations. In one instance a horse was discovered in a cellar, whither the tornado had carried him from a stable fifty yards away. James Leslie, an old man, who is a full cousin of ex-President Jackson, was in his bed in the second story of his large brick residence, when the wind struck the house and tore out the ends, carrying him, together with his bed, out into the road, without injuring him in the least. The vacant lots in the town, in some places, are covered with lath and shingles, which were forced into the ground to the depth of four or five inches. Immense quantities of hail fell, ranging in size from a walnut to a hen's egg. The destruction of property, for the most part, has fallen upon those who are ill able to bear it. To add to the terror which prevailed, two houses which were blown down took fire and were consumed.

St. Charles, Mo., was visited by a most terrible tornado. Rain began to fall, followed by hail. In a moment dark yellow streaks were observed following in the course of the clouds. A noise as loud as thunder was then heard, and in the twinkling of an eye the tornado burst. The heavens were shut out by the *debris* of wrecked buildings, which filled the air so that nothing could be discerned. The roar of the wind was appalling and every one paralyzed by fear. The duration of the tornado could not have been longer than one-half of a minute. Three persons were killed, so far as known. James Gosney and his little son were both found dead in the gas-house, the child clasped in his father's arms. Both bodies were crushed and badly mutilated. It is also reported that a child was blown over the bridge, which is 90 feet high, but its body has not been found. About 20 persons were injured. The damage to property is estimated all the way from $100,000 to $150,000.

EXTRAVAGANCE AND GREED.

THE lesson of the day is a terrible one. An officer of the Cabinet and a trusted adviser of the President confesses his corruption in using his position to sell offices within his gift. He has been impeached by Congress and will, without doubt, be disqualified from holding office, besides suffering probably fine and imprisonment for his offenses. To these crimes Secretary BELKNAP and his wife were undoubtedly led by their desire to live more showily and spend money more freely than was warranted by the $8,000 a year which a Cabinet officer receives for his services. It is the fashion among some journals to decry this salary as too small, and this has been urged as partial palliation for the Secretary's crime. It is said that a Cabinet officer cannot live "respectably" on his salary. This is simply absurd. The RURAL NEW-YORKER goes to thousands of homes where half of $8,000 a year would be considered affluence. The trouble is that it is not "respectability" which these devotees of fashion are seeking, but each is blindly striving to outdo others. Expensive dinners are given, some of which cost $1,000 to $5,000 each. Houses are hired, suited only to an extravagantly expensive establishment and of course at corresponding prices. A few men with immense private incomes "set the fashion" in the race of extravagance, and Congressmen, Senators and other officials with no income but their salaries, consider themselves compelled to emulate these examples,—too often followed by bankruptcy or as in the case of Sec'y BELKNAP, by some act which forever blackens one name and disgraces our country in the eyes of foreign nations.

It is high time that all this should change. It is not a party question; but one of personal economy and honesty. We cannot have a cure of dishonesty in administration while the personal habits of law-makers and those who set the fashion in Washington are all in favor of unlimited extravagance. Economy in personal expenditures must go hand-in-hand with economy in Public administration of the Government.

It is a curious and sad commentary on this unhappy case, that while Secretary Belknap and his wife were leading the fashion in Washington the money by which their lavish outlay was supported was wrung from United States soldiers in distant trading posts, receiving $13 a month or $156 per year, and who because of the Secretary's crime were compelled to pay the extortionate profit of five hundred per cent. on everything they bought. And yet the Secretary was not able to live as he thought himself entitled to on his legal salary of eight thousand dollars a year. There need be no pity wasted on the guilty Secretary or his equally guilty wife for punishment which follows a crime of such disgusting meanness.

HOME NEWS PARAGRAPHS.

THE Advisory Council called by Plymouth Church to consider its action in the Beecher case, and in dropping Mrs. Moulton from membership, has adjourned. The final conclusion of this Council is to present twenty names of the most eminent members of the Congregational Body in America from which Prof. Timothy Dwight of New Haven, Rev. J. N. Wellman of Malden, Mass., and Hon. Bradford R. Wood of Albany, are to select a commission of five. This commission is to make a thorough examination of all charges against Mr. Beecher and Plymouth Church. The Council decides that Plymouth Church has not contravened the usages of the denomination in any action it has heretofore taken, and in their concluding speeches Dr. Bacon, President Porter of Yale and President Sturtevant, expressed the deepest regard and affection for Mr. Beecher and the Church of which he is pastor. The commission to make the investigation is not yet decided upon; but among the twenty names proposed it is certain that five can be chosen in whose ultimate decision the public may repose entire confidence.

The stonecutters of Chicago have petitioned the City Council to exclude prison labor from competition on the new Court House work. The reply is that the work must go to the lowest responsible bidder, without regard to creed, color, sex, or condition of service.

J. B. Phillips of Orwell, Ohio, is making a cheese which will not be completed until the 20th of May, when it is expected to weigh 22,000 pounds. It is, perhaps, needless to say that it is hoped to astonish the natives as well as the foreigners at the Centennial.

Thirty-three mines in Colorado have been opened to a depth of from 100 to 900 feet since 1859. Five of them were idle last year, but the rest produced ore valued at nearly $2,000,000. Since their discovery they have yielded $26,980,000.

There is an ancient maiden lady of 82, living in Taunton, Mass., who has never seen a train of cars, dresses in Continental fashion, burns tallow dips, and has not called upon her neighbors for five years. If she does not make the most of the present year and its peculiar privileges, there is fear that she will die an old maid.

Montana, too, has its diamond excitement, owing to the discovery of some stones at Pioneer, which, having been sent to England to be cut, are pronounced by a lapidary to be genuine diamonds. One of the stones weighs four pennyweights, and, although a little off color, cuts glass freely, and stands all the ordinary tests of diamonds.

The Grand Lodge of the Knights of Pythias held a special session at Philadelphia on Mar. 2d when Chancellor's rank was conferred.

In Charleston Mass., Spencer Decker, age 12, was held in $5,000 bail, charged with causing the death of Charles H. Pressy, a playmate, 9 years of age.

Warsaw N. Y., goes for temperance by 76 majority.

On the afternoon of March 4, a freight train on Baltimore and Ohio Railroad, while crossing the bridge at Delaware, broke in two, throwing a car into the river.

The wife of Representative Wheeler of New York died in Washington Mar. 4.

Thomas J. Judge, one of the Justices of the Supreme Court of Alabama, died on the 4th inst.

The Republicans of Rochester have nominated Cornelius R. Parsons for Mayor, and the Democrats have nominated James Brackett.

Ross Campbell, aged 57 years, a prominent dry goods merchant of Baltimore, died last week of erysipelas. Mr. Campbell was also extensively engaged in business in New York.

Since the middle of November last a Somerset, Mass., man trapped in that town, 830 polecats, 160 muskrats, 20 minks, and 2 raccoons, and sold their skins for $567.

The City Council at Stockton, Cal., is considering the policy of establishing separate schools for truant and ill-behaved boys who cannot be controlled by the usual discipline.

The Industrial Works at Springfield, Vt., run on the co-operative plan, are a great success. The number of employes has been largely increased, and work is progressing day and night.

The New Hampshire temperance revival is assumming vast proportions. Twelve thousand persons have signed the pledge since the movement began.

Another west bound night freight train on the Troy and Greenfield road, consisting of twenty-five cars and two locomotives, was partly wrecked Mar. 2, by a car running off the track just west of Bardwell's Ferry station. The brakeman being unable to stop the train it ran on to the bridge across Deerfield river, dumping five cars into the river, fifty feet or more below, and damaging the bridge so that the train from the tunnel into Boston did not reach here until 11 A. M., and then only by shoving the cars across the bridge, it not being deemed safe for a locomotive. No one was injured.

A hunting party in Granby, Vt., recently slaughed 14 deer, the crust being such that the men could go along on it easily, while the deer cut through. Two arrests have been made, this sort of sport being unlawful.

FOREIGN NOTES.

A NEW mode of abandonment has been developed in France by the unnatural parents of a little boy four years old, who left him at the Vincennes station with an unsigned letter, stating they could not support him. The police have as yet been foiled in their attempts to discover the parents, the child being unable to give the necessary information.

A Latin inscription recording the triumph of the Emperor Claudius over the Britons and the taking of Caractacus has been found engraved on a stone in the wall of the ancient Cyzicus, in Asia Minor, and a copy has been presented to the Paris Academie des Inscriptions.

An ascent of Mont Blanc was successfully effected on the 20th of January by M. Gabriel Lappe, a French painter, and Mr. James Eales, whom the papers call an English geologist. The curious feature of the exploit was that at an elevation of 13,000 feet they found a temperature higher than that which prevailed in the lower regions.

Prince Bismarck rode on horseback in the Thiergarten, Berlin, on Mar. 1st, the first time for fully a year. He looks well, and it is now said that he is in satisfactory health.

Negotiations are pending for the marriage of the Duke of Genoa with the Archduchess Marie Christine, daughter of the Archduke Charles Ferdinand of Austria.

At the Dublin Lord Mayor's banquet the Lord Lieutenant of Ireland said the country had been more prosperous last year than ever before. Emigration and pauperism had sensibly decreased, two prominent banks were paying a dividend of twelve per cent., and the deposits in the Bank of Ireland amounted to £1,000,000 sterling more in 1875 than in the preceding year.

There is a curiosity of literature in England called the "Wordless Book." It does not contain a word, but the colors of its leaves supposed to interpret the thought. Two black leaves symbolize the unregenerate heart of man; red, the blessed redemption; white, the purity of the soul, washed in the blood of redemption; and gold, the radiant joys of heavenly felicity.

Santo Domingo continues greatly disturbed by the Presidential campaign. The three candidates—Gonzalez, Luperon, and Baez—have each ardent partisans who are easily provoked to arms. President Gonzalez, who is seeking re-election, appears to have the best claim to popular support.

It is fortunate for Don Carlos that he recently inherited $5,000,000 from his father-in-law, the dethroned Duke of Modena. This large sum will enable the adventurer to settle with his British adherents, to whom he owes about $1,000,000. He can hardly compensate them, however, for the awkward position into which he has led them by his empty boastings.

Despite the unfriendly course of Austria and Russia the insurgents in Herzegovina let pass no opportunity of showing their contempt for the terms of peace offered by the Sultan at the instance of the Great Powers. The battle at Dabra, recently, in which 800 Turks were slain, will embitter the conflict still more, and render a peaceful settlement almost impossible.

The city authorities of Brighton, the fashionable English watering place, are considering a proposition to build a number of cottages to be rented from Saturdays to Mondays during the season.

Mr. Alexander Agassiz has been elected in his father's place to the Zoological Society of London, and the Imperial Society of Natural History of Moscow. These are the three principal zoological and natural history societies of Europe, and in each of them the number of foreign honorary members is limited.

Signor Cuneo, a very old friend of Garibaldi and his companion in South America, having lately died without receiving extreme unction, the Roman Catholic Church refuses Christian burial, and the corpse is still above ground in Florence. Garibaldi has written a letter advising the burning of the body, which system he desires to be applied to his own remains, and he offers to receive Cuneo's ashes at Caprera in his family vault.

Some curious and startling facts concerning the people who live upon the canals are given in a recent English publication, entitled "Our Canal Population." It appears that on the canals and rivers in England there are not less than 22,400 men, as many women, and 72,000 children; and that 20,000 of these men and women are living as husbands and wives in an unmarried state, and have 40,000 illegitimate children. Mr. Smith says of these boatmen and their families:—"Ninety-five per cent. cannot read and write, ninety per cent. are drunkards, sixty per cent. are unmarried, but living as husbands and wives. Many of the boaters and their families have but one home, little more than one bed, and one suit of clothes, and these not much better than rags. The cabin home is scarcely the size of an ash-box, but in this hole men and women live together, children are born, and families are educated into vice and crime."

A despatch from Rome to the London Standard says that Cardinal Ledochowski was expected to arrive there last night.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 4, 1876

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	63,235	Molasses	1,868
Whisky	2,638	Rice, bbls	1,855
Corn meal, bbls	1,895	Cut meats, pkgs	16,414
Corn meal, bags	5,059	Lard, pkgs	8,811
Wheat, bush	139,300	Tobacco, hhds	1,559
Corn, bush	312,196	do. cases	2,700
Oats, bush	189,414	Butter, pkgs	18,457
Rye, bush	6,050	Cheese, bxs	15,518
Malt, bush	54,981	Cotton, bales	22,600
Barley, bush	44,600	Rosin	454
Beans, bbls	13,592	Spts. turp., bbls	146
Grass seed, bags	9,308	Dried Fruits, pkgs	175
Beef, pkgs	3,617	Eggs, bbls	12,557
Wool, bales	911	Peanuts, bags	502
Hops, bales	1,747	Dressed Hogs	2,251
Pork, bbls	3,981	Leather, sides	82,570
Tallow	1,106		

BEANS AND PEAS.—Exports of beans past week, 451 bbls.; since Jan. 1st, 9,666 do.; same time last year, 3,670 do. Exports of peas past week, 9,322 bush.; since Jan. 1st, 122,440 do.; same time last year, 92,818 do. Heavy receipts of beans continue oppressively large, and with no compensating demand for any grade the market is dull and prices are weak. In marrows the market shows a marked falling off compared with the past few weeks. Buyers of mediums seem pretty well stocked. Kidneys are very quiet, the Southern, their usual outlet, being very limited this season. Southern B. E. peas have declined.

We quote beans, pea, new, prime, $1.35@1.40; other, $1.15@1.25; medium, new, prime, $1.25@1.30; good, $1.10@1.15; very poor, 50@90c.; marrow, new, prime, $1.70@—; other, $1.40@1.55; white kidney, prime, $1.70@1.75; fair to good, $1.50@1.60; red kidney, new, prime, $1.40@1.45; fair to good, $1.20@1.30; California Lima, choice, $2.40@2.50. Peas, Canadian, bbls., new duty paid, $1.15@1.18; bulk, in bond, 85@95c.; green new, ⅞ bush., $1.60@1.65; Southern B. E., ⅞ bush. bag, $2.85@2.90.

BEESWAX.—Exports past week, 3,298 lbs.; since Jan. 1st, 24,600 do.; same time last year, 23,353 do. Choice lots are in small stock and bring rather better prices. Western quoted at 32@32½c., and Southern at 33@33½c.

BROOM CORN.—Medium stock is in fair supply and favoring the buyer; choice lots still wanted.

We quote Brush, short green, 9@10c.; hurl, green, 8½@10c.; green, medium, 5@7c.; red and red-tipped, 3@4c.

BUTTER.—The past few days have developed the fact that the remainder of the crop of State will soon be settled here and that fact alone helps to revive what was becoming a drooping market. Fine butter continues scarce and is likely to go out high. Under grades are steady and not likely to advance materially. Several back seasons have made dealers cautious about putting on all the force the prices will bear in a Spring market. Western butter is in good demand and the outside rates are more frequently quoted than before. The following comparative tables are from the Producer's Price current:

	Receipts, pkgs.	Exports, pkgs.
June 1, '75, to March 1, '76	903,478	30,225
June 1, '74, to March 1, '75	790,236	41,596
June 1, '73, to March 1, '74	809,776	28,036
June 1, '73, to March 1, '73	594,214	41,461
June 1, '71, to March 1, '72	577,852	61,321
June 1, '70, to March 1, '71	437,683	14,100

State dairies entire, extra, 32@34c.; entire, good to prime, 29@32c.; fair to good, 26@29c.; firkins, selected fresh, 32@34c.; good to prime, 28@32c.; fair to good, 24@28c.; half-firkin tubs, selected, 37@40c.; good to prime, 33@35c.; fair to good, 29@32c.; poor to fair, 18@27c.; State, Welsh, tubs, full made, 28@32c.; dairies, 25@30c.; good to prime, 21@23c.; fair to good 24@26c.; poor to fair, 18@21c.; Pennsylvania, store packed, 18@26c.; Western, dairy tubs, selected, 27@28c.; good to prime, 24@26c.; tubs selected fresh, 27@28c.; good to prime, fresh, 24@26c.; fair to good, fresh, 20@23c.; poor to fair, fresh, 17@19c.; Western, early packed, selected, 22@24c.; Western, early packed, other, 16@17c. Roll butter, good to prime, 25@26c.; fair to good, 23@25c.

CHEESE.—The market begins to show a little more life. There is an advance abroad which has brought freer orders from shippers and sales effected at 13½@14c. for ordinary to strictly fancy factories. The home trade is moderately active. Exports past week, 21,171 boxes; cable quotation, 62s. for Liverpool, gold. New State factory, fancy, 13½@14c.; fine, 13@13½c.; do. good to prime, 11½@12½c.; fair to good, 10@11½c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12½c.; good to prime, 10½@11½c.; fair to good, 9½@10½c. Western factory, cheddar, due, 12@12½c.; good to prime, 11@12c.; flat fine, 12½@13c.; good to prime, 11@12c.; fair, 8@10c.; poor to fair, 6@8c.; pineapple, 16@18c. English dairy, Connecticut, 12@13½c., do. State, 15@18c.

From the Producers' Price Current we take the following:

	Receipts, pkgs.	Exports, lb.
June 1, '75, to March 1, '76	2,240,540	86,025,058
June 1, '74, to March 1, '75	1,830,795	84,523,068
June 1, '73, to March 1, '74	1,880,489	83,962,005
June 1, '72, to March 1, '73	1,628,200	69,475,721
June 1, '71, to March 1, '72	1,380,871	61,578,607
June 1, '70, to March 1, '71	1,110,200	57,619,039

COTTON.—The Liverpool market has been steadily declining, with the rates there now the lowest since 1857; the market here has consequently been completely upset, reacting towards the close under a disposition to operate freely by a few parties. The closing prices are for March, 12 21-32c.; April, 12 29-32c.; May, 13 3-16@13 7-32c.; June, 13 15-32@13⅜c.; July, 13 11-16@13 23-32c.; August, 13⅝@13 27-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9 1-16	9 1-16	9 1-16	9 1-16
Strict ordinary	9 15-16	9 15-16	9 15-16	9 15-16
Good ordinary	10 9-16	10 9-16	10 11-16	10 11-16
Strict good do	11 5-16	11 5-16	11 7-16	11 7-16
Low middling	11 13-16	11 15-16	12 1-16	12 1-16
Strict low middling	12 5-16	12 7-16	12 9-16	12 9-16
Middling	12⅝	12⅝	12 13-16	12 13-16

Fair	14⅝	14⅝	15	15

Stained.

Good ordinary	⅛ 9 3-16	Low middling	10 13-16
Strict ordinary	10 5-16	Middling	11 11-16

DOMESTIC DRIED FRUITS.—Apples have had rather more attention and at steady prices for prime lots of quarters. Peeled peaches are in few hands and firmly held; unpeeled are in light stock but dull. Blackberries are lower and sparingly dealt in.

Apples—State, sliced, 10@10½c.; quarters, 9@9½c.; Western quarters, 8½c.; Southern sliced, 1875 crop, 10@10½c. for prime. Tennessee qrs., 8½@8¾c. Blackberries, new, 11@—c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12@12½c. for halves, and 10@11c. for quarters. Plums, 20c. Raspberries, 27c. Cherries, 21@22c. Peaches peeled, new process, 20@23c.; do. unpeeled, 12@13c.

EGGS.—The market is quiet and prices not well supported. Lent ought to give more impetus to sales, but usually buyers take stock pretty freely in anticipation of the first week or so of Lent when prices suit, and this has been the case to a large extent this season. Receipts are large. Compared with this date last year, we have received 55,000 bbls. eggs since Jan. 1st, against 28,000 same time last year. We quote:

Jersey, single barrels, ₱ bbl., 21c.; State & Penn., 19½@20c.; Western, prime, 19c.; fair marks, 18@18½c.; Southern and South Western, 17@18½c.

ESSENTIAL OILS.—Unchanged. We quote: "H. G." oil peppermint, $4, in glass; Hull & Parshall do., $4@4.20 do.; pure in tin, $3.50; sassafras, 55c.; wintergreen, $3.12; spearmint, $3.50; pennyroyal, $4.

FEATHERS.—Prime Western live geese quoted at 58@60c.; mixed, 30@45c.

FLOUR.—The market abroad has been dull and weak, and with the light trade here in consequence, lower and irregular prices prevail.

Superfine State, $4.00@4.50; extra do., $4.85@5.60; superfine Western, $4.00@4.50; extra do., $4.85@5.75; No. 2, $3.25@3.65; extra round-hoop Ohio, $4.90@5.25; trade brands do., $5.30@7.25; white wheat extras, $5.80@7.00; St. Louis, $5.25@9.00; City Mills extra, $5.00@6.50; Southern at $4.25@4.65 for superfine; $4.80@6.25 for poor to choice shipping extras; $6.30@8.75 for trade and family brands. Corn meal—Western yellow, $2.70@3.25; do. white, $2.70@3.25; Jersey & Penn., $2.90@3.25. Buckwheat selling at 60@65c. for prime State, and flour at $1.85@2.25.

FRESH FRUITS.—Exports of apples past week 180 bbls.; since Jan. 1st, 3,884 do.; same time last year, 8,966 do. Apples begin to move well and the high prices for extras are readily paid. Late arrivals have been of good quality, and quotations for them have exceeded stored parcels. We quote selected varieties as follows: Greenings, prime, $3.25@3.75; Swaars, Gilliflower, Spy, $3.25@3.50. Russets are not yet offered to the trade; they would probably bring rates for good mixed lots. Florida oranges, in cases, are in good demand at $5@7.50 each. During the week the winter market was enlivened by an arrival of 100 quarts of strawberries from Mandarin, Fla. They arrived in elegant condition in two of the Allagretti Antiseptic refrigerators. They were raised by Mr. Sayres, and sold here at $4@5 per quart by Arendgeon & Co. Cranberries are almost out of stock. Peanuts are a little stronger, they are apt to improve in the spring. Hickory nuts nominal at $1.25.

Apples.—Spitzenbergs and Baldwins, fine, $4@4.50; Greenings, —@— mixed, good, $2.50@2.75; other $1.50@2. Cranberries—Jersey, choice, bush. crates, full measure, $4.25@4.50; good to prime, $4@4.25; made bbls., $12.50@13.50. Nuts—Peanuts, Virginia, 1.45@1.60, do. Wilmington, $1.30@1.50; do. Tennessee, 95@$1.10. Pecans, 12@13c.

FURS AND SKINS.—We quote prime skins:

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50
Cat, Wild, North and East States, cased	50 to 60
Cat, Wild, Southern and Western	40 to 50
Fisher, Northern and Eastern	7 00 to 12 00
Fisher, Southern and Western	3 00 to 8 00
Fox, silver	15 00 to 50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00 to 5 00
Fox, Red, Northern and Eastern, according to size and color	1 50 to 1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25 to 1 50
Fox, Red, Southern and Western	75 to 1 00
Fox, Gray, North and Eastern, cased	75 to 1 00
Fox, Gray, South and West	40 to 60
Fox, Kitt	30 to 50
Lynx	1 00 to 2 00
Marten, States	1 50 to 2 00
Mink, New York and New England	3 00 to 4 00
Mink, Can., Mich., and Minn	2 00 to 3 00
Mink, New Jersey, Pennsylvania, and Ohio	1 00 to 1 50
Mink, Maryland, Virginia, Kentucky, Indiana, Wisconsin and Iowa	75 to 1 25
Missouri and all Southern	50 to 75
Muskrat, N. and East'n, fall & winter	25 to 27
Muskrat, West, including Peno, and Ohio, winter	22 to 25
Muskrat, Southern prime winter and fall	12 to 20
Otter, North'n and Eastern and Northwest	10 00 to 12 00
Otter, Penn., N. J., Ohio and Western	6 00 to 10 00
Otter, South Carolina and Georgia	2 00 to 6 00
Opossum, North, cased	18 to 20
Opossum, South and open North	12 to 15

GINSENG.—Lower. Western $110@115; Southern, $120@125.

GRAIN.—Wheat has been depressed and dull through a decline at the West and abroad, though it was more firmly held at the close. Latest sales at $1.09@1.10 for choice No. 3 spring in store; $1.40 for very choice old amber Western in store; also at $1.08@1.10 for No. 3 Chicago spring; $1.12 for No. 3 Milwaukee afloat; $1.25 for No. 2 Milwaukee in store; $1.26@1.27 for No. 2 spring; $1.32@1.47 for winter red and amber; $1.35@1.50 for white, and $1.32@1.36 for No. 1 spring. Rye at 80@85c. for State, and 78@82½c. for Western. Barley is dull at $1.07½@1.14 for No. 2 Canada, and $1.30@1.50 for No. 1 Canada. Barley malt at $1.12½@1.45 for Canada, as to quality, 85c.@$1.05 for two-rowed State, and $1.10@1.25 for four-rowed do. Corn has been in good export demand. Latest sales are 62@63½c. for mixed Western, new yellow Western at 63c.; new yellow Jersey, 62@63c. Oats have been in liberal supply and easy in price, No. 2 Chicago at 45c.; mixed Western, 45@47½c.; white Western at 47@55c.

HAY AND STRAW.—Receipts have been small, demand fair and prices strong.

Bale hay is quoted:—Shipping, 75@80c.; retail qualities, 95c.@1.10; clover, 65@70c.; salt, 65@75c. Straw is quoted at $1.05@1.15 for long rye; 80@85c. for short rye; 75@80c. for oat.

Exports past week, 171 bales; since Jan. 1st, 5,479 bales; same time last year, 6,071.

HIGHWINES.—Selling at $1.10.

HONEY.—Quiet at 18@22c. for white clover, 10@12c. for dark comb and strained.

HOPS.—Exports for the week have been 1,700 bales; these heavy shipments have led to an advance of fully one cent per lb., and the market at the close is very strong. Some few parcels are changing hands among dealers here with expected further free requirements from abroad. The supplies of strictly choice stock have become much reduced. The receipts the past week have been 1,600 bales, but they have been largely of other than best grades; home trade demand is fair.

New York State, 13@18c.; Eastern, 11@18c.; Wisconsins, 11@16c.; Yearlings, 8@10c.; Olds, all growths, 1@8c.; Californias, 17@20c.

MAPLE SUGAR.—We shall have an early offering. Samples have been received from Vermont and Ohio. It is always more or less difficult to start sugar into use at the beginning of the season. Buyers are afraid of being deceived into paying high prices for re-run old. New Ohio is quoted at 15@17c. for fine 13@14c. for other. Old is offering at 8@13c.

POULTRY AND GAME.—The dressed poultry trade is of but little moment now. Retail shops take but what is required to fill orders, and even the hotel trade is not using heavily. Large capons are selling at 28@30c. by the case, and small and slips at 24@26c. We quote:

Chickens, Bucks Co., good to prime, 17@18c.; Jersey, good to prime, 15@17c.; State, good to prime, 14@16c.; Western, good to prime, 13@15c.; fair to good, 11@12c.; poor, 9@10c. Turkeys, Jersey, good to prime, 17@18c.; State, good to prime, 16@17c.; Western, good to prime, 15@16c.; inferior, 12@13c. Ducks, Jersey, good to prime, 20@22c.; State, good to prime, 18@20c.; Western, good to prime, 17@19c.; fair to good, 15@16c.; poor, 13@14c. Geese, Jersey, prime, 12@14c.; State, good to prime, 12@13c.; Western, good to prime, 11@12c.; do., poor to fair, 9@11c.

Live poultry sells well, but the receipts keep prices easy. Ducks and geese seldom exceed the inside range. We quote:

Turkeys, Jersey, ₱ lb., 14@15c.; do. Western, 12@14c.; Geese, Jersey, ₱ pair, $2.50@3; do. Western, $1.50@1.75; ducks, Western, ₱ lb., 65@75c.; ducks, Jersey, ₱ pair, $1@1.25; fowls and chickens, State and Jersey, ₱ lb., 14@15c.; do. Western, 12@14c.; roosters, 8@10c.

Wild pigeons are wanted, now that small game birds are out of the way. We quote:

Wild pigeons, feathered, per doz., $2@2.50. Canvas back ducks, Western, ₱ pair, $1.25@1.50; Havre de Grace do., $1.75; Western, 87c., Redhead, $1; Mallard, 70c.; Teal, 40@50c. ₱ pair, Hares, ₱ pair, 20@30c. Rabbits, ₱ pair, 35@40c.

PROVISIONS—Are generally higher under increased demand, and in consideration of the small arrivals of hogs at the West mess pork is quoted $23.12½ for spot lots; $23 for March; $23.05 for April, $23.35 for May, $23.35 for June; dressed hogs at 10¾@10¾c. for Western; Western tierced pickled hams at 13@13½c.; bacon at 12¾c. for long clear, 12¾c. for short clear. Lard at 13-65c. for spot and March, 13-77½c. for April, 13-92½c. for May, 14c. for June, and 14-28c. for July. Stearine, 14½c. for choice. Tallow at 9¼c. for prime. Beef hams at $25@26. Beef—New extra mess at $13@13.50; do. plain mess, $12; new tierced at $23 for prime mess, and $25 for India mess. City extra India mess, $32@32.50. Old extra mess, $11.50; 10.50 for plain mess; packet, $15.50@16.

SALT.—Ashton's, $2.50; Deakins, Marshall's, Washington and Worthington's, $1.45@1.50.

SEED.—Clover is higher under liberal requirements of exporters; State quoted at 14½@14¾c. for strictly prime; Western at 14¾c., and Canadian at 14½c.

TOBACCO.—The arrivals have been quite liberal of Western leaf, but largely of undesirable stock, which has led to low prices to move them. Seedleaf has a fairly active export trade, and brings full unchanged prices.

KENTUCKY LEAF.—OLD CROP.

	Light. Cents.	Heavy. Cents.

VEGETABLES.—Exports of potatoes past week, 1,627 bbls.; since Jan. 1st, 13,673 do.; same time last year, 23,312 do. Exports of onions past week, 66 bbls.; since Jan. 1st, 3,451 do; same time last year, 1,718 do. Potatoes are very dull, and with the advanced season dealers have marked prices lower than their recent cheap figures. Florida green peas have sold at $5 ₱ bush. We shall have an early supply of Bermuda produce, but prices will be apt to run below the usual high opening rates. A late arrival of 800 bbls. Bermuda potatoes is putting out at $6@7 ₱ bbl. Tomatoes, 2.50@3 ₱ 5-quart box. We quote:

Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.25@1.37; Prince Alberts, $1.00@—; common, 60@75c. Sweet potatoes, $2.50@3.00. Cabbages, ₱ 100, $3@5; red, $6@10. Squash, Marrow, bbl., 75c.@$1; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@3.00. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00. Baltimore spinach, ₱ bbl., $2.25@2.50. Kale, 75@87c.

WOOL—There has been a moderate margin only. Fine Western fleeces, on account of small stock, are held firmly. California grades offered at weak prices.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., March 4, 1876.

THERE is nothing of importance doing in cheese this week at this market. Those holding fancy goods of September and October make are still asking 14c., which is above the views of buyers. The market is firm, but with a little more tendency on the part of holders to let goods go. Late ends of factories may be quoted at 11@12c. and extra grades at 13@13½c. Farm dairies range at 8@10c., according to quality for small lots of early winter make.

Winter butter sells at 23@26c. A small quantity of new milk butter now begins to come forward and may be quoted at 28@29c.

We have advices from Europe to the middle of January. Our London correspondent says:

English cheese is unaltered and not so much doing in them. There is a good demand for all qualities of American, with a tendency upward. The prices are as follows:

American extra, 65@66s.; fine, 62@64s.; good, 50@60s.; common, 30@46s. English cheddar brings 80@96s.; Wiltshire double, 62@68s.; Cheshire medium, 46@ An active market and more doing in American cheese, especially for very fine sorts, which are in small compass. Medium and low grades wanted if in good condition. Fine English cheese is very scarce. 64s fine, 75@81s.; Scotch, 50@78s., and Edams at 70@ ₱ cwt.

Fine butter is very scarce. Intermediate Continental, sound Irish, Canadian and the substitutes for butter sell well. The quotations are:

Jersey sells for 136s.; Dorsets, 160@170s.; Danish and Swedish, 100@170s.; Normandy extra, 160s.; American and Canadian, 92@120s. ₱ cwt.

Oleomargarine or artificial butter brings 70@130s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, March 4, 1876.

" last week	9,139	47	339	17,100	22,218

BEEVES.—The near approach of Lent caused a sudden decline to the markets. On last Monday trade was slow at ½c. reduction on our last closing quotations. Prices were 9@13¾c. ₱ lb.; weights, 6@11½ cwt. Wednesday trade dull at 9@12¾c.; weights, 6¼@9¾ cwt., strong. Thursday, sales slow at 8½@12¾c.; weights, 5¾@8¾ cwt. Friday, the markets closed weak at 9@12c.; weights, 6@8¾ cwt. From 55@58 lbs., net, has been allowed to the cwt. The quality of the herds as above quoted ranged from coarse to choice, being generally fat and in good order. Spanish cattle, corn-fed, sold at 9¾@9¾c.; Texan oxen, 8¼c.; State, 8½@9½c. Native steers sold at 8@12¾c.; grades do., 12¾@13¾c. Dry cows, 3@10c. Steers and heifers, mixed, 10c. Mixed herds 9@12c. Bulls, on live weight, 4@4¼c.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13½	12 @13½
Fair	11 @11¾	11 @11¾
Poor	10 @10½	10 @10½
Poorest	8 @ 9¾	8 @ 9¾
Gen. selling rates	10 @11	10 @11

MILCH COWS.—With a slight improvement in the quality of the animals on sale, prices advanced and trade became easier. Twelve cows sold at $55@80 ₱ head; 9 at $60@75; 6 at $100@75; 3 at $65; 2 at $110—calves always included.

VEALS AND CALVES.—Trade in smooth quality veals fair 8¾@11c. ₱ lb.; grass calves moderately in demand at $10@14 ₱ head. State calves, $10@12; Jersey, $12@11; State veals, 8¾@11c. ₱ lb.; Pennsylvania, 10@10½c.; Jersey, 10¾@11c.

SHEEP AND LAMBS.—The cause that has influenced the trade in beeves has also depressed trade in sheep. The flocks to hand ranged from common to good, with some choice quality sheep among them. Monday sheep sold at 5¾@7¼c. ₱ lb. Wednesday, sheep, 6¾@7¾c.; lambs, 8@8¾c. Thursday, trade dull; sheep at 5¾@8¼c. Friday, the markets closed weak at 5¾@7¾c. Missouri sheep sold at 6¾@7¾c.; Illinois, 6¾@7¾c.; Michigan, 6¾@7¾c.; Ohio, 5¾@7¾c.; State, 5¾@8¾c.; State lambs, 8@8¾c.

HOGS.—Trade in live hogs so small as not to influence the market. City dressed opened on Monday with a downward tendency, and closed at 10¾@10¾c. ₱ lb., since which date trade has been inactive at 10¾@10½c. General sales not quoted.

HORSE MARKET.—City trade fair in fair quality roadsters, with moderate trotting action; 32 head of such like horses sold at $275@475 ₱ head; there is a brisk demand for sound trotters which has not been met in the city stables. Stylish carriage horses generally held on sale; 1 pair fair quality choice sold for exportation at $1,300; 11 head coarse quality heavy draft horses, $195@250 ₱ head; 2 pairs choice quality do., $500@600 ₱ pair; 7 saddle horses, quality fair, $250@300 ₱ head; 1 pony, $75; 1 pair do., $275; 19 head of poor quality light harness horses sold at $52@100 ₱ head; 10 ordinary do., $100@215 ₱ head. Fifteen horses arrived ₱ Erie Railroad, via Oak Cliff Station.

WILLARD'S PRACTICAL Butter Book
ONLY COSTS $1,
And should be in the hands of every Farmer's wife in this country. It is full of practical and scientific information upon every branch of butter making, from the care of cows to butter in the market, and should be kept for constant reference in every house where that article is made.

☞ *This book is fully and handsomely Illustrated.*

Every one can understand it, and improve the quality and quantity of their butter by reference to its pages. Written by one who has not only made a life study of the subject, but who is himself a

Practical Dairyman,

It cannot but be thorough and useful. No book contains more solid information upon the subject in so few words. A complete index enables the reader to refer to any branch of butter making, and take in the whole subject in a very short time.

Lay it beside your churn, and apply its useful lessons each day, and your one dollar book will have yielded you fifty dollars before the end of the year.

Sent, post-paid, upon receipt of $1.

NEWS CONDENSER.

— Spinach is a Persian plant.

— Horseradish is a native of England.

— Wisconsin has voted $10,000 to the Centennial.

— The Greeks called butter boutnros—"cow cheese."

— Watertown's Union Temperance League is increasing.

— Fines at the N. Y. Tombs during February yielded $576.

— There remains $776,939.15 in the Brooklyn City Treasury.

— The first water works in Texas are being established at Austin.

— Galveston has a Venetian floating boarding house and beer garden.

— Out of 52,165 primary school teachers in Prussia, only 3,881 are women.

— A hundred pounds of flour cost twenty-eight dollars in the Black Hills.

— Women are now employed almost exclusively in the Italian telegraph offices.

— Eight hundred Turks were slain in a battle at Dabra in Herzegovina, March 1.

— Within the past three weeks 76,000 young trout have been put into Lake George.

— California exported 538,200 tons of coal last year, which brought from $8 to $11 per ton.

— Contributions to the Lee Memorial Fund in Richmond, Va., amount to $5,517 at present.

— Binghamton has a Business Telegraph Company which will soon begin locating its lines.

— Portland, Oregon, has shipped directly to Liverpool in one cargo 90,000 bushels of wheat.

— The Museum of Bremen, funded by a private society of merchants, is to be presented to the city.

— A negro woman in Opelika, Ala., has given birth to triplets, two of whom are black and one white.

— Sacramento is so well pleased with her Holly Water Works that she proposes selling out her steam fire engines.

— Letters to the number of 37,700 and 78 bags of papers were carried March 2 by the steamships Suevia and Vera Cruz.

— The property of the Wadsworth library at Geneseo, N. Y., an institution free to the whole county, is valued at $45,632.97.

— A seam of fine hard coal, nine feet four inches in thickness, has been struck at a depth of 500 feet at Nanaimo, British Columbia.

— In Antwerp two priests have been fined for having celebrated a marriage which had not been preceded by the civil ceremony.

— A passenger coach, valued at $10,000, and owned by the Canada Southern railway, was burned at Buffalo, N. Y., Feb. 27.

— A single vessel of the Georges fleet brought into Gloucester, Mass., 60,000 pounds of halibut, the result of three days' hand-line fishing.

— The number of passengers that embarked from the three principal ports of Germany during the year 1875 was 56,259, as against 75,502 in 1874, and 134,191 in 1873.

— The Redpath Sugar Refining Company at Montreal has discharged all its hands, having been forced to suspend business. The refinery employed 300 hands.

— The report on the new Capitol at Albany, says that by the additional expenditure of $4,400,000, the building may be put in such a state as to be occupied in 1878.

— Another football player has been killed in England, and it is hoped the rules, so often proving fatal, under which this game is carried on will now be modified.

— Lemons were used by the Romans to keep moths from their garments, and in the time of Pliny they were considered an excellent poison. They are natives of Asia.

— The North German Lloyd has established a new German steamship line line between Bremen and Brazil and the La Plata States. The first vessel left Bremen March 1st.

— The Central Committee of the German Societies of Brooklyn, have resolved to support Mayor Schroeder's recommendations regarding the study of German in the public schools.

— The Theological Seminary building at Rochester, narrowly escaped destruction by fire, Feb. 27. The flames were extinguished, however, before serious damage was inflicted.

— The snow is so deep on the northern division of the New York Midland that a snow plow has been used almost daily for the last three weeks. The snow reaches the car windows.

— The Rhode Island Republican State Convention for the nomination of candidates for the State offices and the election of delegates to the National Convention is called for March 23.

— A monster with a head measuring 6 feet by 4 and a body 45 feet in length has been seen by some Scotch fishermen, who recognized it as the "herring hog," a creature that they had seen before.

— The number of paupers in the metropolitan district of London on the last day of the fourth week of January, 1876, was 89,149, of whom 37,405 were in workhouses and 51,744 received out-door relief.

— One-quarter of the employes in the shops of the Delaware & Hudson Canal Company, on Green Island, are to be discharged. Wages are to be reduced ten per cent., and hours of labor increased from eight to ten.

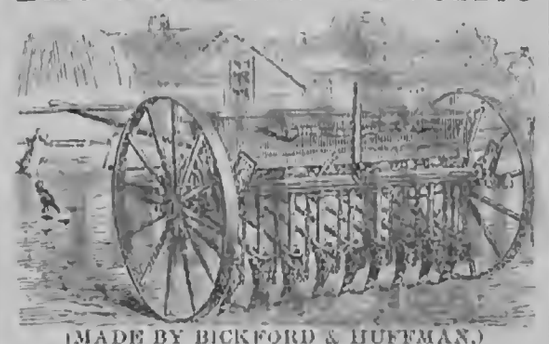
The Farmers' Favorite



(MADE BY BICKFORD & HUFFMAN,)

CENTENNIAL DRILL.

This Drill is an advance on anything we have ever before presented to the public. It is absolutely

PERFECTION.

Sows every variety of field grain, plants corn, distributes manure or broadcasts grass seeds. The attachments are entirely independent of each other, but so perfectly under control that they are thrown in or out of gear by a single lever. Its construction is light and substantial, and in short it is unapproached by any Grain Drill heretofore known. ☞ Send for Circulars to

S. N. GALLUP, General Agent, Macedon, N. Y.

YOU WANT IT.

THE

RANDALL PULVERISING HARROW!

JUST THE IMPLEMENT

FOR

Pulverizing your clay lumps;
Fitting your sod ground;
Working your summer fallow;
Fitting your fall-plowed land;
Exterminating noxious weeds;
Covering your grain of all kinds;
Mixing top manure with the soil.

IT WILL

Increase the yield of your crops,
Increase the value of your land,
Increase the money in your pocket,
Increase your general prosperity, and

SAVE YOU

One-fourth your time in fitting your soil;
All your seed by covering it completely;
Miles of wearisome walk after the old drag;
One-half the work in after cultivation and hand work with the hoe, and

TWICE ITS COST IN ONE SEASON.

☞ Send for Circulars to

Wit and Humor.

SPARKS AND SPLINTERS.

BECAUSE you have the colic don't fancy there is an earthquake.

NERVE, courage, push and patience are the qualities now needed in the business world.

IT is said that figures won't lie; but the figures of some women are very deceptive, to say the least.

A MAN with a small hed iz like a pin without enny, very apt to git into things beyond his depth.

THERE are only two hundred and sixteen men in Connecticut who have not invented some kind of salve or liniment.

"COLD streaks playing tag down my back," is the way a little Ypsilanti (Mich.) girl describes the approach of an ague chill.

Two Portland negro boys sat their uncle on a hot stove to cure him of rheumatism. The treatment may cure, if it doesn't kill.

A MILWAUKEE lady who paid fifty dollars to have a wart removed from her nose, now wants to know what has become of the nose.

A MAN never looks so helpless and insignificant as when standing around in a dry goods store waiting for his wife to get through trading.

A FOND father thought he had found the rock of ages, after swinging the cradle two mortal hours and finding his infant hopeful still wide awake.

A MAN may occasionally kiss the wrong woman by mistake. But when he makes a practice of it the right woman finds it out, and that's what bothers him.

"WHAZZER mazzer me?" indignantly inquired the fellow sitting on the curbstone, blinking at the officer as if the light hurt his eyes. "Whazzer mazzer me? Juzzer same ole thing—hyp-dermic 'jection whizzky."

"WAS the 'crowd tnmultuous?" inquired one man of another who had just come from a mass meeting. "Too multuous?" replied the other; "oh, no; just about multous enough to comfortably fill the hall."

INVITING REPAST! TURTLE OR DOG?

$ 300 A YEAR

is being made by hundreds of Local Agents for our **House Paints and Roofing Materials.** Territory *free*, profits *large!* The goods are *strictly* reliable, *ready* for use, low price, and extremely durable, as proved by 23 years' *practical* tests. Complete materials for new roofs only 4½c. a sq. ft.; can be applied to steep or *flat* roofs by any one with *positive* satisfaction.

Beautiful *Paints* for houses, floors, fences, woodwork, metal, brick or plaster, *any shade*, *ready* for use, at *low* prices. "GENERAL FAVORITE"
No. 2,
Recently perfected and offered to the trade by the
WEED SEWING MACHINE COMPANY,
Possess many advantages, both in construction and capacity, over machines now in use by
MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

TREES

We call attention to our immense Stock (700 acres) of **Fruit Trees**, Standard and Dwarf.
Small Fruits, Grapes, Currants, Raspberries, &c.
Ornamental Trees & Shrubs, deciduous & evergreen.
Roses a specialty—all the finest sorts.
Green & Hothouse Plants, incl'g best novelties.
Small parcels forwarded by mail when desired.
Prompt attention given to all orders and inquiries.
Descriptive and Illustrated priced Catalogues sent prepaid on receipt of stamps, as follows:
No. 1—Fruits, new ed. (col'd plate) 15c, without 10c.
No. 2—Ornamental Trees, col'd plate of Roses, 25c.
No. 3—Greenhouse, Free. No. 4—Wholesale, Free.
No. 5—List of New Roses for 1876, Free. Address

CIRCULAR.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

Quaker City Tile Mill.

Some of the Advantages obtained by Purchasing this MILL in preference to others, are:

It runs lighter.
It makes tile faster.
Is the simplest.
Is the most durable, and arranged so that the wear can be taken up in either mud-box or bearings of shaft.
This Mill is sold on a WARRANTY against all breaks for ONE OR TWO YEARS. Has brass boxing and polished dies for all sizes of tile. Brick dies when required.

Rural Architecture.

PLAN OF A GOTHIC COTTAGE.

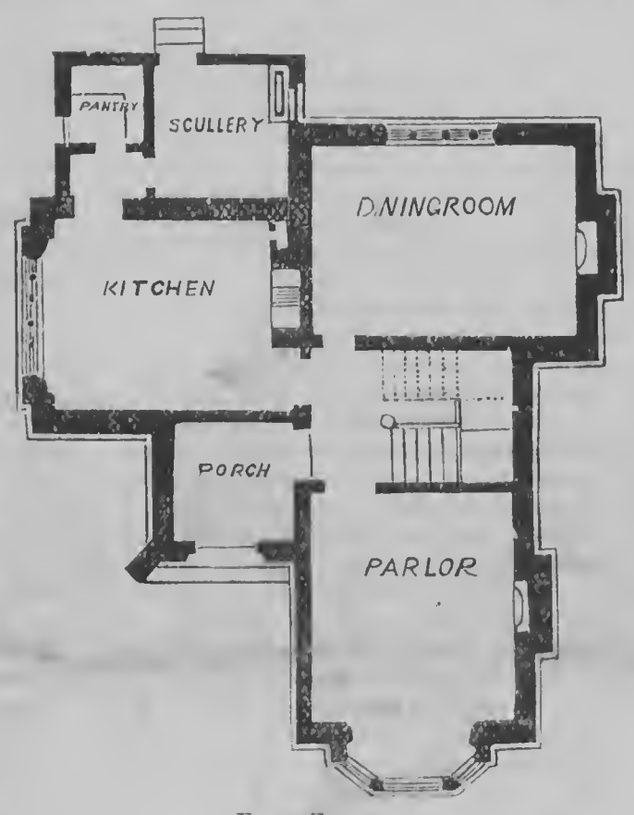
In commencing the publication of a series of designs for Cottages, &c., to continue through the Centennial Year, (see RURAL of Jan. 22,) we expressed the intention of giving such a variety of plans that many country and suburban residents would find something consonant with their location, taste and means. In accordance with that promise we this week present illustrations of front and side elevations and floor plans of a GOTHIC COTTAGE—a design somewhat unique, and one which, if not entirely adapted to the wants or tastes of those in quest of a cottage in this style, will at least prove suggestive.

It is intended that this cottage shall be constructed of brick, with stone corners. The roof is of slate and the chimney tops of terra cotta ware, which can be obtained of any desirable pattern or size. The plans exhibit accommodations for a family of four or five, there being three chambers of ample size on the upper floor. The first floor contains the parlor, dining-room and kitchen, with the pantry and scullery attached. The hall is lighted by the window opposite the landing in the second story. There is a fire-place in each apartment. Throughout the base of the building there is a cellar, having stairs beneath the main stairway. We think it a very neat design, and if built upon a large lot, slightly elevated and tastefully ornamented with walks, flowers and shrubbery, would make a home at once desirable and attractive.

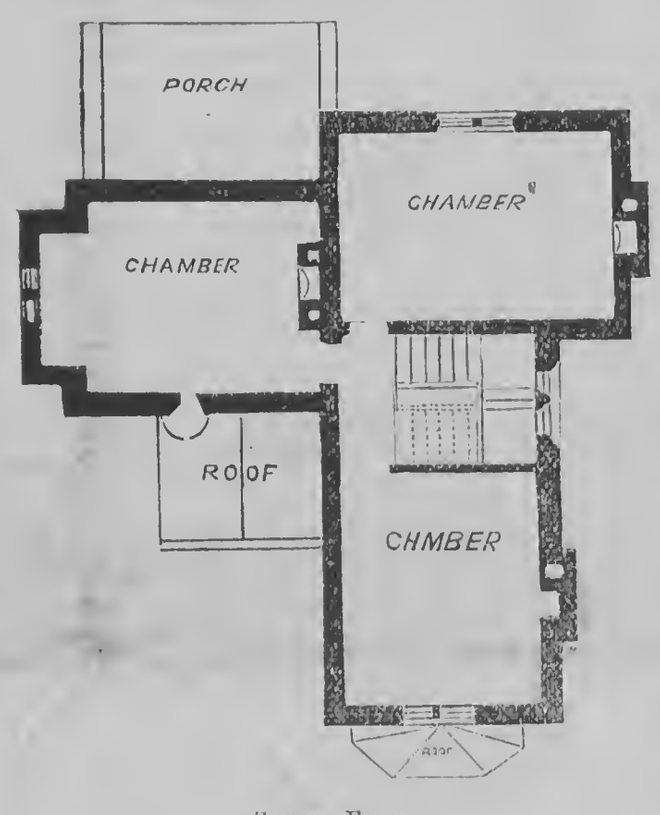
The rooms are in size as follows:—First Floor—Parlor, 14x16; Dining-room, 14x18; Kitchen, 14x16; Porch, 8x8; Scullery, 9x9. Second Floor—Chamber over parlor, 14x16; over dining-room, 14x18; over kitchen, 14x16.

If constructed of brick, with stone corners and caps, with cellar throughout, stone foundation and slate roof, and finished in first-class style, this cottage can be built in most localities for $5,000. Of course the cost can be materially lessened, or even increased, according to the wishes and tastes of the builder.

For one who can command the requisite means, a house built on this plan, modified, perhaps, in some details, and with well-planned surroundings as indicated, there will be few plans found more thoroughly satisfying.



FIRST FLOOR.



SECOND FLOOR.

COLOR OF ROOMS.

In rooms to be lived in, simply white for color of walls and paint, as well as any extremely dark treatment, should be avoided. The walls of rooms should be of such backgrounds as will best suit the complexion and dresses of the larger number of people. Delicate white intensifies, by contrast, any unpleasantness or want of perfection; extreme dark would make people look white and ghastly. Neutral colors will be found the best—generally some gray or cool color that will contrast with warmth of complexions. On no account let an absolutely pure color be used for general surfaces. Nature provides no such color in pigments. Her yellows are greenish or reddish, and so on. Nor does she use it to any extent in inanimate nature. So much so that you will find that, if you have much difficulty in describing a color, you may be certain it is good; the more difficulty the more beauty. Nature trusts mainly to gradations of tone, using vivid color in small quantities only, as in the touches on bright flowers and butterflies. This teaching of Nature will be found seconded in the pictures of the greatest artists, and, in following such teaching, it is necessary to consider the object to which (in domestic work, say) the rooms are to be devoted. A drawing-room, it is agreed, should be light, festive and gay; a dining-room at once more sober, and with more depth and warmth, as befits its uses. You must also consider the light and shade, openings and the positions of them, for these may, or may not, effect for you contrasts of tone, and may even touch the question of the good sense of your whole scheme of decoration.—*Builder (England)*.

HOW TO NAIL CLAPBOARDS.

THE Practical Farmer says that clapboards are often split by driving large nails into the board that has just been put on, sometimes checking the stud on which the clapboard is nailed. This induces leakage and often speedy decay. The proper method is pointed out as follows: After one board is nailed on, let the support nails be stuck into the sheathing boards or studs, so as to rest on the upper edge of the board below. Then, after the ends are fitted, draw out the support nails and lap the lower edge of the clapboard on the board below not less than one inch. By observing this direction, no cracks will be produced near the lower edges of the boards. It will pay well, also, to make holes for nails with a sharp brad-awl.

SHEDS FOR CATTLE.—As a rule, it is not advisable to erect temporary sheds for farm stock. If owner of the farm, it will be found to advantage to build substantial barns with basements beneath for stock and plenty of storeroom above. This is not only warmer shelter, but it saves a vast deal of labor in carrying feed. Besides, for the amount of room furnished, a high building is always relatively cheaper than a low one. It costs no more to roof a building 26 feet high than one only 10 or 12. The first-named building will be an ornament to the place and add to its selling value.

FRONT ELEVATION.

SIDE ELEVATION.

DESIGN FOR A GOTHIC COTTAGE.

Field Crops.

THE AGRICULTURAL EXPERIMENTS AT CORNELL.

During the past year numerous experiments on various subjects connected with farming have been in progress on the experimental farm connected with Cornell University. Some very interesting and valuable results have been obtained. From a report of these in the Utica Herald we copy this week what relates to the experiments with fertilizers in corn culture:

Last summer careful experiments were made to determine whether corn chiefly demands of the soil nitrogen or phosphoric acid, and to discover which fertilizing agent is most valuable for corn. It was desired to test the effect of phosphates. Thirty-three plots were prepared, measuring one-sixteenth of an acre each in area. Commercial fertilizers vary so much in composition, and are so frequently adulterated, that Prof. Caldwell prepared all his fertilizers himself in the laboratory. Uniform amounts by weight were applied to each hill, and the hills were counted. The fertilizer in each case was thoroughly incorporated with the soil. Among the fertilizers employed were farm yard manure, phosphate soda, sodium nitrate, mixtures, peruvian guano, potash salts, fish scraps, superphosphates, plaster and Epsom salts. The corn was planted, but the season was unfavorable, and the corn germinated badly. Notwithstanding this relative results were gained. There were no marked differences in the quality or quantity of the corn produced upon the different plots. The plot enriched by farm yard manure yielded more corn than any other plot. The next best results were produced by plaster and potash salts. The superphosphates produced a fair yield. The guano caused no marked production. The fish scraps seemed to extract the moisture from the soil, and there was but meager germination. This experiment will be exactly duplicated next year, and corn from each plot will be analyzed to determine the relative amount of each element extracted.

Besides these chemical experiments, Prof. Roberts has conducted a series of experiments intended to illustrate the results of different modes of cultivation. He planted corn under fifteen conditions, and carefully noted the result. The following table is a record of the experiment, the yield being presented in pounds:

1—Ridge culture	352	55	407
2—Deep "	290	19½	309½
3—Shallow "	324	43½	367½
4—Continuous culture (7 times)	362	22	382
5—Drill "	365½	18	383½
6—Five stalks in a hill	360	28	388
7—Four " " "	438	44	482
8—Three " " "	301½	127	428½
9—Two " " "	266	49	315
10—Unlimed eastern (com.)	335	51	386
11—Limed " (200 bush. per acre)	491	57	548
12—Not suckered	84½	12½	97
13—Suckered (twice)	76½	10½	87
14—Unlimed western (not fully matured)			94
15—Limed " (20 bush. per acre)			545

Note.—A little ashes was mixed with this lime; by analysis about 20 per cent.

It will be seen that the limed plot produced much the largest yield, and that a slight difference was caused by suckering. Prof. Roberts will also duplicate his experiments.

"PERENNIAL WHEAT."

Mr. Miller, residing near Salida, Cal., informs The Pacific Rural Press that he has in his garden a species of wheat which may be termed perpetual. A few kernels of the grain were furnished him and sown. It matured and bore a healthy crop, and continues sending out new shoots from the parent root. These new shoots continue to present themselves and bear their crops, when immediately another one comes from the same root. The same roots, first presenting themselves two or three years since, are still alive and have borne several crops. Moisture and warm weather are all that are required to keep it constantly reproducing itself.

What would the farmers of this country think, if a few years hence any improbable or impossible yarn should only be greeted with a shrug of the shoulders and the remark, "That's only a grain story," as people now say "only a fish story." Wouldn't they think it a disgrace to their credibility. Yet we never heard a fish story half so improbable as the above.

Suppose we vary it a little. In the same State, California, where this wonderful Perennial Wheat is found, farmers often grow a second crop without sowing any seed, not in isolated spots but over large fields embracing many hundred acres. Sometimes the land is lightly plowed for this second crop and sometimes only harrowed; but in either case the "volunteer" crop is generally inferior to the first. The farmers of California however, are not so stupid as to think they get wheat without seed. They know that the volunteer crop comes from wheat shelled upon the ground during harvest time. It was reserved for a man, evidently not a farmer, who had the same phenomena occur in his garden, to be fooled into thinking his second crop sprung from the stub of the dead root, the moral of which is when making observations be quite sure the facts are as they seem at a superficial glance. Wheat is a biennial, and might possibly be kept over until the third year by careful watching to prevent its seeding, but certainly not otherwise.

THE CASTOR BEAN.

The Chicago Weekly Tribune says:—Among the farm products assuming prominence in the West is the castor bean. It has been discovered that the grasshoppers and chinch bugs will not touch the plants (the bugs, in this case, have the sympathy of all boys), and within the last two years the increase in the crop has been 200 per cent. This has cut off importation of the beans, and an unimportant farm product becomes an important and, under favorable circumstances, a profitable one.

Within the last few years we have personally urged the consideration of this product on farmers who received all statements with an incredulous smile, as though the castor bean never was and never could be of any value on the farm. But if they sell for $1 per bushel and an acre produces a goodly number, and if the demand for them continues, why not experiment in this direction? We are not among those who favor headlong experiments, but favor a course in which the farmer makes his business one of greater possibilities without much risk.

Any good corn land will produce castor beans and a-half bushel will plant eight acres. The hills should be 4 or 5 feet apart, four or five seeds in a hill. If the cut-worms do not do the work for you, thin to one or two stalks in a hill. The yield is about twenty bushels to the acre.

BROOM CORN—PROFIT.

Among the reports to the Massachusetts Agricultural Society on broom corn culture is one in which the net profits on one acre of broom corn are put at $80.72, estimating the brush at 7 cents per pound and the seed worth 45 cents per bushel, or in other words a crop of 1,159 pounds of brush and 88 bushels of seed to the acre. Many farmers make no use of the seed, and we remember cases in which great piles of it counted for nothing. There are other cases that come to mind in which the seed, as it was stripped from the brush, was looked after carefully, and found an excellent food, during the winter, for geese and chickens and for cattle.

Broom corn should be planted on good strong land, 3 quarts of seed to an acre, cultivated as it for corn, and when the corn has grown to full size bend down the top about 1 foot below the brush. On that on which the seed is to ripen, do not break until the seed is ripe; on the other, before, and in such manner as to expose the brush to the sun as little as possible, so as to preserve its color. One point often neglected by those who have little experience is care after cutting, avoidance of rain and dampness. Very fine brush is often injured or spoiled by injudicious packing in bundles before it is cured.

POSSIBILITIES OF CORN CULTURE.

From an essay read by H. C. Haskell of Deerfield, Mass., we copy the following:—The results of a series of experiments, by members of the Elmira Farmers' Club, seem to hint at the possibilities of the case. In one experiment, the yield of corn from a single grain was twenty-four ounces, equivalent to a bushel from thirty-seven grains. At this rate of production for an entire acre, allowing to each grain four square feet of soil would give 294 bushels of shelled corn. In another experiment, the yield from a single grain was 31⅛ ounces, which would give a bushel from twenty grains or 393 bushels per acre. In another, the yield was 37½ ounces, or a bushel from twenty-four grains, or 453 bushels per acre.

The most successful experiment of the series, was the yield of 43½ ounces, which is at the rate of a bushel from twenty-one grains or 500 bushels per acre. What has been done, can be done again. What one grain of corn has been made to produce, every grain if 10,000 like it, allowing a reasonable margin for accidents, may be made to produce. As yet we have scarcely begun to realize the possibilities of high farming.

American Potatoes in England.—A writer in the London Garden denies that American Potatoes degenerate in England unless seed is annually imported. Such at any rate is not the case with the Rose. He has grown it for six successive years and states that it was finer last year than on any preceding one. The rose in England is much affected by soil, and the statement is made that in many localities it is scarcely eatable, and that many imported varieties have been at a disadvantage because the soil was not suitable. The same correspondent state that the greatest percentage of diseased potatoes is found in the Eureka and Snow Flake.

Farm Economy.

TOO EXPENSIVE IMPROVEMENTS.

Mr. Richard Thompson communicates to the Colonial Farmer of Fredericton, N. B., an account of improvements made in five acres of stiff clay land by draining. He sent to England for their practical drainers, who took the job, digging 558 rods four feet deep and twenty-four feet apart at sixty cents per rod, twenty-eight rods six and one half feet deep, twenty-four feet apart, at $1.20 per rod. Extra work in open ditching and building outlets $9, making $370.40. Eight hundred drain pipes one and one-half inches at $9 per thousand, 6,300 do., two inches at $10.50, 1,529 do., three inches at $16, and 480 do., four inches at $20. Cost of pipes $107.39. Whole cost $478.79. Cost per acre $95.96. The men earned $2.50 per day each. The pipes or tile are one foot in length. In 1875 the land was sowed to roots, and the yield was, per acre, of turnips 660 bushels. Carrots, 467 bushels. Potatoes, 289 bushels. Parsnips, 359 bushels. Mangels, 800 bushels. In 1861, before draining, the field was equally well manured and sown to roots, with the following yield per acre: Turnips, 300 bushels. Carrots, 179 bushels. Mangels, 140 bushels. The surface of the land was such as to require much deep digging.

The above paragraph is clipped from an exchange, and we copy to protest against the idea which it will convey to the great majority of farmers that underdraining is necessarily so expensive a process as is here described, costing nearly $100 per acre. No doubt the experiment is reported correctly, and it is almost as certain that the favorable result was intended to impress the minds of farmers with the profit of the operation. The effect will be really exactly the reverse. It is only shown that underdraining pays in the cultivation of special crops more frequently grown by market gardeners than by farmers. Average farmers, growing corn, oats, wheat and barley, will necessarily infer that such expensive operations are not for them, and, under the supposition that effective underdraining must cost nearly $100 per acre, they will naturally conclude that *they* cannot afford to do any underdraining whatever. Both these ideas are mistaken ones. In fact, as a guide for average farm draining, the example given is much worse than useless. It is very seldom advisable to have drains four feet deep. For farm crops it is never necessary an any land, fit for farm purposes, to make drains twenty-four feet apart. It is very seldom necessary in draining so small a piece as five acres to use so expensive and large a tile as five-inch pipe. Finally, we have always got drains dug for less than $2.50 per day, and by doing considerable of the work with plow team and subsoiler, have dug ditches for much less than we could hire men to dig them for. In all these items farmers can make material savings over the estimate published above.

In recommending farm improvements it should always be remembered that the great majority of farmers grow crops which, at the best, yield very moderate profits. A market gardener who has manured his ground at the rate of $75 or $100 per acre in growing early cabbage or celery, very likely makes money by so doing. He cannot afford to do otherwise. But his example cannot be literally followed by the farmer who is growing wheat, oats or barley. The most the farmer can do is to learn the value of thorough manuring and imitate with such variations as he can afford. The words "heavy manuring" mean entirely different things as applied to different crops. For some vegetables the market gardener finds it profitable to apply $100 worth of manure per acre; but others need only $30 or $40 per acre. In farm crops, on ordinary good land, $25 per acre in stable manure would be a sufficiency for corn or potatoes, and $15 per acre, top dressed, would be a good manuring for wheat.

We have known the wheat crop to be doubled by the use of $5 or $6 per acre in superphosphate drilled in with the seed. Each of these may fairly be called thorough manuring. A market gardener has no right to decry the farmer because the latter does not and cannot afford to use $100 worth of manure per acre. The farmer, not growing such exhaustive crops as the gardener, does not need to pay so much for manures, and yet each may be doing the very best in his situation. Neither can afford to stop short of manuring his soil to the limit where more manure ceases to be profitable. In the garden this will be far greater than the amount which can be used on most farm crops.

It is the same with underdraining. All farmers whose land is wet and cold should underdrain some. If the land will not pay for this sell out and buy where it will pay, or the land does not need so much underdraining. Usually, however, all land fit for farming can be sufficiently underdrained for farm crops at a cost not exceeding $20 or $25 per acre—often for $15 per acre. These drains well laid will last a life time—are, in fact, a permanent investment, so that to be profitable we need only a good, liberal percentage as interest. Ten per cent. a year, or $2.50 per acre on the extreme cost of underdraining, ought to pay in almost any farm crop. Often, however, we have known the entire cost of underdraining a field to be paid in two or at most three crops of wheat—the investment thus paying thirty-three or fifty per cent.

How to economize in underdraining is a most important question for farmers. It is necessary if underdraining is to be encouraged—not among those who grow special crops and can afford to improve their land without much regard to expense—but among the great mass of average farmers throughout the country. We believe not only that the cost of underdraining can be much reduced; but that by proper management the amount of underdraining needed may be greatly lessened. This, however, must be left for another article.

BURNING GRAIN STUBBLE.

A writer in the Weekly Sun advises a return to the practice of burning wheat stubble. It is probable that the failure of wheat is due mainly to loss of fertility in the soil which would be common to any system without manure. Still his ideas are suggestive and we copy as follows:

I have lived in Lasalle county, Ill., almost since its earliest settlement, or since the fall of 1830; and I have seen it in all of its stages, from its most wild and barren waste (that is so far as the cultivation of the soil was concerned) up to its present light and flourishing state of cultivation, which has made this beautiful expanse to blossom like the rose, in all except wheat, which has gradually deteriorated until most farmers think it cheaper to buy their flour than to try to raise wheat, even for their own use.

In early times we considered this a good country for wheat. It is true fall wheat would sometimes winter-kill, rust, or fall down, but these were exceptions; otherwise, we were sure of a good crop.

The much dreaded chinch bug was scarcely known to exist; yet, by the more observing they were noticed in the corn husks at husking time; but they were not known as such enemies as they really are, for up to that time they were not numerous enough to do but very little if any damage to the wheat crop.

In those days the stubble was invariably burnt, and thus destroyed enough of the insects to hold them in check, and at the same time destroying millions of weed seeds, thus making the cultivation of the soil quiet easy. I have noticed time and again, in the cultivation of a corn crop, I could tell to a row, which part of the field had been burnt over and which had not, the ground being so much finer, more moist, looser, and more free from weeds. The corn also would be larger, ripen a little earlier, and yield more on the burnt portion.

I have also noticed that in just the proportion that farmers quit burning their stubble the wheat-crop began to deteriorate, and became more and more uncertain, until for many years past in this country wheat raising has been a failure, with an occasional exception. We import annually the flour of thousands of bushels of wheat for home consumption, while in former years we exported thousands of bushels anually as a surplus.

We used to think that if we only had a raw piece of prairie sod to break up in June, and then to sow to wheat in the fall following we were almost certain of a good crop of wheat; but in later years the virgin sod seemed no more certain for wheat than old ground and from that standpoint many say that it proves that the burning of stubble is all a delusion. I take a different view of the question when we know that the prairies were annually burnt off by the red man, as certain as the seasons came and went, for ages past, and leaving all the effects of that burning upon the soil to work its changes.

It is well known how quickly the prairie grass dies out when not burnt annually at the proper season of the year, and all goes to weeds and blue grass, as we term it, and then if broken up is very uncertain of being good for wheat, having lost in a measure the benefit of the burning, to make the wheat what we used to raise in earlier times. As near as I can learn, this has been the experience of all new countries; good for wheat for a time, and as the fires cease to burn the grass, leaves or stubble, the wheat crop decreases proportionately, until it does not pay for the raising.

Again, some argue that the stubble enriches the ground much more when ploughed under than when burnt. My experience is to the contrary. I think a good, clean burn is worth more to any succeeding crop, than to plow under a heavy stubble, to say nothing about the destruction of insects and noxious weeds.

Rain water brings down yearly about 12 lbs. of ammonia per acre of ground. To supply an equal amount in sulphate of ammonia at 6 cents per lb. would cost the farmer $2.88, and this is, therefore, the manurial value of the rain. To this, however, must be added a certain quantity of nitric or nitrous acid.—*Galaxy.*

Dairy Husbandry.

GRAIN RAISING AND WINTER MANAGEMENT OF DAIRY STOCK.

In our recent visit to Cortland and Broome Counties, we met many members of the Killawog Farmers' Club, a well organized and spirited association and which is doing much good in that section. Butter dairying is the leading branch of farming about Killawog and Marathon, and butter is made for the most part at the farm. Mr. GEO. SCHERMERHORN, the President of the Club, who has a fine farm near Killawog, believes in Short-Horns and Short-Horn grades for butter dairying, and he has some exceedingly fine animals in his herd. His stock of calves, of which quite a number was raised last year, is very superior and they show careful rearing.

After looking over this herd Mr. S. kindly drove us over to a neighbor, G. P. SQUIRE, who has a farm of about 200 acres near Marathon, N. Y., and a herd of 40 cows, nearly all of which are Short-Horn grades and a nicer looking lot of cows we have not seen in a long time. In regard to their productiveness, it will be proper to say that the cows yielded an average of 200 pounds of butter each, last year, and this we understand Mr. S. to say was his general average during other years.

METHOD OF WINTERING THE STOCK.

The plan of wintering the cows on this farm differs so widely from that in usual practice in other sections that it will perhaps be of interest to our dairy readers.

The cows are kept on cut oat straw and meal. The straw is cut with a machine, driven by horse power, which is immediately above the stable, the cut straw dropping down into the alley between the two rows of cows. Each cow gets 15 pounds of cut straw and 2¼ pounds of bran and corn meal per day. The bran and meal are mixed in equal weights, and the whole is fed dry three times a day. The 15 pounds of cut straw makes three baskets, and each cow gets a basket of the straw in the morning, then at 10 A. M. another basket is given, and she gets also at this time the 2¼ pounds of the mixed feed of bran and meal, and at 4 P. M. the other basket of straw. The cows have a warm yard into which they are turned a short time every day to get water; but they are not allowed to be long out of the stable, Mr. SQUIRE believing they are safer and more comfortable in the stable than out in the cold during winter. He commenced feeding in this way about the 20th of December, and expects his straw will hold out to feed in the same way until some time in March.

Now under this management the cost per day for the feed of each cow is only 7½c.; thus the cut straw is put at $6 per ton, the corn meal at $30 per ton, and the bran at $22.50 per ton, the prices for the bran and meal being those which obtain at the market at Marathon. The cows are in very fine condition as to flesh—they are lively and apparently in perfect health. In fine, no dairyman could wish to see his stock in any better heart or condition.

The saving it will be seen in the cost of keep, is very considerable: for if they had been fed on hay alone, they would consume at the rate of 25 pounds each per day, and at the low price of $10 per ton the cost to each cow would be 12½c. per day, a saving therefore being made by Mr. S. over hay feeding of 5c. per day for each cow. But hay is seldom so low as $10 per ton, while with such large cows it is doubtful whether the 25 pounds of hay per day would produce so good results in flesh and health as the bran and straw. In feeding the meal it is scattered on top of the straw at the second feeding, and Mr. S. thinks better results are obtained in feeding both straw and meal dry than wet.

By this system of winter management of cows it will be evident a much larger herd can be carried on a given number of acres, than where hay is made the chief food during winter. The question then occurs, Whether more grain ought not to be grown on dairy farms than is the practice in some sections? The subject is a pertinent one at this season, and we hope Mr. SQUIRE's management will arrest the attention of those dairymen who do not believe in growing grain on dairy farms.

Mr. SQUIRE is a "wide-awake" young farmer. His buildings are large and commodious, and everything appears to be in good order on the premises. He has a fine Short-Horn bull, and his stock of horses and pigs show that he is determined to have the best.

CONDENSING SKIMMED MILK.

NOT long since my attention was arrested by a suggestion in one of our Agricultural papers, to the effect that the skimmed milk from our butter factories might be most profitably utilized by being condensed. Now I am preparing to operate a butter factory the coming summer, and if there is any foundation for such an idea, would like to know it. Thinking you might be able and willing to enlighten me, I will venture to propound the following inquiries:

1. Is there a demand for such an article at a profitable rate to the manufacturer? or if not, could a trade be established by persevering effort, without too much risk?

2. At what age must the cream be removed to insure the proper condition of the milk for said process, supposing No. 1 is answered in the affirmative?

3. Would such disposition of the milk be more profitable than feeding to hogs?

4. Where can the necessary apparatus be obtained?

5. Where can full directions for the process of condensation be obtained?

If you cannot answer the above fully, will you please hand the same to Prof. ARNOLD of Cornell or some one who can? By so doing you will much oblige—PHIL A. MOSES, *Morgan, Ashtabula Co., Ohio.*

1. SKIMMED milk was at one time condensed in the factories of Orange Co., N. Y., and the product found sale in New York. It was made into what is known as plain condensed milk—that is, without the addition of sugar. Such milk will keep several days. It was packed in large cans about the size of those used to convey fresh milk for city consumption; customers purchased it by the quart. When well made it is palatable, and when it comes to be used, if the buyer is careful not to reduce it too far with water, it has the appearance and taste of more richness than it contains. We suppose a trade would have to be established by the manufacturer, and when established it could be made profitable if a good article was furnished; for the milk would be better than much of the milk peddled by the milk venders.

2. The cream should be taken off when the milk is 12 hours old, and for this purpose the Swedish system of setting milk described in our "Practical Butter Book," could be employed with advantage.

3. We should say that such a disposition of the milk could be made more profitable than feeding to hogs, provided it was supplied in limited quantities or not above the wants of an established market. To a man of enterprise, who was within convenient distance of some of our leading cities and who could work up a trade with milk consumers, supplying them regularly from time to time, we should say the business could be made very profitable.

4. The apparatus for condensing milk was, and we suppose now is, made in Williamsburg, N. Y.

5. The only treatise on condensed milk that has been written, so far as known to us, was furnished by the Dairy Editor of this paper for the Royal Agricultural Society of England and printed by the Society in pamphlet and in its Journal. The same author also delivered an address on the subject before the American Dairymen's Association. These give a pretty full account of the process of condensing milk and the apparatus connected therewith.

There is no writer on dairy matters by the name of ARNOLD connected with Cornell University. Mr. L. B. ARNOLD of Rochester is a writer on dairy matters and has been sometimes called Professor in the newspapers, but he has no connection with any college, the title being gratuitous.

CONSTRUCTION OF DAIRY HOUSES.

MR. GODDARD, one of the judges at the great Cheese Show recently held at Frome, in Somersetshire, Eng., gives some useful hints in regard to the construction of dairy buildings. They should be constructed so that temperature may be easily regulated, that you may exclude or introduce the air at pleasure. He recommends that the walls should be made double or hollow, the air space within as wide as possible, on the principle that confined air is a very bad conductor of heat. The windows on the same principle should be double, one opening outside and the other inside of the dairy; or there should be double shutters, made to fit tight and to exclude the air when shut. These remarks apply also to the curing room. He advises also that the outside walls and even the roof be made of a white color, as white repels the rays of the sun, while dark absorbs them. The heat should be kept out in summer. Whitewashing the roof, giving two or three coats a year, is recommended.

THE DAIRY IN ST. LAWRENCE CO.

THE amount of dairy products made in St. Lawrence Co., N. Y., during the past year (1875) is estimated to be of cheese, 8,500,000 pounds, and of butter, 10,500,000 pounds. The total shipments of cheese from Ogdensburg by way of the Rome, Watertown and Ogdensburg R.R. during the year ending Dec. 31, 1875, were 5,916,179 pounds. Of butter shipped for the same time there were 4,302,797 pounds.

This makes a fair showing for St. Lawrence Co. farmers. If the cheese be estimated at 10c. per pound we should have the whole product bring $850,000; and the butter at 30c. would come to $3,150,000—making in the aggregate $4,000,000.

The Swine-Herd.

LIGHT NECESSARY FOR GROWING ANIMALS.

A WRITER in the Chicago Weekly Tribune relates some incidents in feeding young pigs which strongly show the importance of sufficient light to secure their best thrift. It is often thought, in winter especially, that warmth is the only requisite, and these experiments may set some of our readers to thinking differently. We quote what he has to say on the subject:

"The sows which had litters on the 18th and 22d of January, respectively, were kept in the two rather dark, but warm, temporary sties, and had to occupy them till about the middle of the present month, when, for each sow with litter, one of the permanent sties was opened by selling the occupants. At that time the pigs which had been kept in the dark, temporary sties proved to be less lively than, and much inferior in weight and size to, those of any of the litters raised in the less warm, but well-lighted, permanent sties, notwithstanding that the difference in age was very small, and that food and care had been the same in every respect. One of the litters born on the 15th of January, which had accidentally the best-lighted sty, though situated in the northwest, and consequently coldest, corner of the frame building, exhibited the most rapid growth, and the litter born on the 18th of January, which had the darkest sty, had made the poorest. The sows in question are full sisters and of the same age. Since the pigs which were born in the dark sties have been transferred to the light ones, which is now about two weeks, their growth has been a very satisfactory one, and their liveliness and playfulness are now equal to those of any of the other litters."

The experiment is not conclusive, but it certainly is suggestive. There is a difference in the natural capacity of different sows to give milk, both as to its amount and nutritive qualities, which may account in part for the difference in growth of the pigs. Possibly the effect of light on the mother may be to make them elaborate more and more nutritive milk.

It is pretty well established by experience that most animals fatten more readily in the dark; but this fattening process is often the reverse of healthful. Animals kept in the dark pass all their carbonaceous food into fat, chiefly because the liver and other organs cannot work in the dark so as to strain it out. Fat and flesh thus accumulated lacks the highest nutritive properties and cannot be fit food for human beings. The stimulating effect of wild game of every kind is well understood. May it not be due to the fact that the flesh of wild game is always grown in open air, with abundance of oxygen, a healthful action of the liver and plenty of light. Pork has the smallest proportion of nitrogen in its composition of any kind of meat, which is in part because the hog is from birth usually confined to a small and often dark pen. Beef which has been fattened to excess under similar conditions is also less healthful than where cattle have for most of their lives had free range in pastures and have retained their health.

In considering the best methods of keeping stock farmers are too apt to regard only the money profit of the different plans. It ought to be remembered that man is far the most important animal on the farm, and the health and well-being of the family ought to subordinate every other consideration.

SUMMER CARE OF HOGS.

MANY farmers seem to think that fall is the only time in which pork can be made profitably. In the winter they try to find out how small an amount of food will sustain life in their pigs. During the spring they experiment in the same direction. In the summer they turn their pigs out to grass in a dry pasture, allowing them to shirk for themselves, or else shut them up in a tight pen and feed them as small an amount of dry corn as is consistent with their keeping alive. During three-fourths of the year hogs are kept on a short allowance, and, of course, their gain is very small.

About the time corn is harvested farmers commence to rush things. Hogs must now be fattened in a hurry. Now they receive about as many ears as they have before received grains. They are stuffed like sausage till their skins will hold no more. They are fed so much that they cannot digest half of it. The wonder is that more of them do not die of cholera. They grunt from fullness now as a little while before they squealed from emptiness. From a hungry, half-starved creature the hog passes to a gourmand. The farmer who was stingy of his corn before is now prodigal of it. He is impatient to see the machine in motion that changes it into pork. He wishes it would work faster.

This method of doing things is all wrong. It is contrary to nature, reason and economy. To produce pork to the best advantage, hogs should be kept growing all the year. During no time in the season can pork be made so cheap as in summer. Clover is a cheaper material to make it from than corn. It grows without cultivation or care. Hogs will eat it where it grows, which saves the labor of harvesting. It is a common thing for early pigs to gain a pound a day on clover alone. There is not so cheap or easy way to make pork as this. The addition of one pound of soaked corn to their grass food will cause a larger growth, though too much corn must not be given, for the reason that they would neglect to eat clover.

At all times of the year hogs should be kept in a good, growing condition. They should never know hunger or be allowed to run down. Their gain should be steady from the time they are weaned till they are slaughtered. During summer they should have the run of a good clover pasture, and receive grain in addition according to the state of the feed. They should have shade, and if there are no trees to furnish it, sheds should be constructed. They should have pure water in abundance. If practicable, the should have a place where they can wade in clear water, though bathing advantages are to be classed as luxuries rather than as necessities.

There is no doubt of the fact that farmers do not sufficiently consider the advantage of a change of food for hogs. Next to man the hog eats the greatest variety of articles of food. It delights in flesh, grass, grain and fruit, and when at liberty to choose will devour them all at a meal. Hogs will always be more healthy and gain better when they have a variety of food. In the East apples, potatoes, roots and sometimes fish are fed to hogs, and it is well known that diseases peculiar to hogs are fewer there than in the West, where they receive little but corn to eat. It is said that the best-flavored pork in the world is found in Germany, where a great variety of food is fed to hogs.

Hogs at all ages are fond of food that contains sulphur. It is doubtless for the sulphur it contains that hogs eat soft coal, and they appear to thrive on it. They are also very fond of mustard, which contains a good deal of sulphur. As this plant is very easily raised, producing as much feed as almost any plant that grows, there would seem to be economy in raising it for hogs. It may be said that it is more economical to buy the sulphur in a concentrated form, but it should be remembered that pure sulphur is not in a form to be readily taken up by the system, while that contained in mustard and other plants is readily assimilated.

HOG CHOLERA.

Hog cholera is known as "Blue Disease," "Red Soldier," "Distemper in Pigs," etc. This is undoubtedly a blood disease, and belongs to the anthrax type of fevers.

Symptoms. The disease sets in and usually secures a firm hold upon the animal before its presence is suspected. The one affected will isolate himself from the rest and burrow in the litter, often remaining thus till death, though sometimes they will run about as if wild, grunting and squealing as if in great pain. Dullness, drooping head and ears and loss of appetite are the symptoms observed, if at all in the first stage. In what may be called the second stage, the abdominal pains are indicated by lying on the belly, with fore-feet outstretched, and, when caused to move, uttering shrieks. The skin takes on a purple color, particularly upon the back and ears, along the abdomen, and inside the thighs. The pulse is rapid, but feeble. Diarrhea sets in, and becomes profuse in the third stage. The dejections are black and offensive. The pulse weakens and finally becomes imperceptible. Breathing is difficult and spasmodic, owing to the condition of the lungs, and an irritating cough comes on. General weakness is now apparent; the animal can scarcely stand, his legs get entangled like a tipsy man's, and complete paralysis soon results. Eruptions on the skin may have followed the first discoloration, which now are succeeded by sloughing and ulceration. Insensibility precedes death from three to six hours. The malady sometimes appears in less fatal forms, accompanied by colored skin and loss of appetite for a few days, when recovery follows; but this is uncommon. On *post mortem* examination the appearance of rapid decomposition is manifest, and all the tissues seemed transfused with blood.

Treatment. After diarrhea sets in death is almost certain. Before that event, administer quickly (by means of a drenching-horn or long-necked bottle, and, if the pig is large, tying him to a post with a rope around his upper jaw): Epsom salts, two to four ounces; sulphur, two to six drams; gentian and ginger (powdered), one to two drams; molasses, two to three tablespoonfuls; gin, one-half pint. Cold water sponge baths and friction with a course cloth are useful if they can be borne, and this treatment must be gentle. Clean bedding and comfortable pens, with light diet of vegetable food, are required. A free run in a bare pasture or lane is a great help. In this, as in all other sickness, when possible, prevention is the best treatment, and simply consists in careful feeding, plenty of vegetable food, cleanliness and exercise.—*Prof. Cressey in Scientific American.*

The Poultry Yard.

EATING AND LAYING OF HENS.

In an article, some time ago, I took the ground that "the fowls which eat most are, as a rule, the most profitable," this I re-assert and will try to prove. To start with, it is the same with all animals kept for the production of flesh, as cows, hogs, sheep, and fattening cattle. Let me cite some instances,

1st. In Germany, in 1871 or '72, an experiment was made as follows: Four Dutch cows, two large and two small, were selected and put in two pens, two in each, and both were fed all the green corn they would eat; at the end of sixteen days the large pair had eaten 4,921 pounds of lucern and given 272 quarts of milk, and the light pair had eaten 3,869 pounds of lucern and given 192 quarts of milk; the heavy pair had given 6 quarts of milk for each 100 pounds of lucern consumed, and the light pair had only given 5 quarts.

2d. In Dr. Miles' experiments at the Mich. Agricultural College, six pigs of the same litter were put in two pens—three in a pen—and in both pens the pigs were allowed all the corn meal they could eat. One pig in pen B met with an accident and was killed. When 30 weeks old the pigs weighed as follows: Pen A, pig 1, 59 lbs.; pig 2, 69 lbs.; pig 3, 133 lbs. Pen B, pig 4, 156 lbs., and pig 5, 142 lbs.

The pigs in pen B ate 61 per cent. more food than those in pen A, and gained 92 per cent. more. This result was owing to pigs 1 and 2, though perfectly healthy, gaining so little. At this time the Dr. put the three pigs of pen A into three pens. During the first week pig 1 ate 11 lbs. of meal, pig 2 ate 12½ lbs., and pig 3 ate 25½ lbs. During the month the pigs ate and gained as follows: Pig 1 ate 48½ lbs, lost 1 lb.; pig 2 ate 51½ lbs. and gained 4 lbs., and pig 3 ate 100 lbs and gained 19½ lbs.

I have no time to hunt up experiments with sheep and cattle, but all will recollect that most writers advise getting those "capable of eating, digesting and assimilating the most food."

I have bred Light and Dark Brahmas, Buff Cochins, Black Spanish, Hamburghs, Dorkings and Dunghills, and will give you some figures.

Flock No. 1. All Light Brahmas.

Dr.		Cr.	
30 fowls at 50c	$15.00	Eggs, 160 doz,	$65.43
Feed	21.12	Chicks sold	18.21
Eggs set	5.00	On hand	31.50
Total	$41.12	Total	$115.14
		Less	$41.12
			$74.02

This leaves $74.02 profit on the flock, or nearly $2.50 per head.

Flock No. 2. Black Spanish.

Dr.		Cr.	
30 fowls at 50c	$15.00	172 doz. of eggs,	$34.44
Feed	12.17	Chicks sold	9.11
Eggs set	2.34	On hand	17.00
Total	$29.51	Total	$60.55
		Less	$29.51
		Leaves	$31.04

This, as you will see, gives a profit of $31.04, or little over $1 each.

Now, with this in view, am I not justified in the grounds I take? My reasons for preferring the Brahma can be readily seen, their eggs brought me double what the others did. A neighbor who has kept Houdans and White Leghorns finds they lay no better and at no better season than the Spanish. There has been considerable "hifalutin" theorizing done to show that the Brahmas were poor layers, the above account shows them to be nearly as good layers as the Spanish, and the following from the Poultry World, p. 204, June, 1875, will show something. "Six Light Brahmas and six White Leghorns were put on trial and an account kept with each for one year. The first two months the Leghorns first maturing got the start, but after the Brahmas got to laying they steadily gained, and at the end of the year the account stood thus: Average, Leghorns, 171 eggs each, and Brahmas 168 each."

On page 237, July No., of same year, J. W. P. Hovey says of Light Brahmas: "With me they excel as layers, not excepting Houdans, Spanish, Leghorns and Hamburgs." Now I will close, though I may at some time send you my idea on feeding poultry. A. M. Van Auken.

Fort Howard, Wis.

THE TURKEY.

While visiting a poultry show at Tamaqua, Pa., a short time since, our attention was drawn to some fine large turkeys, and especially to a pair marked "Wild Turkeys." The cock bird in this pen was the handsomest turkey we ever saw. In symmetry he seemed to be perfect, while his plumage was simply superb. He was a three-year old bird, but showed none of the symptoms of age or debility.

This pair of birds made such an impression on us that we hunted up the exhibitor to learn their history. He said this cock was hatched from an egg found in a wild hen's nest in the mountains, and was raised on the farm. But since he was a year old, he and his mate take to the mountains when the spring arrives, and remain away till autumn, when they return with fine flocks of young ones, which they have raised without care or feed from their owner.

The statement was something of a surprise to us. In our community the young turkeys are carefully hunted up, brought home and fed every day until they have attained some size. This is perhaps necessary in a densely populated agricultural district; but those semi-wild mountain turkeys were certainly as fine as any we have seen anywhere. We weighed one gobbler, which turned the scale at thirty-two pounds, and numbers of them weighed from twenty-two to twenty-eight pounds each. As table birds they were equal to any we have ever tried. Many of our readers who live in wooded mountainous districts, should take a hint from this and what they can do in turkey raising. They may be raised in roomy places at a small expense, and always command a fair price in the market.

Some farmers object to having turkeys roaming over their fields before the harvest is gathered, but the objection is groundless. They really do no injury to the grain crops, while they consume innumerable insects of all kinds, which would be detrimental to the farmers' interests. It is true a flock will be destructive to a field of buckwheat, if they find it; but even here the loss is not great, as it is marketed in the shape of poultry instead of flour.

To give some idea of the turkey business, it may be stated that the annual product of Bucks County, Pa., alone, is over $200,000 worth. This may stagger some readers who have given the subject no attention; but when it is known that there are six thousand farms in the County, and turkeys are raised on nearly all of them, the figures will not be so surprising.—*Practical Farmer.*

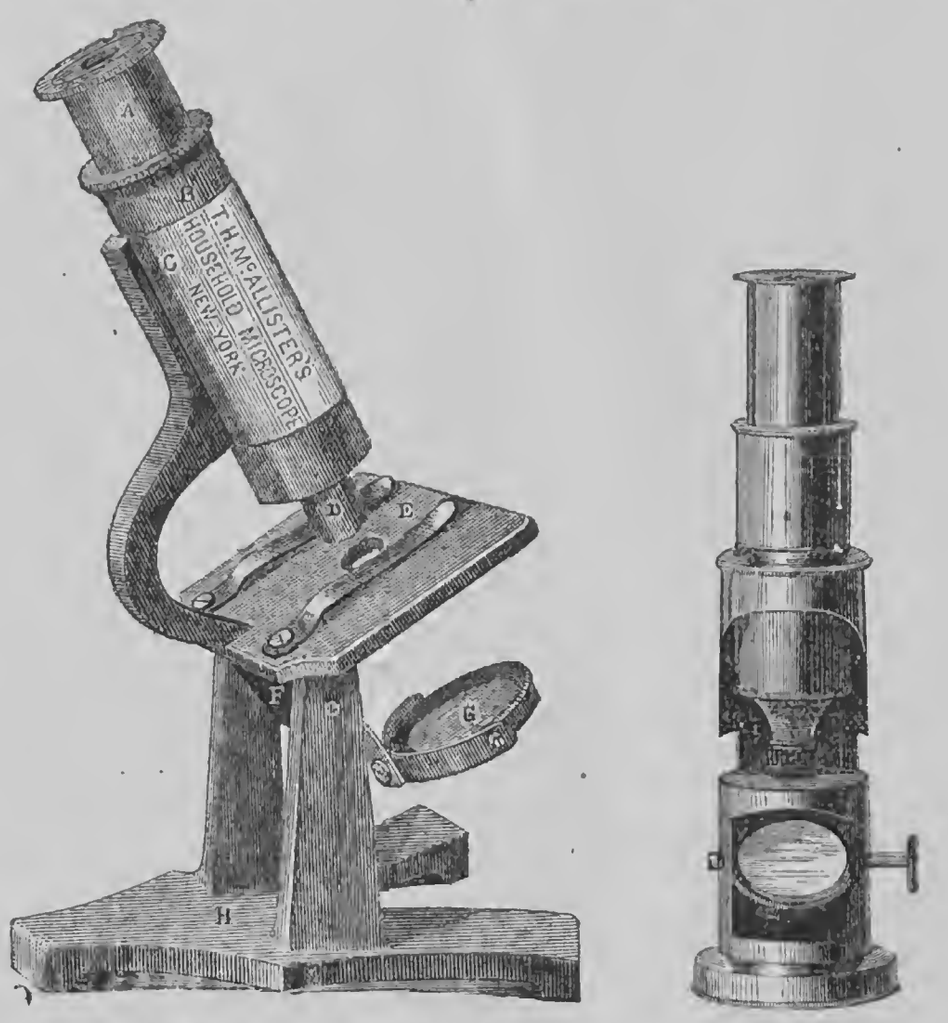
Our Premium Articles.

POPULARIZING THE MICROSCOPE.

The progress of popular science is nowhere more notably shown than in the general demand for instruments needed for scientific investigations. For example there are thousands of families where now the microscope is in frequent use as a diversion or for studying the wonders of nature, in which ten or twenty years ago the purchase and use of such an instrument would have been unthought of. There is an increasing interest felt everywhere on this subject, and instructions for the use of microscopes are eagerly read. Probably the cheapening of these instruments as well as the improvements in their construction, have added to their popularity. In the country, and especially during the growing season a good microscope becomes a constant source of instruction and amusement. The wonders of insect and partially of vegetable life are opened by its use as by nothing else. Every branch of natural science is under obligations to the microscope, and it is of frequent use in solving problems which daily arise in any family of active minds. For the family circle, and especially where there are children it is invaluable. Teachers in country schools will also find it an important help in enlisting the interest of their pupils in the natural sciences. The bias thus given in early life will often affect for good the entire after career.

Until within a comparatively recent period the cheaper forms of microscopes were mere toys, very imperfect in their optical and mechanical properties, and of little value except as curiosities. There were good microscopes, though the best then were not so good as now—but they were expensive—far beyond popular reach. Only a few students of science could afford to investigate by means of the microscope. Latterly, however the manufacture of the microscope has entered on a new era. Improvements have been devised which adapt the microscope to popular use making it cheap in price easily managed, and in short "a microscope for the people." Three of these styles manufactured by T. H. McAllister, No. 49 Nassau St., N. Y., seem to us best adapted for popular use and are included in our Premium List to Rural agents. They are figured on this page, and named respectively the "Household" and the "Youths" or pocket microscope, the latter an inexpensive instrument suitable for use in the fields, with brass body six inches high, and costing only three dollars. It will be found however that the household microscope, costing only five dollars will give much better satisfaction. With this will be sent two crown glass objectives, affording magnifying powers of every range from 20 to 100 diameters or 400 to 10,000 areas. The "Household" is a compound microscope, having all the essential parts of a first-class instrument, a miniature model of the most approved patterns, with a range of magnifying power adapting it to the investigation of the minutiæ of animal and vegetable life. The animalcule commonly present in pond water, the pollen of flowers, &c., can be observed and studied by its use.

The "Botanical" Microscope, not given in the illustrations, is a very handy little instrument, which is of great use to the investigator, on account of its very convenient size and shape. Those desiring any of these instruments, will find full and exact particulars by consulting our Premium List, or can get complete catalogues by addressing Mr. McAllister as above.



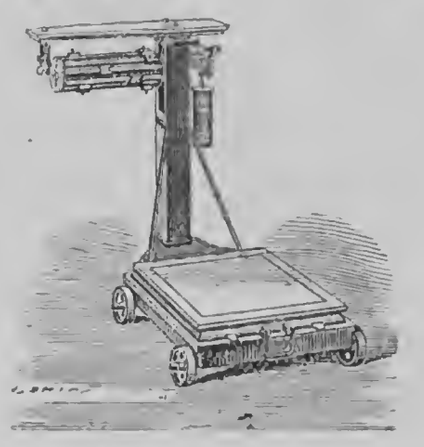
McALLISTER'S HOUSEHOLD MICROSCOPES.

Industrial Implements.

SELF-REGISTERING MILK SCALE.

Among the new and valuable improvements in Dairy Machinery is the Revolving Beam Milk Scale, invented and patented by Jones of Binghamton. This Scale weighs and registers each mess of milk as received at the cheese factory or creamery, and without the possibility of a mistake, saving time and bad feeling on the part of milk producer and the manufacturer. This scale is a novelty, and in the perfectness of its operations is characteristic of Jones himself, who has often introduced similar novelties and always with distinguished success. We do not doubt that this milk scale deserves and will meet with general favor among the dairying public. It will be sold as are all the Jones scales on the system inaugurated by himself—direct sales to the user, freight prepaid, and no pay required where full satisfaction is not given. This system takes all risk from the purchaser, while the popularity and perfection of the Jones' scales are such, that the sender has an absolute certainty of having them accepted.

The attention of readers is invited to Jones' advertisement, and farmers especially will do well to send for his free scale list of prices. This list embraces scales of every size, and in these days of general rascality, it is especially important that farmers taking grain or other produce to market should have at home facilities for weighing before starting. One farmer writes to Mr. Jones that he last year lost one hundred and eighty-five bushels of wheat because he thought



he could not afford to buy a set of scales. Now he is bound to have a set, afford it or not. Besides this, thrifty farmers need a set of accurate scales to keep a record of the experiments which every good farmer should make in feeding and weighing stock of various kinds, as also, what his produce costs him, what is the effect of various fertilizers, etc. We know the Jones' Scales to be first-class, and his system of doing business certainly commends itself to the confidence of all. Send to Jones of Binghamton, N. Y., for his free price list.

Scientific and Useful.

THE ABSORPTIVE POWER OF SOIL.

It is an important discovery of recent date, that soils have the power of separating not only ammonia, but other bases also, from their solutions, and of holding them with great tenacity after their absorption. Thus 100 grains of clay soil, taken from the plastic clay formation of England, absorbed 1,050 grains of potash from a solution of caustic potash containing one per cent. of the alkali. It is interesting to observe that the liquid was not, in this case, filtered through the soil, but the cold solution was merely left in contact with it for twelve hours.

It has been further shown that soils have the ability to separate the alkaline bases from the acids with which they are combined. When saline solutions were slowly filtered through soils five or six inches deep, the liquids which passed through were deprived of their alkaline bases, as potash, soda, ammonia and magnesia, and only the acids were to be found in combination with some other base. Thus, when muriate of ammonia was filtered through the soil the ammonia was removed, and a corresponding quantity of lime, in combination with muriatic acid, was found in the filtered liquid. In the same way sulphate of potash was deprived of its base, and the liquid collected gave sulphate of lime.

Those soils which have the greatest amount of capillary porosity will condense the greatest amount of manurial substances on their internal surfaces, will retain them longest against the adverse solvent action of water, and will give them out most readily to the rootlets of the growing plant.

A mass of adhesive clay will absorb but a very slight amount of available manure; but if this same mass is rendered friable, by mechanical processes, its power of absorption is amazingly increased. In view of what has been stated, it is very clear that one way in which plowing increases the fertility of land is by increasing its porosity by pulverization.

Again, many manurial substances exist in the soil, which, being insoluble, exercise no action on the growth of plants, and contribute nothing to their nutrition; but by the slow, though regular action of the frosts and the rain, the air and the sunshine, insoluble and refractory compounds are reduced to a soluble state, and are appropriated and held on deposit by the soil to the credit of the next cultivated crop. This explains the well known fact that soils, which have been cropped to the very verge of barrenness, will recover their fertility if allowed to remain long enough under the action of climatic influences to saturate the soil with the necessary plant-food, which they have unlocked from their chemical combinations, and given to the soil in a proper physical condition. These changes are brought about more rapidly when certain mechanical changes of condition are wrought upon the soil.

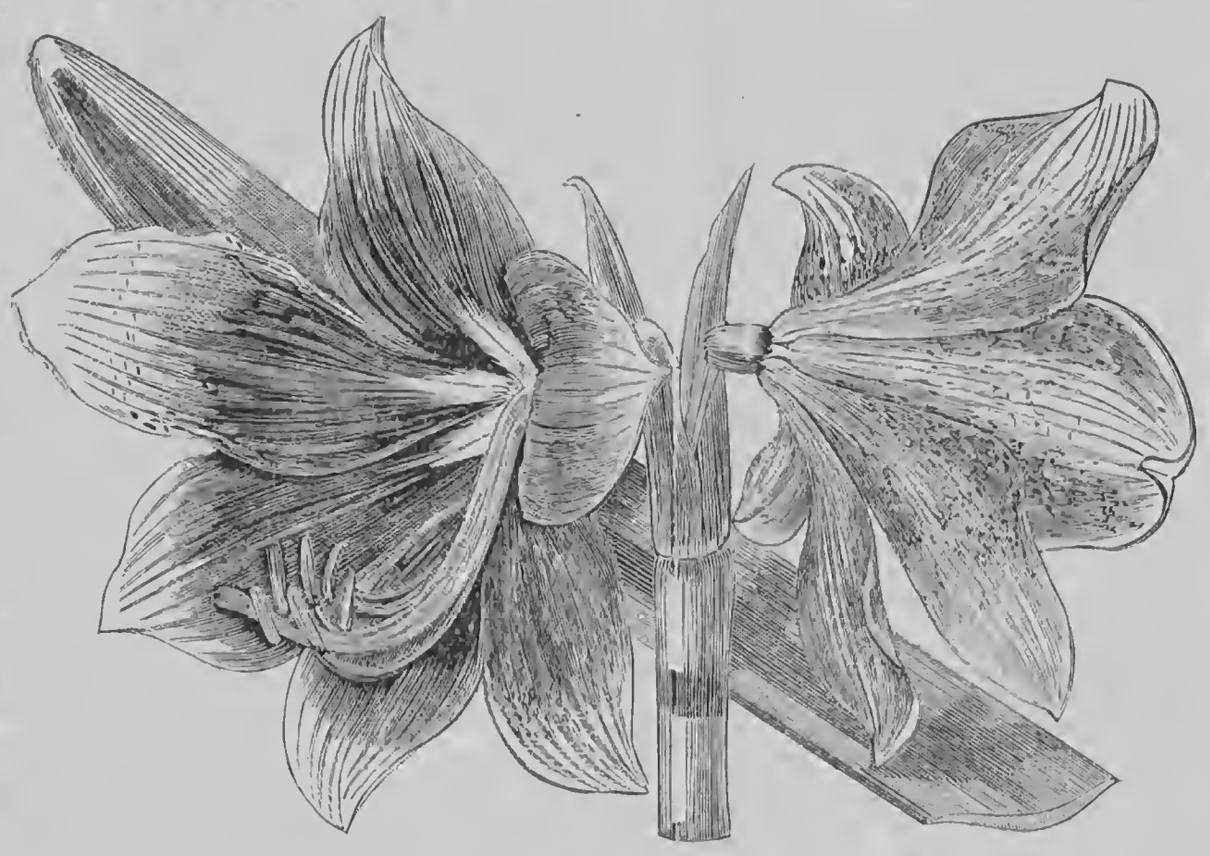
Carbonic acid is one of the most active of the agents employed in bringing the insoluble organic matter in the soil into that physical condition in which it becomes available as plant-food. In order that this acid may be formed, it is essential that the carbonaceous matter in the soil should be brought into direct contact with the atmosphere, from which they procure the oxygen necessary to convert them into carbonic acid. So long as stagnant water remains in the soil, or so long as the soil is in a dense or very compact condition, it is impossible for the carbon to be converted into acid.—*Journal of Chemistry.*

Floricultural.

AMARYLLIS HENDERSONI COCCINEA.

This Amaryllis is one of many raised by Mr. E. G. Henderson of London, from seed, and is an instance of the improvement made in this fine genus by seedling cultivation and crossing. It is of a scarlet color, each petal tipped with white and dotted with crimson. Its funnel-shaped flowers have a greenish star in the center and are from 6 to 9 inches in diameter.

Many of the Amaryllis are beyond question among the most showy of greenhouse flowers, and would be more esteemed even than the Lily, were they as hardy. Exceptions, however, may be found in *A. Johnsoni*, *A. belladonna* and its many varieties, *A. Valotta purpurea*, *A. vittata*, *A. Longiflora* and *A. formosissima* which are adapted either to the sitting-room or out-door cultivation. Those of our readers who have never seen *A. formosissima* (the Jacobean Lily) would be pleased if they procured it. The form of the flower is strikingly graceful—its glossy, soft dark-crimson color is superb. Blooming bulbs may be purchased of any seedsman for twenty-five cents each. They should be planted in the garden about June 1st, in light soil with the neck above ground. The scape appears before the narrow strap-shaped leaves are much developed and large bulbs will bear two, sometimes three flowers in succession. The greenhouse varieties of the Amaryllis after blooming, may be removed from the pots and preserved the same as a Tuberose bulb—though it is preferred to leave them in pots placed out of the way in a temperature between 40 and 50 degs. and to give them the needed repose by withholding water. In this way we may choose our own period for bringing them into bloom.



AMARYLLIS HENDERSONI COCCINEA.

When seeds are desired, it is well to assure the fertilization of the pistil by artificial application of pollen, and to keep them in heat and moisture until the flowers have withered and the seeds matured. They may be sown at once and blooming bulbs produced in from two to four years, according to circumstances.

Entomological.

A RAID ON NOXIOUS INSECTS.

At last a bill has been introduced into Congress, asking that a commission be appointed composed of scientific entomologists to make investigations in regard to several of our most destructive kinds of insects.

In fact two bills have been introduced, one asking for a commission whose duty it shall be to visit the Rocky Mountains for the purpose of ascertaining the exact location and extent of the breeding places of the Locusts, and endeavor to discover some method of destroying this pest in its native habitats. The other is introduced by Senator Ingalls of Kansas, and looks to the investigation of other species of insects besides the locusts, and in our opinion, it is altogether preferable to the former. The bill as introduced makes the following provisions:

"That the Secretary of the Interior shall have authority to appoint a Board of Commissioners, and to fill all vacancies which may occur therein, on the nomination of the National Academy of Sciences, to consist of three entomologists eminent in their profession.

"The said Commissioners shall devote themselves to the investigation of those insects which are most destructive to the crops of farmers and planters, and especially of the Rocky Mountain Locust, the Chinch Bug, the Army worm, the Cotton worm, the Hessian fly and other insects injurious to the great staples, corn, wheat and cotton; in order to devise successful methods for the destruction of such insects. The commissioners shall report the results of such investigations and methods, at least once in each year, to the Secretary of the Interior, by whom the same shall be transmitted to Congress. As soon, also, as the information gathered shall enable them, the commissioners shall compile practical instructions for the repression of the different insects referred to.

"The said Commissioners shall be appointed for the term of five years, and vacancies shall be filled for the residue of the term only, and they shall respectively receive five thousand dollars per annum, to be paid monthly from the date of original appointment, and shall have clerical assistance, office-room, fuel, stationery, chemicals and traveling expenses, not to exceed ten thousand dollars per annum."

The only objection we have to the above is the limited number of entomologists proposed, for no three men, however capable or industrious can spread themselves over the vast extent of territory infested with the insects named. Still we shall be pleased to see the bill passed as it is, for it will be an entering wedge that may eventually open the eyes of congressmen and the masses generally, to the fact, that entomology is not altogether an ornamental branch of natural science.

Of course this bill will meet much opposition, both inside and outside of Congress, from men who are utterly ignorant of the subject, and care nothing for the personal interest of the thousands of farmers who sustain the losses caused by insect depredators. It will doubtless be urged that the said commission will cost the country a few thousands of dollars annually, but what an insignificant trifle is twenty-five or even fifty thousand dollars in comparison with the two to four hundred millions destroyed by noxious insects. Some of our cotemporaries have already begun to ask. "How are these bug hunters going to control these insects?" This is just what the proposed commission is to find out, for did we know that much, it would not be needed.

We hope every farmer as well as friend of the agriculturists of this country will use his influence to have some such bill as proposed passed, even if some few hundred supernumeraries and leeches which are now sucking public pap, have to be cut off in order to supply the funds for the support of the commission.

PREVENTIVE OF BORERS.

As the season approaches when borers commence their ravages on fruit trees and the deposit of the eggs has to be guarded against, information on this subject will be in order. As one important precaution, we would advise against planting shade trees, as mountain ash, near where apple and pear trees are to grow. The borers breed in mountain ash, worse even than in apple trees, possibly because the shade trees are less carefully attended to. A writer in the Prairie Farmer has been experimenting with kerosene, which, though hazardous, seems to have been attended with good results. He says:

"The borers have been troubling us here for several years, more particularly near Chicago, where the maples have been destroyed in great quantities. It remained for the year 1874 to show us their destructive power. You remember that year was the hottest and dryest on record. The borers then made terrible havoc with our trees. All the mountain ash were destroyed, about four-fifths of the soft maples, two-thirds of the elms, and one-half of the ash-leaved maples. The true ashes, willows and poplars were not attacked. A great many trees were killed by the dry weather. I think not a single tree of the kind they attacked escaped without more or less injury. We came to the conclusion something must be done to destroy or counteract the borer, or that we must stop planting trees.

"We found that in this section the mass of eggs were laid from the last week of May to the first week of July (inclusive), on the south and southwest side of the tree, seldom on the east and never on the north side. A shaded tree they do not attack, unless it is dying or dead. To shade all our trees was impossible. Soap, if properly applied, we found would keep them out, but would not destroy them once they had obtained a lodgment; we found also that a fresh application had to be made after each hard rain to be effectual.

"Being told that an application of kerosene would be effectual, we determined to try it, but as no one appeared to be thoroughly posted as to its effects upon the trees, some affirming that it would kill, while others thought not, we concluded first to test it with two soft maples, just at the time the leaves were starting. We cut the bark of one of these in several places, the other we left entire. We saturated them with kerosene on the south and southwest sides. During the first week the kerosene was distinct to taste and smell; during the second week a slight trace only could be perceived, which entirely disappeared the third week. The buds which were touched by the kerosene were killed, but new buds pushed out and grew vigorously, and the trees grew as well as others in the nursery. We applied kerosene the middle of June to over four thousand trees, with apparently good results. The trees grew well and have commenced healing wherever previously attacked. There was no sign of a borer on trees washed with the kerosene; even where the trees were dead, the bark was stripped off and no sign of the borer seen. We shall continue the experiment this year (1876), and note the result. A number of trees were planted on the north and east side of a board fence, and some directly opposite on the south and west side; those on the south and west side were attacked in proportion to those on the north and east side as three to one, yet the only difference was the partial shade afforded those on the north and east.

"Notwithstanding the foregoing facts, I would not recommend the indiscriminate use of kerosene until the experiment has been more thoroughly tried."

A safer preventive, and effectual if applied before the eggs are laid, is to wash the trunks of trees, liable to be infected, with carbolic acid diluted with water. This does no injury to the tree, but it will not avail where the eggs are already deposited. It is very doubtful whether even kerosene will destroy the egg that is to hatch out the borer unless the bark is removed sufficiently to bring the oil in contact with the egg.

Rough bark should be scraped from trees in cold or wet weather to destroy insects. A little wet will often destroy what intense cold has left uninjured.

Pisciculture.

GROWTH OF BROOK TROUT.

Considerable discussion has been provoked lately, in the New York City papers, regarding the limit of the growth of brook trout (*Salmo fontinalis*), one having recently been brought to that city from Androscoggin river, in Maine, weighing ten pouds. An experienced guide at Moosehead Lake has laid it down as a law of nature that no real trout ever weighed more than five pounds, and unhesitatingly affirms that whenever one of greater weight is reported, either the fish is not a brook trout or the fisherman is a falsifier. This story of one of double the possible weight, and coming, too, from his own State, would drive the guide at once to his second alternative.

Mr. Thomas Sedgwick Steele of Hartford, Conn., who has of late turned his attention in leisure hours to trout painting, has among his studies drawings of brook trout from five to ten pounds in weight, with the date and place of their capture, as well as the name of the fortunate angler who landed them; and their varied proportions make an interesting study.

In the case of most of the fish the weight is well distributed throughout their entire length; but in the outlines of an 8½ pounder we noticed the bulk was thrown forward of the dorsal fin, while the tracing of a ten-pounder puts one in mind of a sunfish, being seemingly almost as broad as it was long. These fish are all from the Rangely region in Maine, but in attempting to give the size of these monster brook trout, one immediately places his veracity on trial. But for the sake of this noblest member of the *Salmo* family, one ought to run some risk of criticism. Professor Agassiz is authority for the statement that "no other waters in the world produce such large brook trout as these pure cold streams in the wilderness of Maine," and they grow very rapidly in the first few years of their lives, but, of course, like man, do not continue in the same ratio.

Many of them have been liberated after capture, with weight and year stamped on a platina tag inserted in the dorsal fin, and Thomas Moran, the artist of the Yellowstone, captured a 2¼ pound fish with one of these tags attached, stamped 1871, showing that the trout had increased one pound and three-quarters in two years.

At the headquarters of the "Oquossoc Angling Association," on the Rangeley river, a place of annual resort by Mr. Steele, and where he captured a six-pounder in June, 1873, there is a book in which a record of all large trout is kept, with dates, place and weight affixed, so that any time one can turn over its pages and note the heroes of the Association. This book dates as far back as 1869, at which time, if we mistake not, the Association was organized. Here on one page is an exact account of the numbers and weights of thirty brook trout taken by eight gentlemen visiting this locality at that time, the average time of fishing about six days each. In this list none are mentioned under four pounds each, although a large quantity of smaller ones were taken:

3	Brook	Trout	4	pounds	each.
1	"	"	4¼	"	"
1	"	"	4½	"	"
2	"	"	4¾	"	"
3	"	"	5	"	"
1	"	"	5¼	"	"
4	"	"	5½	"	"
2	"	"	6	"	"
2	"	"	6¼	"	"
2	"	"	6¾	"	"
2	"	"	7	"	"
1	"	"	7¼	"	"
1	"	"	7¾	"	"
3	"	"	8	"	"
1	"	"	8½	"	"
1	"	"	9	"	"

Making thirty trout, total weight, 181¼ pounds, or averaging over six pounds each.

Here is another account of a gentleman taking in three-quarters of an hour 24½ pounds of trout. That individual's time must have been spent very satisfactorily!

Mr. Page, President of the Association, some seasons ago, took with a fly, on the Rangeley river, a brook trout, weighing ten pounds, and if the reader has any doubts of this statement, the next time he is in New York, if he will call on Mr. Page, at No. 10 Warren St., (second floor), he will be permitted to examine the fish now at rest under a glass shade.

A party, in the spring of 1874, took in two weeks, 175 trout, weighing 232 pounds, and among the lot were fish which turned the scales at three, four, five, six, six and a-half and eight pounds.

In July last, in this same region, a gentleman landed four in one day, that averaged over five pounds each; and, during one week's fishing, there were captured two of seven and a-half pounds, and three of six pounds each; while a novice to the sport was made happy by a string of twenty-four, which weighed seventy-five pounds. The past season was the best in five years, the trout not being so plenty, but of larger growth.

Large trout, weighing from six to ten pounds, will average from twenty-three to thirty inches in length, and the width of the tail is from five to eight inches.

They have all the beautiful spots, tints and recognized peculiarities of brook trout, such as square tails, small heads, the inside of the mouth black (instead of white, like lake trout), and are, no doubt, the genuine *Salmo fontinalis*, as lake trout are not known in that locality. Some epicure will ask regarding the taste of these large trout in comparison with those under a pound in weight. But there is little difference, that little being in favor of small trout.

A number of these large trout are now frozen, preparatory to their exhibition at the coming Centennial, and they certainly have every right to be there, as it is estimated that the ages of two of the largest combined would make a hundred years. These trout are often very quiet and sulky, soon after they strike the hook, and one is often deceived by thinking he has fastened to a log, but when once they move they carry all before them.

The facts certainly prove beyond all question the statement regarding the extraordinary growth of speckled brook trout: still it's considerable satisfaction to know that there is a limit, and that we are not annoyed by those of the size of whales or sea-serpents.—*Hartford Times.*

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

CHOICE OF COMPANIONS.

March 6.—Every person probably has a choice in the selection of companions and associates, and there is such a wide field and endless variety that it is one's own fault if he, or she, is not suited. There are the good, better, best, and the bad, indifferent and worthless of both sexes, from which to choose, also the jovial and jolly, social and unsocial, those from whom we can always learn something which is useful and instructive, besides some of an opposite character, whose minds, like the fly leaf of a book, appear to have been missed and left blank by the types, with not a spot on the page, either for good or evil. There are, however, persons who go through life seeking companionship, though never finding it, they doubtless thinking it is the world's fault and not theirs.

We have all met such people, and in various places, and at various times, for they are not rare, either in city or country, among both the rich and poor, consequently neither photograph nor minute description is required to assist in recognizing them wherever or whenever found. The city with all its millions of attractions is to such persons a stupid "bore," the country a lonesome, dreary waste, in which there is neither life nor beauty, and they wonder how people can endure such solitude and not become insane or die through lack of something to excite the mental faculties sufficiently to enable them to live.

I am frequently reminded of the dreariness of country life by my city friends, although it never occurs to me except when asked, "How can you endure the country?" or, "What do you find to amuse you during the long, dreary winter, away from the many amusements to be found in the city?" These and hundreds of other questions are thought of, if not asked, by city people in regard to the pastimes and mode of living of their country cousins, but they either forget or overlook the fact that a person may be surrounded by the most agreeable companions when apparently all alone.

While I am at this moment shut up in my library with no human being for a companion, I am not alone, for arranged about me upon shelves are the works of thousands of some of the greatest men that ever lived. If I desire to converse with them, there they stand ready to give me their best thoughts—not the crude ramblings of some caller who desires to fill up the time and make himself agreeable whether he is able to do so or no. If I feel like talking of natural history, farming or horticulture, I can ask PLINY to tell me what of his time, twenty centuries ago, and after he has told his story he can be "shut up" without taking offence at the sudden termination of the conversation. Then Messrs. VIRGIL, THEOPHRASTUS, COLUMELLA, and other very old and somewhat antiquated, but rather interesting, gentlemen can be asked to step forward and tell what they know of any particular subject which may be under consideration and in their line of study. From these grand old fellow-laborers in natural history, of two thousand years ago, we may come along down to LINNÉ, FABRICIUS, BUFFON, SWAMMERDAM, HUMBOLDT, AGASSIZ, and even to men now living, and here they are all about me with their grandest words and best thoughts at my disposal. Who will say that these are not agreeable and entertaining companions? Yes, companions to whom royalty was in many instances proud to do homage and bestow favors.

Then, in addition to all these old and long-tried friends and companions, there come our daily, weekly and monthly visitors—neat, trim and in fashionable apparel,—affording one an abundant opportunity for the selection of friends and companions, and what is more, we can give them the "cold shoulder" or a hearty welcome, and it's nobody's business but our own. If we tire of these companions and desire a change, the very air is full of life. Even now as I write, this a bluebird is swinging upon a twig of an old oak near the window, trilling a soft, sweet song, such as a JENNY LIND or a CLARA LOUISE KELLOGG might vainly attempt to imitate, while a flock of blackbirds occupy an entire tree-top not far away, pouring forth a flood of music as rich and varied as ever came from the brain of a MOZART or a BEETHOVEN.

Is there not here an opportunity for making a choice of companions? Who will say that country life must necessarily be a dreary one, no matter how isolated from society or kindred? With books, birds, flowers, and animate and inanimate nature surrounding us, the life of every human being ought to be made full to overflowing, and it's no fault of Nature if it is not so.

PRUNING PLANTS IN SPRING.

March 7.—Although there is yet some frost in the ground, the warm south breeze and cloudless sky invite me out into the garden, where, with pruning knife in hand, I find something to do. The old currant bushes have thrown up so many thrifty shoots from the central stem that a portion must be removed in order to let in air and light to ripen the fruit and keep the bearing wood healthy and vigorous. In pruning the ordinary sorts it is well to cut out the weak young canes as well as to remove the old ones which have been in bearing for two or three years. Currant bushes generally become crowded with too many canes, for producing large fruit, and thinning-out becomes necessary from time to time. The same is true of gooseberries, and the knife and shears must be used freely if health of plant and good annual crops are to be kept up for any considerable length of time.

With raspberries less pruning is necessary, but the canes of the black varieties should be cut back in spring, if long and slender, as this will force out strong, lateral bearing branches, yielding far larger berries than if no pruning is done. The best of our cultivated sorts of berries, if given no culture and the plants not pruned, would yield very little, if any, better fruit than that obtained from plants in the woods and neglected fields. By pruning domesticated plants we reduce the number of specimens of fruit or flowers, but make up for it in size and quality, hence one of the results of scientific horticulture.

In passing among the apple, pear, cherry and other kinds of fruit trees, it is always well to have a sharp knife in one's pocket, even if the visit to the orchard is not intended for the purpose of pruning. A crowded or overlapping branch may have been overlooked, and needs to be removed, and there is seldom a better time to do this than when it is first discovered. Other branches may be taking the lead of their neighbors, either at the top or on one side, and these should be headed back, in order to give a uniform, symmetrical shape to the head of the tree. Attention to such small matters may in the end save much labor, and give a neat appearance to an orchard.

Among shrubbery I can usually find use for the knife in removing old, feeble stems and branches, and shortening the new, because it is seldom that shrubs will grow just to our liking without some little attention. The *Weigelas*, *Syringas*, bush honeysuckles and similar shrubs, if planted on rich soil, are likely to produce a greater number of slender canes than are required to give a shapely, handsome plant, and a little pruning now and then is required to make perfect what would otherwise be imperfect.

All kinds of hardy roses need the same attention as the ordinary shrubs. Old canes which have bloomed for one, two or more years, may be removed, thereby forcing the sap into the younger and more vigorous, which will give larger and more perfect blooms. There is always more or less of this kind of work to be done where one has an orchard and garden to be cared for, but it need not be considered an irksome, laborious task, but a pleasant pastime when one is off duty in other occupations.

Arboricultural.

TRANSPLANTING.

As the time of transplanting draws near, we wish to offer a few words upon this subject, which, however well understood in theory, is yet in practice so far disregarded that many people, to accomplish the operation speedily, prefer rather to "trust to chances" than by a careful observance of glaringly-important steps to secure almost beyond a doubt the health and vigor of the transplanted trees or shrubs. If it is worth one's while to ponder over catalogues, make many inquiries, select and purchase a tree,

It is certainly worth one's while to provide those easy conditions which will render it valuable to us after it is planted. Is it not silly for a man, after purchasing the finest of lines, hooks, etc., to go fishing without bait? It is true, in trusting to chances, it *might* occur that the fish would be found ravenous enough to bite at unbaited hooks. But the greatest expense and trouble having been incurred, it is safest not to permit a little extra trouble to stand in the way of an avoidance of the worst phase of "fisherman's luck." In trusting to chances in transplanting trees, it *may* happen that the trees will be received from the nursery without a broken fiber or a blemish; it *may* happen that the natural earth is that best adapted to those trees:—that the day will prove cloudy and the subsequent weather favorable. It *may* occur, in short, that the trees will greedily accept whatever is presented to them—but, as we have already incurred the greatest expense, it is the least wise to neglect several details, the observance of which will facilitate in so high a degree the safety and welfare of the plant.

The preservation of fibrous roots intact is that upon which the success of transplanting almost wholly depends. There would be no occasion whatever to consider the best times for transplanting, if trees could be removed without the slightest injury to their fibrous roots—and midsummer would answer just as well as fall or spring. In the proportion that injury is done to the fibrous roots, the vigor or life of the plant is weakened or endangered. (1.)

All parts of the roots are concerned in the procurement of water and the gases dissolved in it—but it is the new and thin-celled parts and fibrils which absorb most freely. In spring the buds which were formed during the last season's growth, are ready to break forth as soon as the ground is thawed and frosts cease. Every stem, branch, branchlet and bud commence their work. Exhalation begins. Vacuums are formed which induce the flow of sap from subjacent cells—and these from cells still beneath, until the roots are called into action and the tree is fairly at work. The flame of a kerosene lamp may be compared to the warmth and air which cause the evaporation from the surface of trees. The wick may be considered the stem and roots through which the sap is forced upward by the pressure of the atmosphere to refill the cells which by the flame in one case, and by heat and air in the other, have been made empty. As evaporation from the leaves, etc., becomes rapid, the roots are called upon to act with corresponding activity to supply the loss, and so long as the demand and supply are equal, the healthy functions of the plant are executed. The crude sap is inspissated and, combined with the carbon of the air, is ready to feed new buds, leaves and wood, according to the plant's nature. The power of the leaves and stems to exhale depends upon the power of the fibrous roots to absorb—and upon this co-operation the life of the plant depends. If the earth in which the plant grows becomes somewhat dry, the pores (stomata) of the leaves contract so as to check the drain which the roots can no longer supply. But perspiration continues, though lessened to adapt itself to this decreased supply as far as the mechanism of the plant enables it so to do. If now the earth become more dry, the roots labor in vain to perform their office—the dependent co-operative leaves, no longer supplied with material out of which to provide the plant's food, droop and, unless relief speedily come, wither and die, as a last service to the plant which bore them—since, with the same structure, they could only have survived upon the vital tissues of the plant itself. The plant, having thus parted with those members which—of the first importance in health, are the first to be sacrificed in debility—as the sick human patient is constrained to relinquish the food and exercise of a vigorous state—may still live until rain once more invigorates the enfeebled roots and fresh leaves are developed for estore its wonted equilibrium. (2). This disleafing is one of Nature's remedies—an adaptation of outgo to income—a curtailment of extended parts to a frailer foundation—and it offers, as it seems to us, a very plausible reason why, in transplanting, the branches of trees, shrubs or perennial plants of any description, should be pruned so as to re-establish, as nearly as may be, the normal relationship between the aerial and subterranean systems. (3).

There are few rural people that do not know the importance of cherishing every fibrous root during the operation of transplanting—but we have seen them—not unfrequently either—act as if they knew nothing about it. Bundles of trees and shrubs are received from the nurseries, the bagging and straw torn off and the roots exposed to air and sun until the last is planted—in which case "the last shall 'not' be first" only to die. Evaporation goes on in a greatly increasing ratio with the violence of the wind—a great deal of heat is thus rendered latent and cold is produced upon the evaporating surface. Hence *ether* produces cold in the hand by its quick evaporation. Hence, in order to hasten evaporation, we "blow" our tea and coffee—at least those of us who are lawless enough to do so. A high wind, with the thermometer 10 above, seems colder than a still air with 10 below zero. The atmosphere of warmth that radiates from all bodies is every instant dissipated by wind, and its place is every instant filled with fresh, cold air. Hence it is that water perfectly quiet has been cooled to 15 without solidifying—while if agitated it freezes at once and the thermometer will register 32. And thus it is that the fibers of roots—the minute, growing points—most serviceable in absorption, when exposed to sun and wind, are dried to death in a few moments and the functions of the plant crippled accordingly. Many catalogues recommend in their "Hints to Planters" to shake a tree up and down while setting it—a very simple and efficacious method of destroying these tender threads. The earth presses hard upon them, and a sudden jerk upward must wound and break, while the downward movement must still further bend and entangle them. If necessary to transplant during windy or sunny days, protect the roots *every moment* and keep them moist without an interval until the last one is placed in the ground. Shelter them even while they are being carried to the prepared hole. If the weather is not moist, choose early morning for planting—because as the plants do not perspire during darkness, while the roots continue to absorb, they are then provided with the greatest store of sap. If the ground is in the least inclined to dryness, flood the holes with tepid water—puddle to within a few inches of the top, stake the tree, even if small, and finally cover the ground with grass, moss, sawdust, straw or hay, which will retain the moisture and go far toward establishing that equilibrium between the roots and the branches, buds and leaves most conducive to a healthy development and growth.

We need not here refer to the advisability of digging large, deep holes—of providing a sufficiency of good soil, etc. All these are desirable if we would look to the ultimate tree: if we would have ornamental trees develop their finest forms, and fruit trees their finest fruits. But they are not otherwise indispensable. We only wish to impress upon our readers the degree of importance which should attach to a preservation of the fibrous roots.

(1.) We were obliged to transplant a five-year-old cherry tree in the middle of August. We endeavored to hold a ball of earth about the roots, but it fell off as the tree was raised from its hole. Having been transplanted the year previously, the fibers were in no way injured, so that, placed in its new hole and watered every other day for two weeks, not a leaf was lost.

(2.) In the Tropics, the leaves perform their work during the wet season and, becoming clogged with insoluble matter deposited in their tissues, fall, being of no further service, upon the advent of the dry period, when their presence would only exhaust the plant by exhalations which the roots could not replace.

(3.) So, on the other hand, if plants grow in moist, stagnant grounds or incessant rains and a saturated air supply water which the plant cannot throw off, the sap is stagnated—decomposition and appropriation cannot take place; the roots are rotted and dissolved in corrupting acid formations—the tree is surfeited and disease succeeds to the watery, pulpy growth. It follows that if trees at the time of transplantation have attained to any considerable size, they may be as much injured by being cut back too much as too little, because the scanty elaborating material would prove insufficient for the support of the stem and roots, which have been developed to their present size by a greater extent of leaf-surface.

FERTILIZERS FOR FRUIT.

THE Scientific Farmer answers the following questions from a correspondent, which may be of interest to some of our readers:

What are the chemicals necessary to supply fruit trees, apple, pear and cherry, in bearing, to produce crops of fruits? Would young growing trees need more potash than trees in bearing?

There are so many modifying circumstances and conditions connected with and controlling the production of fruit that the question of fertilizers is only one of many. But to answer the question directly we should say, that if the soil produced thrifty growing trees nitrogenous manures should be avoided, since such tend to develop foliage and wood at the expense of fruit. To develop fruit-buds mature wood is necessary. Some slowly decomposing nitrogenous substance in the soil, like horn shavings, leather scraps, etc., would supply necessary nitrogen to the trees without forcing the growth of wood. If the wood waste our subscriber mentioned in his letter is of the same nature as the above, we think, he has just the material at hand. The flesh of fruits contain much potash in combination with the fruity acids, also lime: and the seeds phosphoric acid. Therefore we advise the application each year, per acre, of from 200 to 250 pounds of bone dust, 300 to 400 pounds sulphate of potash, the latter guaranteed to contain 35 to 40 per cent. of sulphate of potash. This would give us 70 to 80 pounds of potash, 50 to 60 pounds of phosphoric acid, and 60 to 70 pounds of lime (from the bones), 10 to 20 pounds of nitrogen, and some magnesia in the potash fertilizer, etc. Such treatment has been found successful by fruit growers in both this country and Europe. We should apply broadcast in the fall to the surface, and leave it to the rains to incorporate with the soil, or at most only harrow the fertilizer in. A ton of dry, unleached wood ashes per acre would furnish nearly the same ingredients. The same amount of mineral phosphates as mentioned of bones would furnish more phosphoric acid, but in a more insoluble condition. Prof. Goessmann is now engaged in experiments upon feeding fruit trees, grapes, etc., and we hope that at no distant day to present some more interesting facts in this connection.

The answer to the second question is apparently from the preceding. Though potash is necessary to the production of fruit, and we apply it for that purpose, yet it is plain that before the tree is mature enough for such production, less potash is required than when in bearing.

Domestic Economy.

A RECIPE BOOK.

And Some Tested Domestic Recipes.

A good way to make a Recipe Book that you can depend upon, is, when you find a recipe that you think is good, try it, and if satisfactory copy it, and send to some paper for publication. Then cut out and paste neatly in a blank book. This gives you a nice book with tested recipes in a more compact form than if written in the book. It also makes them known to others and much benefit is derived from exchanging information, and the best vehicle for accomplishing it is the press. In accordance with this idea I send the well-tested recipes:

White Mountain Cake.—One pound of white sugar, one teacup of butter, half a cupful of sweet milk, the whites of ten eggs, half a teaspoonful of soda, one teaspoonful of cream of tartar, three cups of flour. Flavor with vanilla or almond. Bake in jelly cake pans with icing between. Icing for the cake:—One pound of fine white sugar, the whites of three eggs. The flavor of a grated cocoanut is very nice in it.

Almond Cake.—Two cups of sugar, one of butter, two-thirds of a cup of sweet milk, whites of eight eggs, one teaspoon of soda, two of cream of tartar. Cream to place between:—Two-thirds of a cup of milk, one cup of sugar, one egg, one-fourth of a cup of blanched almonds, pounded in a marble mortar.

Peru Custard.—Make a custard with one pint of cream, two eggs, one cup of sugar. Flavor to suit the taste. Place it in a glass dish and lay sliced cake over it. Whip whites of eggs to a froth, stir in pulverized sugar, and spread over the cake; ornament with colored sugar sand. Or, instead of the whites of eggs, stir powdered sugar into quince or apply jelly and spread over the cake.

Snow Cake.—One cup of butter, two of sugar, whites of eight eggs, one cup of sweet milk, one teaspoonful of soda, and two of cream of tartar. Flavor with lemon.

A Nice Pudding.—To one pint of well mashed potatoes, add half a cup of cream, one half cup of sugar, a piece of fresh butter, four eggs, and lemon or orange flower water. Bake and bring it hot to the table.

Caledonian Cream.—The whites of two eggs, two spoonfuls of loaf sugar, two of raspberry jam, two of currant jelly; all to be beaten together until so thick the spoon will stand alone in it.

Sponge Pudding.—Three eggs, the weight of the eggs in butter, sugar and flower. One teaspoonful of cream of tartar, and half a teaspoonful of soda. Is best with wine sauce.

Cocoanut Pudding.—To the grated meat of a cocoanut take six eggs, six large spoonfuls of sugar, half a teacup of butter and a little soda. Line a dish with puff paste and fill with the mixture. Bake in a quick oven.

To Remove Rust from Steel.—Dinner knives some times get rusty and may be brightened by covering with sweet oil; let it stand for forty-eight hours and rub with unslaked lime, or powdered brick. A fine grain red brick, finely powdered, is good for polishing knives. Whiting is an excellent article for cleaning and polishing silver, brittania, tin, etc., when properly used, making it look almost like new. They should first be rubbed with it wet, then polished with dry.

An Excellent Remedy for Sore Mouth is sage tea, sweetened with honey. It is good for chapped lips.

To Prevent the Hands from Chapping use bran when washing instead of soap. A little vinegar or honey rubbed on immediately after is very good.

To Strengthen Vinegar, freeze it and remove the ice from the top. The water alone freezes, and the strength remains.

LORETTA E. K. TURNER.

Chicago Junction, Ohio, 1876.

SELECTED RECIPES.

Good Sausages.—To every forty pounds of meat add thirteen ounces salt, five ounces black pepper, three ounces sage.

Batter Pudding.—One quart sweet rich milk, twelve tablespoonfuls flour, a little salt, eight eggs. Beat the eggs separately, very light, and have the batter perfectly smooth. Bake quickly, and send to the table immediately. Serve with butter sauce.

Ammonia Cakes.—One and a half pounds flour, four eggs, beaten separately, three-quarter pound butter, one pound sugar, one-half ounce ammonia, dissolved in a little cold water, make into a soft dough, roll out, and cut thin. Bake quickly.

Eggs for Breakfast.—Break ten eggs into a tin plate, add one large spoonful butter, some salt and pepper, put the plate on the stove and allow the eggs to cook until the whites are done, then slip the tin plate into a china one, and send hot to the table.

Sponge Cake.—Twelve eggs, the weight of ten in white sugar, the weight of six in flour, the juice of one lemon. Beat the yelks of the eggs with the sugar till very light, add the whites, beaten to a stiff froth; lastly the flour. This makes a large cake.

Silver Cake.—One pound white sugar, three-quarter pound flour, six ounces butter, whites fifteen eggs. Rub butter and sugar together, add eggs, well beaten, then flour, into which put a measure of Horsford's Bread preparation. Flavor with bitter almond.

Old-Fashioned Indian Pudding.—Scald one pint of milk, turn it on to one half-cup of Indian meal; one egg, two-thirds of a cup of molasses; salt and cinnamon to taste. Add one pint of cold milk, and bake about two hours, stirring two or three times while cooking, so as to make it wheyey.

Tea Cake.—One-half pound flour, one-quarter pound butter, one-quarter pound sugar, three eggs, one-half teacup sweet milk. Put into the flour one-half a teaspoonful baking powder. Flavor with vanilla. This baked in jelly cake pans makes three cakes and with jelly between is very nice for tea.

To Remove Moths.—Moths will work in carpets in rooms that are kept warm in the winter as well as in the summer. A sure method of removing the pests is to pour strong alum-water on the floor to the distance of half a yard around the edges before laying the carpets. Then once or twice during the season sprinkle dry salt over the carpet before sweeping. Insects do not like salt, and sufficient adheres to the carpet to prevent their alighting upon it.

To Prevent Flat-irons from Rusting, melt a quarter of an ounce of camphor, and half a pound of fresh hog's lard over a slow fire, take off the scum, and mix as much black lead with the composition as will bring it to the color of iron. Spread this over the articles for which it is intended. Let it lie for twenty-four hours, and then rub it well with a dry linen cloth. Or smear the iron over with melted suet, and dust thereon some pounded unslaked lime from a muslin bag. Cover the irons with baize in a dry place when not in use.

Hygienic Information.

A CURE FOR OBESITY.

There are many persons afflicted with an uncomfortable burden of polysarcia or pinguitude, or, in other words, who have too much fat on their ribs, and would like to reduce the amount of their adipose tissue. Banting's system proves rather too much for the most of them, and they would rather be aldermanic in their proportions than reduce themselves by starvation. Time, in working out the development of nature's resources, has at last brought to light something for the relief of these unfortunates. M. M. Griffith, M. D., of Wyoming, Del., writes to the Baltimore American, stating that an infusion of a species of seaweed, commonly known in Delaware as "gulf-weed," possesses the peculiar property of reducing adipose tissue in the human frame without injuring the stomach. No care need be taken in regard to the amount of the infusion the patient drinks. Dr. Griffith first noticed the effects of it upon a person who had taken it for the cure of a skin disease, and found that it diminished his excessive weight considerably. He then took it himself, taking no other drinks, and in the course of a few weeks his own corpulence had greatly subsided. He then tried it on three stout neighbors, who lost from twelve to thirty pounds within periods ranging from two to three months. Dr. Griffith says great care should be taken in collecting the weed. It acts by the absorption of the adipose tissue, and lessens the secretions from the oily, sudoriferous glands.

COOKING FOR HEALTH.

There is no more important branch of "preventive medicine" than cooking. Bad cooking may cause a dwindling of the race, ruination of the temper, and deterioriation of the morals. Good cooking, on the other hand, is accompanied by national prosperity and domestic bliss. So say the promoters of the national training school of cookery, who are undoubtedly right in the main, and are deserving of all imaginable success. Now, cooking is both an art and a science. For its progress as an art we are not greatly concerned, although our profession would undoubtedly suffer in pocket should fine art cookery go out of fashion. "Elegant" dishes are generally whited sepulchers, and the fore-runners of blue pills and other disagreeable correctives. The bulk of people live in big cities, and if we were asked to name the most predominating characteristic of our urban population, we should say "dyspepsia." Those who spend their days in dark offices, chambers, or consulting rooms, and keeping their noses everlastingly upon their respective grindstones, seldom know that digestion which should wait on appetite. Hitherto their dinners have not been so skillfully prepared as to demand the least possible effort from a jaded stomach; but let us hope that the national disgrace of indigestibility will no longer dim the brightness of our hospitality, and the number of patent medicines which are sold so largely in this country as aids to digestion will undergo a rapid diminution.—*Ex.*

NEURALGIA AMONG WOMEN.

A physician of a London hospital writes to the British Medical Journal:—"There is no recognized reason why of late years neuralgia of the face and scalp should have increased so much in the female sex, as compared with our own. There is no doubt that it is one of the most common of female maladies, one of the most painful and difficult of treatment. It is also a cause of much mental depression, and leads more often to habits of intemperance than any other. This growing prevalence to neuralgia may to some extent be referred to the effects of cold upon the terminal branches of the nerves distributed to the skin; and the reason why men are less subject to it than women may to a great extent be explained by the much greater protection afforded by the mode in which the former cover their heads when they are in the open air. It may be observed that the surface of the head which is actually covered in man is at least three times that which fashion allows to women; indeed, the points of contact between the hat or bonnet and the head in the latter are so irregular as practically to destroy any protection which might otherwise be afforded.

SYMPTOMS OF DIPHTHERIA.

From all parts of the country we hear of the ravages of diphtheria. In some cases whole families have fallen victims to this dread disease. It is important that all persons, especially parents, should understand what are the first symptoms, and the prompt and efficient measures for relief. An attack of diphtheria usually commences with high fever and headache, and in children with nausea and vomiting. There is great prostration. Upon the tonsils and other parts of the throat are seen white, snow-flaky patches. In malignant cases the patches are often yellow or brownish, and a fetid odor is perceived. A good physician should be immediately summoned when these symptoms are noticed. Chlorate of potash gargles and pounded ice are useful until he arrives. Many physicians have found a successful remedy in the use of permanganate of potash in connection with the tincture of belladonna.

LEMONS WHOLESOME.

When people feel the need of an acid, if they would let vinegar alone, and use lemons or apples, they would feel as well satisfied and receive no injury. A suggestion may not come amiss as to a good plan, when lemons are cheap in market, to make good lemon syrup. Press your hand on the lemon, and roll it back and forth briskly on the table to make it squeeze more easily; then press the juice into a bowl or tumbler—never into a tin; strain out all the seeds, as they give a bad taste. Remove all the pulp from the peels and boil in water—a pint for a dozen pulps—to extract the acid. A few minutes boiling is enough; then strain the water with the juice of the lemon, put a pound of white sugar to a pint of the juice; boil ten minutes, bottle it, and your lemonade is ready. Put a tablespoonful or two of this lemon sirup in a glass of water, and you have a cooling, healthful drink.

HYGIENIC NOTES.

Frosted Feet.—To relieve the intense itching of frosted feet, dissolve a lump of alum in a little water, and bathe the part with it, warming it before the fire. One or two applications is sure to give relief.

Cold Feet.—Cold feet are the precursors of consumption. To escape them, warm your feet well in the morning, and covering the sole with a piece of common paper, carefully draw on the sock, and then the boot or shoe.

For Croup.—Take a knife or grater, and grate or shave in small particles about a teaspoonful of alum; mix it with about twice its quantity of sugar, to make it palatable, and administer it as quickly as possible. Its effects will be truly magical, as almost instaneous relief will be afforded.

Bronchitis.—A simple, but oftentimes efficacious remedy, is this. It may afford relief. Syrup of tolu, one ounce; syrup of squills, half an ounce; wine of ipecac, two drachms; paregoric, three drachms; mucilage of gum arabic, one and a half ounces. Mix. Take a teaspoonful three times a day.

Weak Eyes.—Bathe your eyes night and morning in a tolerably strong solution of salt and water. We have known some remarkable cures effected by this simple remedy. After bathing the eyes daily for about a week, intermit a day or two, and then resume the daily bathing, and so on till your eys get strong again.

The Apiarian.

PROBABLE PROFITS IN BEE-KEEPING.

That veteran Apiarian, T. B. Miner, mentions a case which, though suppositious, fairly represents the results of thousands of attempts to realize a fortune from the Apiary in a few years' time. We copy from his letter in the New York Sun.

Mr. Jones commenced bee keeping in 1863. He bought ten stocks in common box hives for $60, and removed them in the winter in a sleigh to his farm and immediately placed them on low stands about eight inches high, with the hives about two feet apart, with a board roof to each to protect them from rains.

In the following June he had nine swarms' issue, which he put into movable comb hives and, as soon as the swarming season was over, he transferred the bees in the old box hives to those with movable combs, and in October he found that a portion of his bees had not honey enough to carry them through the winter.

Here was a dilemma. Mr. Jones had no experiance in feeding bees and he set them to robbing, and before he learned how to stop the stronger from robbing the weaker families, three had been robbed of all their stores and had been mostly killed in the fight, so that they soon deserted their hives. November came, and he began to think how he should winter his bees. He read in his bee paper so many conflicting accounts in regard to "winter management" that he did not know what to do. But at last he concluded to put his bees in his house cellar, which was dry and dark, two important essentials, and left them till April 1, when the weather happened to be very mild, and he removed them to their stands.

On examination he found all the bees dead in four hives and several others much depopulated. The weather also soon changed to bitter cold with high winds all through April, and the result was that he found on May 15 that out of his nineteen families he has but eleven left alive. That season was a good one for swarms, and he found himself in the fall with thirty families and about 200 pounds of honey in small glass boxes, which he sold in New York for 30c. per pound. The next year he increased to 50 families and sold 500 pounds of box honey. But the next year, 1869, the honey season was very bad, and in September he had 70 families, every one of which must be fed to carry them through the winter. This took 700 pounds of coffee A sugar at 11c. per pound, amounting ro $77; but he had no alternative—his bees must be fed or all be lost, and what was still worse, he got no box honey that year. This is one of the occasional drawbacks to which all bee keeeers are subject, and those who cannot stand any reverses often give up the business in disgust when such misfortunes overtake them.

Mr. Jones has never succeeded in having 100 hives of bees in the entire ten years that he has kept them, and now he has only 65 families; and the probability is that he will never go much higher in number, as the increase of the summer generally disappears in winter; and go where you will, you will find that very few bee keepers ever reach 100 hives from a beginning of ten or less. Severe, cold winters, bad honey seasons, robberies, the bee moth, &c., carry them off.

If a man by purchase, or otherwise, can accumulate 500 stocks os bees in a good section of country for bee keeping and can manage from year to year to keep up the full number, he can certainly make considerable money on them. It would be necessary to colonize them a few miles apart—about 100 families in a colony—and employ a man to attend each colony during the swarming season; and from such a number of families the following profit can reasonably be expected four years out of five: 25 lbs. of box honey to each hive, amounting to 12,500 lbs., worth in New York about $3,500. I say nothing about "extracted" honey, sold by the gallon, as I consider that way of getting honey about "played out" as a profitable way of making money on bees.

Neuralgia.—Persons troubled with this distressing complaint will be glad to learn a cure. Two drops of laudanum in a half teaspoonful of warm water and dropped into the ears will give immediate relief.

"PROGRESS AND IMPROVEMENT."

MORE FAITH NEEDED.

The deep disgrace which has fallen upon the country in the ruin of one who has been highly honored and trusted, is having a worse effect than is generally believed. For years rumors of corruption in high places have been heard and have been discredited as the complaints of political opponents against those in power. From this too lethargic condition of the popular conscience we are in danger of going to the other extreme—of losing faith in the principle of self-government—in all our public men, and to a large extent in human nature itself. The tone of sneering contempt for honesty, purity and goodness of every degree which prevails in many journals is far more dangerous than the ruin of a dozen such men as the late Secretary Belknap. Unless we can retain faith in the possibilities of personal integrity the rising generation of young Americans who gain their ideas of public men in this Centennial year of our country's history, will grow up with not a profound but a very shallow and flippant disbelief in anything real except evil and in any other power than the Satanic.

We do not underestimate the evil tendencies which are so prominent and possibly for the time being predominant in public and especially political life. Corruption and bribery may represent, and to some extent fairly, the public life of the times. But behind all this it must not be forgotten that there are forty millions of American citizens embracing the great industrial and producing classes. These are not corrupted. One public man after another may fall into disgrace and oblivion; but the heart of the American people is sound. They have tolerated corruption partly because in the rectitude of their own hearts they would not believe such wickedness possible; but once they see the truth, the sober, honest sense of the country will not fail to rectify their mistake.

In the meantime, let no honest man despair of the country. Our present condition, with wickedness exposed and thrown on the defensive—with the national conscience aroused and quick to seize every suspicion of guilt—is far more healthful than the moral torpor of years agone, when corruption unexposed was sapping the foundation of public morality. We are not in the greatest danger now, when every pen and tongue is quick to expose iniquity and every ear open to receive it. Our danger was when the few who knew the truth told it to deaf ears and were only received with scoffing and derision.

In the history of the Children of Israel there was a time when the whole nation seemed to be lapsed in idolatry and given over to evil ways. Elijah, the prophet of God, ran away and hid himself in a cave despairing of any good, and seeking only personal safety. The whole story is told in the 19th Chapter of 1st Kings; how the words of the Lord came to the prophet, "What doest thou here, Elijah?" And Elijah answered and said, "I have been very jealous for the Lord God of hosts; because the Children of Israel have forsaken thy covenant, thrown down thy altars and slain thy prophets with the sword; and I, even I, only, am left, and they seek my life to take it away." The question was thrice repeated with the same dull, despairing answer. *Then* the word of the Lord came a fourth time, telling the prophet to get up and do the work which the Lord required of him, and adding the comforting assurance that the prophet was *not* alone as he thought himself, but that there were in Israel SEVEN THOUSAND, all the knees of which have not bowed to Baal and all the mouths which have not kissed him. The following chapters tell how the immense army of Benhadad, the Syrian, was put to flight and destroyed by the army of Israel which, by singular coincidence, numbered seven thousand.

If men who deal out unsparing denunciation of our political and social fabric because of recent revelations of corruptions, could go among the thousands of happy homes where the Rural New-Yorker reaches they could well believe that there are not only seven thousand good men and true, but a thousand times seven thousand in our broad country. Looking at the surface, all is black and dismal enough. Looking deeper into the hearts of the masses of the common people, we find a substratum of honesty able to save our country in sorer distress than any it has experienced. The people may be far too slow to believe evil and seek to remedy it, and this we have long thought; but when once awakened to the truth, their voice will be made effectual.

THE STEAM PLOW STILL WANTED.

Though there have been many failures to produce it, we are among those who believe a Steam Plow adapted to this country will ere long be perfected and prove of vast benefit to American Agriculture. And hence we are glad to note that "A Granger" suggests to his brethren, through the Prairie Farmer, whether a part of their wealth and power could not be well employed in an attempt to solve the problem of steam plowing. He says the work requires brains and money, yet he believes it can be accomplished—that inventors lack means and capitalists are afraid to risk their dollars in anything new. And he tersely adds: "If steam plowing is ever started in America, it will be of incalculable value to the country, and we farmers will derive most benefit in every way. Ought we not, therefore, to make some grand, systematic effort to prove the possibility or impossibility of economical steam cultivation, either by offering a handsome reward for the right machine, or by following up and developing some of the ideas that have been proposed in the past forty years? Let us ascertain the cause of the failures of steam plowing in the past, and see if the defect cannot be remedied. There may be inventions in existence to-day that are what we want, and their originators not having the means to develop them, it would be a glorious achievement for the united farmers of America to bring to light so great a labor-saving machine as a successful steam plow, and the expense to any one man need not exceed a few cents. Will some one earn the gratitude of a nation by carrying out the proposition?"

These suggestions are pertinent and we trust the Patrons—who are especially numerous and powerful in the West and South, where the Steam Plow is most needed—will take some efficient action in the direction indicated. "In union there is strength," and let the truthful adage be applied in this matter—to secure successful and profitable steam plowing on American farms. Among the many promising inventions for this purpose is Redmond's Steam Plow, once illustrated and described in the Rural New-Yorker. We have heard little of it of late, only that its inventor—Mr. Owen Redmond of Rochester, N. Y.,—is still struggling against adverse circumstances, to bring out his plow, and hopes to succeed. He and other worthy workers for a like object need substantial encouragement, and we hope it will be so speedily accorded that at least one practical Steam Plow will be perfected during the Centennial Year.

INCREASED INDUSTRY NECESSARY.

There is one form of inflation of the currency which commends itself to people of every financial theory. We mean, of course, the increase of money in every man's pocketbook, either by careful saving or increased skill and industry in producing salable articles. This last is altogether the better way, as increased production of whatever is useful or beautiful adds to the sum of human happiness. Strange to say, however, the lack of production in our country does not arise so much from laziness as from the fear that valuable articles of any kind will be too largely and rapidly increased. We hear the idea advanced almost daily that we have too much cotton, too much wheat, too much corn, and, in short, too much of everything which produces money, while nearly every individual acknowledges for himself personally a deficiency in that representative of value. Does it not seem probable that some mistake has been made? Are we not wrong in assuming decreased production as a remedy for existing business depression? If not, it will be only fair to exalt laziness into one of the cardinal virtues, and the hordes of tramps who now seek excuse in a false pretense of looking for work may discard the sham and boldly avow their voluntary idleness with the claim that they are the real benefactors of society by helping to restore the equilibrium between consumption and production.

The truth is that what seems an over-production is caused by the poverty of great masses of the people, rendering them unable to use even smaller crops than usual. This has thrown thousands of men and women out of employment, and this enforced idleness has resulted in continued decrease of production, with little prospect of getting out of the rut through present and proposed policies. It certainly will not help matters to still further decrease production. Too little productive industry, combined with extravagance and want of forethought, has brought us where we are. The country will not get out of the slough through pressing forward still deeper into it.

We want a greater variation in our productive industry. Northern farmers' produce is low, but it is because other productive industries are at a standstill and the utmost economy is used in purchasing only articles that are absolutely necessary. The Southern planter complains that cotton is low; but if other branches of productive industry were thriving, the country could take all the present cotton crop at an advance of two or three cents per pound over present rates. What money there is has settled in commercial centers and stays there, doing no good to the mass of the people and very little to its holders. What is needed is, first, the production of salable articles which will tempt this money out of the pockets of holders; and second, though not less important, the restoration of confidence in better times to set this currency moving to all portions of the country.

THE DESTRUCTION OF NOXIOUS INSECTS.

The bill introduced by Senator Ingalls, providing for the appointment of entomologists as commissioners to devise means of destroying noxious insects, was published in the Rural New-Yorker of March 4th, so far as we have heard it meets general approval of farmers and from the agricultural Press. We are glad to know that the measure is also favored by leading entomologists, who, from their knowledge of the habits of noxious insects, best appreciate the necessity for decided and united action in repressing their ravages. In reply to the only criticism which we have anywhere seen of Senator Ingalls' bill, Prof. C. V. Riley writes in the Prairie Farmer of Chicago, earnestly defending the measure and rebuking the petty narrowness which objects to it. We copy the following paragraph:

The good that a competent commission of this kind, adequately supported, is capable of, is incalculable. What it will do, if created, will depend of course on the character of the men composing, and the means at their command—and remains to be seen. The sum to be expended for the work is trifling in view of the object to be accomplished, and the interests at stake. To look at it as a scheme for securing lucrative positions to three men, is a narrow and prejudiced view. It would be well for us if all national appropriations were for a like economic end, and gave the same assurance of usefulness. Congress owes it to the oppressed farmers of the country that some effort be made to relieve them. In part, at least, of so pressing an evil as they labor under from insect depredations. As one who has labored for some time in the field of economic entomology, I heartily indorse the movement; and I view it in the light of national economy and aid to the agricultural population. The salaries which Senator Ingalls bill proposes are not too high. Competent and experienced men cannot be secured without adequate remuneration, and if we are to have a commission of this kind at all, let us not court failure and disappointment by crippling it at the beginning, either by weakening its power for good, or by obliging the appointment of men who would need to fritter the five years away in acquiring the knowledge and experience necessary to carry on the work understandingly and successfully: for those willing to accept small remuneration would very likely be such.

RURAL NOTES AND QUERIES.

Get the Teams, Implements, &c., Ready.—As the busy season approaches, every ruralist should see that his teams are in good heart for the Spring campaign, for much will depend upon their strength, activity and endurance. If they are brought through the cold weather in good condition, fleshy and healthy, your oxen, horses and mules will do good service in prosecuting the varied work in which their aid is indispensable. The farmer who is thus prepared for the season's labors is wise indeed, while he who has weak teams—or bones and hides to sell—is as badly off as were the virgins who had no oil in their lamps on a certain occasion. And don't forget the implements. Every machine, implement or tool should be made ready for use in advance of the time it may be wanted. This will save time—which is money indeed at a busy season—and prevent vexation. Any tools or implements out of order should be repaired in season, so that there be no interruption or delay in performing any needed operation. Put everything in order, therefore, not forgetting that painting is an economical investment in many cases. And if your implements are worn out, or not really labor-saving, or as much so as others of recent invention, get new ones of the latest and best patterns. In these days of improvement in all sorts of farm machinery, it is not economical, but wasteful, to use old, shackly tools, which are liable to break every day, causing detention and expense for repairs.

Valuable Map and Pamphlet Free.—The Atlantic and Pacific Railroad Co. have issued an interesting and valuable pamphlet with sectional maps, showing lands which the Company has for sale in Southwestern Missouri. Besides giving valuable information respecting a railroad enterprise of national importance, this pamphlet contains many interesting and instructive items about a most important country—one which will ere many years, become the garden of the West. The Company offers for sale 1,200,000 acres of land which, as it lies along what will always be one of the highways across the continent, cannot fail to be in the line of good markets and profitable production. The fact that the Company sold last year 133,169 acres, shows the rapidity with which the country is filling up. The pamphlet gives full description of soil, climate, and mineral products as far as developed of these lands, with sectional maps showing each County. The pamphlet is mailed free on sending address to General Land Office, 25 South St., St. Louis, Mo., and is well worth reading by anybody, besides being invaluable to all who think of removing westward.

Moore's Creek Bridge.—The first Centennial celebration of the year was that of the battle of Moore's Creek Bridge in North Carolina, which was fought one hundred years ago, Feb. 27th, 1776. This is claimed to be the first victory won by the American arms in the war of the Revolution. Curiously enough the event has never been celebrated, except once in 1857. Probably, hereafter, this important event in American history will receive the honor to which it is entitled. In the recent celebration, speeches were made by Capt. Samuel A. Ashe of Raleigh, N. C., State Senator Edward W. Kerr, Rev. Mr. Stallings and Judge Edward Cantwell. Patriotic letters were read from U. S. Senator Merriman, Oliver H. Dockery and others.

Iowa Ag. College.—At a recent meeting of the Trustees vacancies in Professorships were filled as follows: Geo. E. Morrow of Chicago (formerly of the Western Farmer and late of the Western Rural), Practical Agriculture; J. E. L. Bral of Boston, Civil Engineering; Thos. E. Pope of Boston, Chemistry. We congratulate the College upon this accession to its faculty. Bro. Morrow was a capital agricultural editor, and is well qualified for the important position to which he has been called. The other gentlemen are spoken of as good selections.

Postal Cards.—The Government loses $700,000 a year by issuing postal cards, that is, the printing and carrying amount to that sum more than the receipts. We never could see why the Government should charge three cents for carrying a letter, while it furnishes and prints a tinted card and carries it any distance for one cent. If postal cards were abolished the postal revenues would be increased two million dollars. Possibly in that event we might have letter postage reduced to two cents, which would be a vast improvement on the abused postal card system.

Tea.—The lady correspondent of the Rural who wishes to know about the culture of tea, is informed that it cannot be grown as far north as New York State, except as a curiosity. The leaves only are used, and hence a crop can be gathered at any age. We do not know where seed can be procured. The seedsmen do not advertise it in their catalogues, though probably any of them would get it if wanted by their customers.

RURAL BREVITIES.

A gentleman in Albion kept a robin in a cage for over twelve years. It has just died.

N. A. Willard of the Rural New-Yorker delivers two addresses before Conventions in the Province of Quebec, March 15 and 16.

The annual report of the packing of Chicago, issued March 10, shows a total summer packing of 728,781 hogs, and a winter packing of 1,592,065 hogs.

$5,000,000 is invested in driving parks in this country and horses amounting to three times that in value are entered for competition in a single year.

The rice growing business upon Cape Fear, N. C., has become nearly extinct. Only 10,000 bushels were raised last year, against an annual product of 200,000 bushels before the war.

The Springfield Union says its faith in Roxbury Russetts as a good keeping apple is confirmed by a couple received lately from W. S. Parker, of South Ashfield, which, though picked in 1874, are still sound and nice.

The Putnam County (N. Y.) Standard says: "An enormous hog, bought by a Watertown butcher a few days since, measured eight feet in length, seven feet around the body, stands three feet four inches high, is two years and nine months old, and pulls the scales down at the enormous weight of 1,750 pounds. It was raised by Mr. Joseph Schnell, near Rossiere."

A young man of this city, who writes "Esq." after his name, tells us what a splendid journal the Rural is—all except one department, which latter he proposes to "conduct *free*, the position being ample remuneration for my (his) services." A generous offer, indeed, but, as the judges say, "decision reserved." We cannot bear too much prosperity all at once, even though this is the Centennial.

Col. Rush C. Hawkins has read a report before the Union League Club of New York upon the cause of the increase of the City Debt, and recommending measures for its more economical government. He thoroughly reviews the doings of the Tweed Ring in all its ramifications, and makes many things plain which were before obscure. He dates the beginning of the robbery back to the Board of Aldermen in 1852, known as the "Forty Thieves" and follows it to the decapitation of all the Court House Ring.

BUSINESS NOTICES.

**Coughs.—A Medicinal Preparation in the form of a *lozenge* is the most convenient. "*Brown's Bronchial Troches*" allay irritation which induces coughing, giving relief in Bronchitis, Hoarseness, Influenza, Consumptive and Asthmatic complaints.

ASK your merchant to furnish you the "**Phœnix Pure White Lead,**" if you would have the best, and take no other.

A SPRING SONG.

BLITHELY breaks the morning
With a warmer beam,
Now, O Earth, awaken
From thy Winter dream!
From some land of beauty,
Where the swallow's wing
Rests on balmiest zephyrs,
Comes the radiant Spring.

Odorous Southern breezes
With her garlands play,
And the sullen snow-clouds
Slowly drift away.
In the woods and valleys
Water softly flows,
And its silvery murmurs
Greet her as she goes.

By the budding hedgerows,
Through the meadows sweet,
Bright-eyed, starry daisies
Springing round her feet,
With the fragrant violets
To her warm lips prest,
And the timid snowdrops
Nestling in her breast.

Many a shrinking flow'ret
From its nook she wiles
With her tears, more precious
Than her sunniest smiles.
Quickly will the forest
Weave a leafy maze,
Ere the sun can seek them
With too ardent gaze.

Haste then, Earth, arouse thee!
Bid thy wild birds sing;
Let them give a welcome
To the gentle Spring!

[*Siecert Wynne.*

The Story-Teller.

FOUND IN THE SNOW.

"HALLOO! This won't do. Move on." The speaker was a gigantic policeman. The object of his wrath was a boy who sat on a low stoop, with his face buried in his hands as if crying.

It was night and snowing fast. A bitter, bitter night, in which one would not wish even one's enemy to be homeless and shelterless. The boy did not stir.

"Halloo, I say!" cried the policeman, angrily, advancing nearer. "No shamming, young 'un. Get up, and move on."

But as the lad, even yet, did not rise, the policeman stooped down and shook him. As he did this the boy fell over, senseless, in the snow.

"Great God!" cried the policeman. "He's dead. Frozen to death, too; perhaps starved. Poor little fellow! An orphan, no doubt. Well, I must take him to the station, I suppose."

But as he lifted the body, which he did tenderly—for he had children of his own at home, the seemingly inanimate form stirred.

"Fainted," said the officer, "but not dead yet. If the station house only wasn't so far off. Ah! maybe they'll take him in here."

As he spoke, a close carriage had dashed up to the next house, a footman sprang from the box, the coach door was flung open, and an old man, wrapped in a fur cloak, stepped out and took the servant's arm, to be helped up the high stoop. Seeing the policeman, however, with the boy in his arms, he stopped abruptly.

"What! what!" he cried. "A young tramp—a beggar? Not dead——"

"No, not dead yet, Mr. Ascot," said the policeman, respectfully, as he recognized the speaker, well known as the wealthiest and most influential householder on his beat, "but I'm afraid will be before I reach the station. And he doesn't seem to be a common sort of beggar boy——"

"Not the common sort, eh? Neither is he," said Mr. Ascot, as he looked at the boy's clothes. "Have him in here—have him in here. John, ring the bell; why the deuce do you stand there gaping—don't you see the boy's dying from cold and hunger? I can walk up the steps well enough alone."

A moment more and Mr. Ascot himself led the way into a warm, spacious drawing-room.

"There's a roaring fire ready," he said. "I always have one waiting for me when I come home from dining out. Where's the housekeeper? Didn't I tell John to bring her at once? Ah! here Mrs Somers comes. Something to revive him, quick! Good heavens! if he should die after all."

"Poor little dear!" said Mrs. Somers, as she poured a restorative down his throat. "There, Jane, give me the blankets while I wrap him up. Ah! he's coming to."

The boy opened his eyes, looked in a far-off way at Mrs. Somers, and then glanced, dreamily, about the room. Evidently his senses had not yet quite come back.

"Mother, mother," he murmured. "I can't find grandfather—and it's so cold. I'm so——"

His head dropped on her shoulder and his eyes closed again. One of his hands, which up to this moment had been tightly shut, opened weakly, and a note fell to the door.

Mrs. Somers did not see the note. Something in the boy's look had startled her. She gave a quick glance up at her master; then she began to tremble all over. Mr. Ascot, who had been standing by her full of interested anxiety, did not observe this look, for his attention had been attracted by the note, which he now stooped to pick up. Then he proceeded to take out his glasses in order to read the superscription.

"Perhaps this may throw some light on the matter," he said. "The poor lad has been sent out on an errand and has fainted from cold, and perhaps hunger. What! what! Good God!" His hands were shaking like leaves in an autumn wind. In the deep stillness the paper rattled with startling noise. "It can't be—it can't be! Mrs. Somers, your eyes are younger than mine—read, read; is that address—is it—mine—Thornton Ascot?"

As he spoke in choked, convulsive gasps, Mrs. Somers leaned forward to read. The motion roused the boy again, and he opened his eyes—this time with more of consciousness in them—and he fixed a long, questioning, puzzled look on Mr. Ascot.

"Merciful heaven!" the latter said, staggering like one struck with palsy, "it is her eyes—her eyes——"

With these words he fell back senseless, the half-open letter fluttering from his fingers to the floor. Fortunately the policeman was in time to catch him, and lay him on the sofa. For a moment the boy was forgotten, every one pressing around the master of the house.

"Is it a stroke?" asked the policeman, anxiously. "What does it mean?"

At any other time Mrs. Somers would have been reticent about family affairs; but she was too flurried to think clearly. Surprised out of herself she took her audience, unconsciously, into her confidence.

"No, it's not a stroke," she answered, with the experience of long years of nursing. "His face isn't awry, you see; and he's only limp, not paralyzed. There, I've opened his cravat; and now, Jane, bring some water. It's but a fainting fit; he often has 'em when he's worried; often, I mean, since his daughter went away. She ran off, you know, 'most ten years ago. He's never forgiven her, or rather she's never—leastway of late years—asked to be forgiven. The last time was when she came herself, just after she was married, on a night as bad as this." All this while Mrs. Somers was busy in trying to revive her master, chafing his hands, holding smelling salts to him, even ordering the window opened. "He turned her from his doors in a perfect rage—I never seed him so angry afore or since. But he's been sorry for it many and many a time, I know. I have heard him sigh so! He was a-thinking of her. He'd have forgiven all, years ago, if she would have come again; but she was as proud as him; I don't know which was the prouder. She went to forrin parts with her husband—he'd been her music teacher, you see—that's what made Mr. Ascot so angry—and she has not been heard of for these years and years. There—he's coming to; what a sigh! Stand aside, Mr. Policeman, please, and give him some air. Poor man! but he's nobody to blame but himself, after all. I don't uphold disobedience in children, of course; but a dearer, sweeter girl than Margaret Ascot never was. Many and many's the time I've carried her in my arms when she was a baby and her mother was alive. How are you feeling now, sir?"

This last sentence was addressed to her master, who, with a deep drawn sigh, opened his eyes.

"What—what is the matter?" he said, looking vacantly from one to the other. "Yes, I remember," putting his hand to his brow, "Margaret——"

His eyes wandering about fell on the boy who, during this episode, had entirely recovered consciousness and was now looking with a strange sort of wonder at Mr. Ascot.

"Please, sir," said the lad, seeing he had attracted the old man's eye, "can you tell me where Mr. Ascot lives? I was to go to him—only I lost my way—mother's very sick—and she's had nothing to eat to-day——"

With these words he broke down with a great sob, the tears streaming along his thin, wan cheeks.

"Where's the note? Order the carriage," said Mr. Ascot, incoherently, rising to his feet. "Is it from Margaret? Did somebody say she was starving?" His poor, weak, shaking hands vainly tried again to unfold the paper which the policeman had handed him. "I—I am not strong as I used to be; I think I am getting old;" and he looked pitcously at Mrs. Somers and sank again on the sofa.

"Drink this," said the housekeeper, handing him a restorative.

He drank it and rallied.

"Ah! it is her—her writing," speaking to himself. "She is a widow, and her only child is named—after—after—me."

He stopped reading and turned to look at the boy.

"Are you grandfather?" said the latter, timidly. "I think you must be, for mother has a picture she looks at and cries over, and it's like you."

The letter fell again to the floor. But this time it was because he opened his arms and the boy, catching the meaning, came to him.

"You won't let her die, will you?" said the boy, looking pitcously into his face.

"Die, die!" cried the old man, rising up; and his voice and air were that of youth. "She shall not die. Where is the carriage? I will go at once and she shall come home to-night. The carriage, I say," he cried, almost angrily, and he turned toward the door, where the footman now appeared.

"The carriage waits, sir," said the servant, obsequiously.

"Get your cloak and bonnet, Mrs. Somers, a few blankets—a bit of food—there's not a minute to lose. Good God! Margaret dying, and we wasting our time here! No, my brave little fellow; your mother shall not die."

In a few minutes, during which the thoughtful Mrs. Somers had provided a biscuit and some hot tea for the boy, the little party set forth. While the carriage is rolling over the snow, its destination being one of the most obscure streets of the great metropolis, let us say a few words about the daughter.

Margaret Ascot had been one of those sweet-tempered, sympathetic natures that everybody loved. Beautiful, accomplished, wealthy and well born, she had crowds of suitors, but at nineteen she turned from them all, and gave her heart to a penniless lover. This was not because she was foolishly romantic, like so many others, but because her suitor was worthy of her in every way except riches. He was only a poor music teacher, an Italian exile—for this was in days now fortunately long ago, before Italy was free, and to be an Italian patriot meant banishment or life-long imprisonment, or even death.

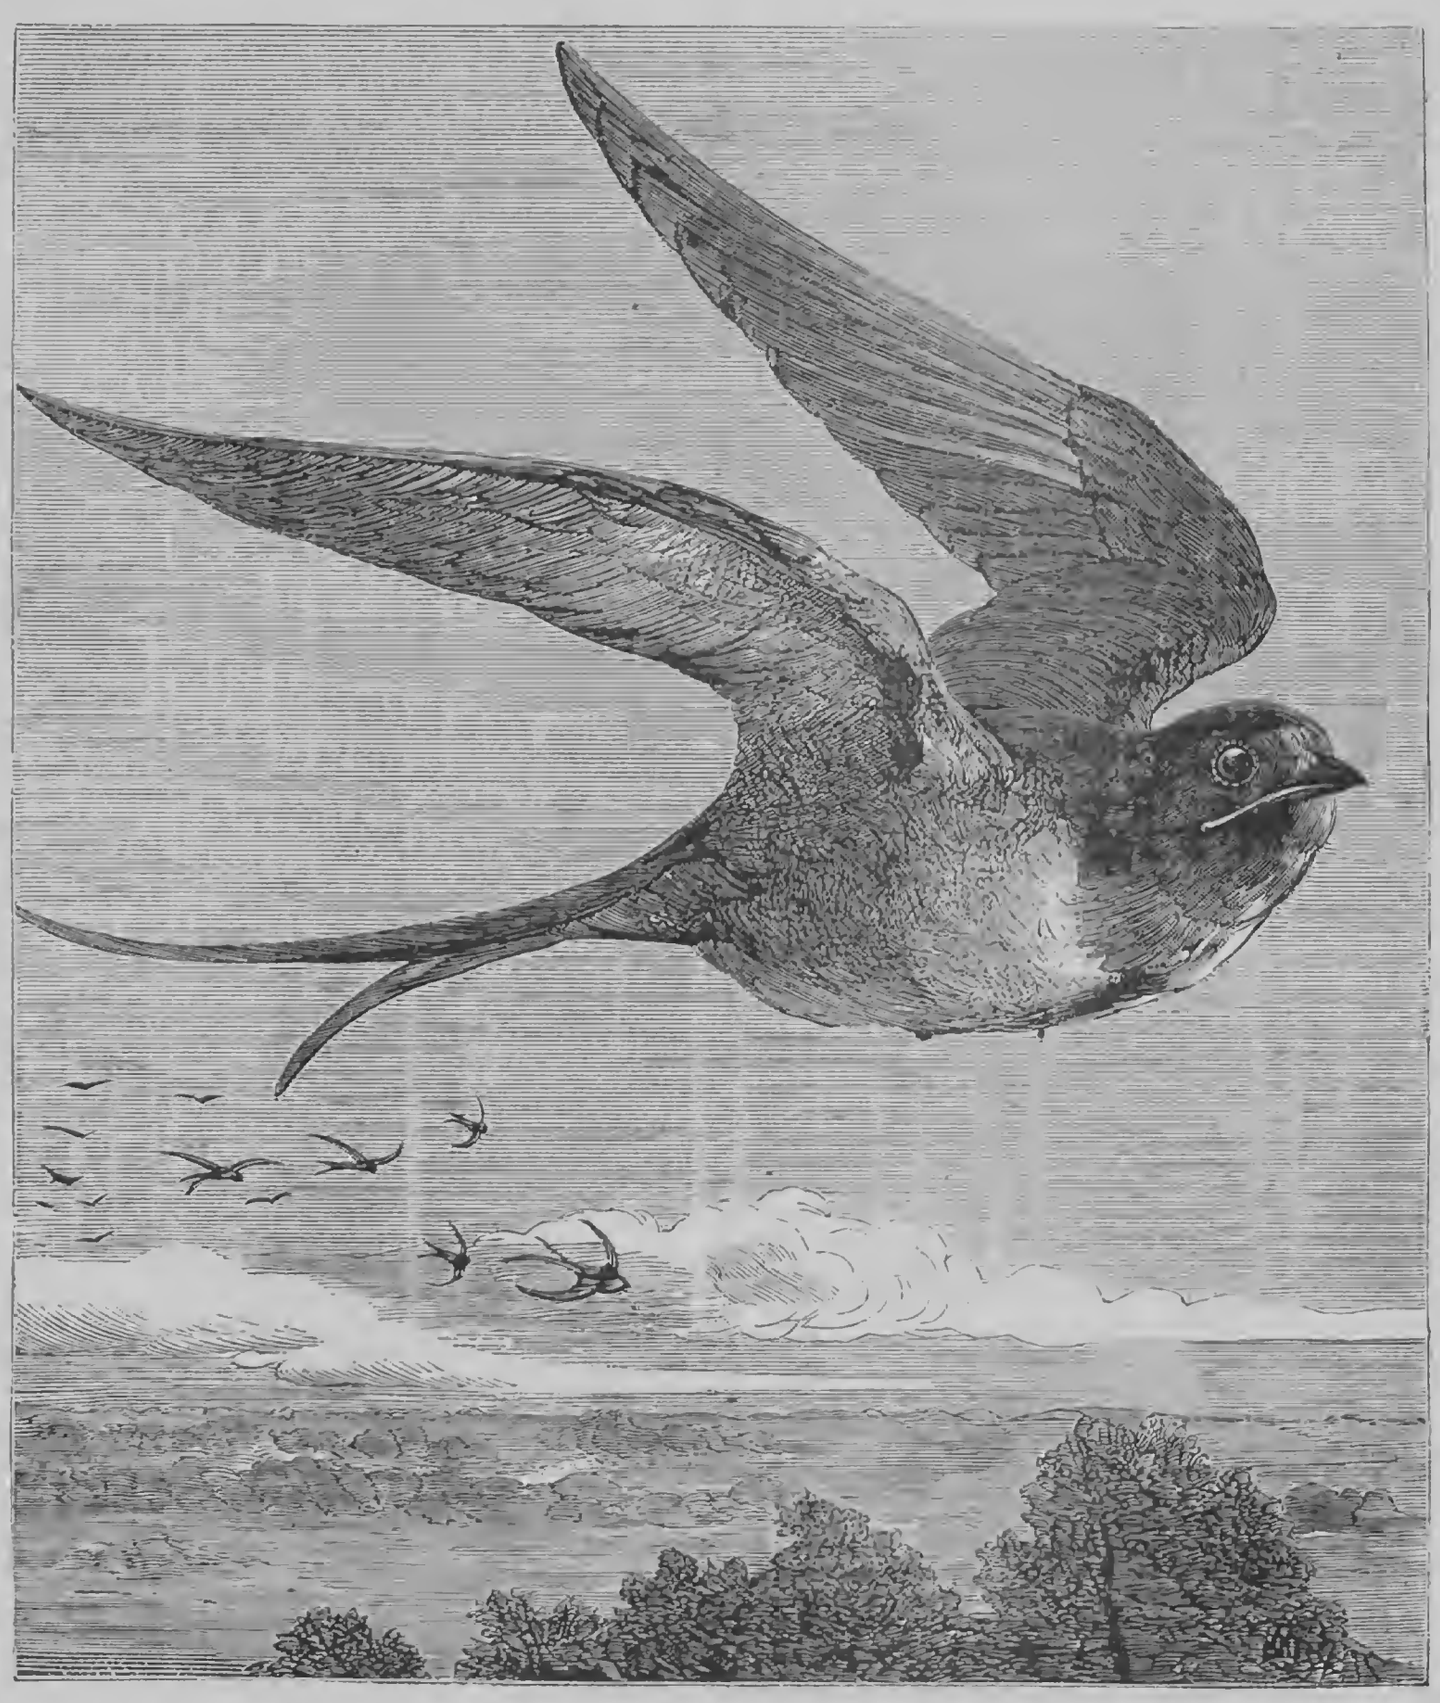
Andrea Filippo had, when hardly more than a boy, joined in the insurrection of '48, and had been compelled after its failure to fly the country. He had come to America and, being penniless, had been compelled to take up the first pursuit that offered itself. In his own land, nearly everybody has some knowledge of music; but Andrea was an amateur of more than ordinary merit, and he naturally became a teacher of singing. Margaret Ascot was his favorite pupil. He saw in her everything that youthful manhood in its highest type admires; she saw in him a hero and a martyr. Compared with the prosaic young men of business or the cold, calculating lawyers, or the idle men of fashion, who constituted the bulk of her admirers, he was a prince in disguise, a young god!

Parents do not sufficiently make allowances for the imaginative element of their daughters. They fancy that at nineteen girls can feed as their mothers do at forty; that the dry husks of a matter-of-fact life are sufficient for them. It is not so, and Mr. Ascot, though a sensible man in other respects, could not understand why his daughter was cold to her wealthy lovers and had given her heart to the exile.

When Margaret, hopeless of altering her father's opinion, finally eloped with her lover, his wrath knew no bounds. He refused to answer her letter announcing the marriage; and when, a few weeks later, she came in person, he had her literally thrust from the door.

After vainly trying to get some other employment—for Mr. Ascot's influence deprived Andrea of all his pupils—the young couple went abroad. For a while they lived in London; but afterwards Andrea returned to Italy and there struggled on until he died. He left his widow penniless; she had only money enough to pay her passage to America, whither she had resolved to come, in hopes by a last appeal to soften her father's heart. It was a winter voyage, and Margaret caught a violent cold, which threatened an inflammation of the lungs. She could only crawl feebly to the nearest lodging on the night she landed—a miserable attic.

The next day Margaret wrote a note to her father, trusting to her boy to deliver it, as she was too ill to go out herself. Knowing that Mr. Ascot would be out during the day, she had deferred sending the lad until toward nightfall; but hardly had he left before she began to think of the perils he ran alone in that great city. Perhaps, she said to herself, he has fallen down



THE FIRST SWALLOW.—(See page 191.)

some open area; perhaps he sank cold and insensible in some bank of snow. When eight o'clock struck from a neighboring steeple, and still her boy did not return, she became almost wild with fright. Ten o'clock came, but still no son. She listened intensely for the sound of his feet, but she heard nothing but the roar of the storm. At last her anxiety and fear rose to frenzy; she was sure her boy was dead. Eleven o'clock struck. Her candle had burned down into the socket and was almost on the point of expiring. Suddenly the sound of carriage wheels, muffled by the snow, was heard; the carriage stopped. Surely that was the opening of the street door; there were steps ascending the stairs. Yes, she could not be mistaken, they were the steps of her boy! The door of her room flew open and her son rushed in.

"Mother, mother!" he cried, flinging his arm eagerly around her, "I came as soon as I could. And oh! mother, I have brought grandfather with me. See!"

She looked past her son, scarcely believing her own eyes. There, just behind her boy, stood her father. She rose up in bed; she held out her arms.

"Father!" she sobbed.

"Margaret, my child!" And then they were locked in each other's arms and both were in tears.

"I can die in peace now," she murmured, after a while, as she clung to her father's breast, "since you have forgiven me. You will promise to take care of Thornton?"

"Die!" cried the father, rising bolt upright and fairly lifting her from the bed, all the strength of his youth coming back in that supreme moment. "You shall not die. You are going home with us; we have brought blankets, food, everything. The risk is not so great as remaining another night here; physicians—the best—shall be called in. No, you shall not die! You have not come home to die."

Nor did she die. Our simple tale has already been too long in the telling, or we might narrate how the sense of rest and peace that grew up in her now, the skillful care of the best physicians, and the knowledge that her boy's future was assured, all combined to work a cure that, otherwise, might have been regarded as almost miraculous.

To-day there is no more beautiful woman of her years in that great city than Margaret. She lives only for her father and her boy; they come, at least, before everything else. But she does not exclude herself entirely from society. To the select and cultivated circle of which she is the center and chief ornament, she gives freely of her varied accomplishments and of her exquisite charm of manner. But the memory of her dead husband is still green in her heart and ever will be; and though men of high station and even world-wide celebrity would woo her, if she would, to be the light of their home, they know, one and all, that her first and last love lies buried in that lonely grave on the blue shores of the Riviera, to which, every year or two, she makes a pilgrimage.

THE VIRTUES OF SILENCE.

In instances, and many might be mentioned, silence is chiefly used as a protective power, and that is no doubt its most obvious, though by no means its only use. In former days the Fellows of Trinity College, Dublin, were forbidden by statute to marry; but the violation of the rule, which in fact they seldom observed, was connived at so long as they maintained a discreet reticence on their connubial arrangements, and their wives bore their maiden names in public. One of these wedded celibates was asked by a friend, who had been much perplexed on discovering the state of the case, how he managed to hold his fellowship? "My dear sir," was the reply, "a man can hold anything who can hold his tongue." It follows, of course, that a man who wears his heart on his sleeve will let everything slip through his fingers. This gift of silence is characteristic of the "canny" Scot. A Scotchman will never "tell a lee," but he will make it next to impossible for you to discover what he most wishes to conceal. The surgical operation which is said to be so requisite for getting a joke into him is equally required for getting anything out of him when he prefers, as he very frequently does prefer, to keep his own counsel. He is an adept at beating about the bush, which is another way of saying that he knows how to hold his tongue.

But silence is not merely a protective power. If it often serves to conceal what there might be an indiscretion in betraying, it may also prove a positive means of influence. The Greeks thought it so difficult to "speak good-omened words" that they used the phrase as equivalent to what the Romans more directly termed a "sacred silence." And, great as is the repute which their philosophers, orators and poets have won by their writings, it is difficult to determine how much of the still grander reputation of Socrates is due to his having written nothing. In one sense certainly he was the reverse of silent, but he did not commit his thoughts to paper, and he has been credited—we do not say undeservedly—with more than the highest wisdom of those who undertook to report his utterances, while their weaknesses are attributed to themselves.

How much gain of influences and reputation in ordinary life is due to a judicious silence. We have all heard of Lord Thurlow's awful nod, but there are other professions than the law where a sententious silence has proved the secret of success. How many medical reputations have been built on a capacity for looking wise and saying nothing! A doctor who knows how to insinuate by tone and face and gesture his perfect command of the situation, without committing himself to specific assertions, may make a little skill go a long way, and may even make serious mistakes with impunity. It does not seem so easy for a preacher to trade upon his capacity of reserve, yet even in the clerical profession many have gained the reputation of profound divines and able guides in the spiritual life by a judicious management of platitudes. Nor would it be hard to show, on the other hand, how lofty reputations and brilliant prospects have been blighted by too open-mouthed frankness. It matters little what opinions an aspirant for political or clerical promotion may hold, so long as he understands when to hold his tongue about them; but a single slip may mar a whole career.

THE FOOD OF THE ANCIENTS.

The diversity of substances which we find in the catalogue of articles of food, is as great as the variety with which the art or the science of cookery prepares them. The notions of the ancients on this important subject, are worthy of remark. Their taste regarding meat was various. Beef they considered the most substantial food; hence it constituted the chief nourishment of their athlete. Camels' and dromedaries' flesh was much esteemed, their heels more especially. Donkey flesh was in high repute, and the wild ass brought from Africa was compared to venison.

In more modern times we find Chancellor Cupret having asses fattened for his table. The hog and the wild boar appear to have been held in high estimation. Their mode of killing swine was refined in barbarity as epicurism. Pigs were slaughtered with red-hot spits, that the blood might not be lost; stuffing a pig with assafœtida was a luxury. Young bears, dogs, and foxes (the latter esteemed when fed upon grapes), were also much admired by the Romans, who were also so fond of various birds that some consular families assumed the names of those they most esteemed. Cafius tells us how to drown fowls in Falernian wine, to render them more luscious and tender. Pheasants were brought over from Colchis, and deemed at one time such a rarity that one of the Ptolemies bitterly lamented his never having tasted any. Peacocks were carefully reared in the island of Samos, and sold at such a high price that Varro informs us they fetched yearly upwards of $10,000 of our money. The guinea-fowl was considered delicious; but the Romans knew not the turkey, a gift which we moderns owe to the Jesuits. The ostrich was much relished; Heliogabalus delighted in their brains, and Apicius especially commends them. The modern gastronome is, perhaps, not aware that it is to the ancients he owes his fattened duck and goose livers—the inestimable *foies gras* of France. The swan was also fattened by the Romans, who first deprived it of sight; and cranes were by no means despised by the people of taste.

While the feathered creation was doomed to form part of ancient delights, the waters yielded their share of enjoyments, and several fishes were immortalized. The carp was educated in their ponds, and rendered so tame that he came to be killed at the tinkling of his master's bell or the sound of his voice. The fame of the lamprey is generally known; and sturgeon was brought to table with triumphant pomp; but the turbot, one of which was brought to Domitian from Ancona, was considered such a splendid present that this emperor assembled the senate to admire it. The red mullet was held in such a distinguished category among genteel fishes, that three of them, although of small size, were known to fetch upwards of $1,000. They were more appreciated when brought alive, and gradually allowed to do die, when the Romans feasted their eyes in the anticipated delight of eating them, by gazing on the dying creatures as they changed color like an expiring dolphin. Snails were also a great dainty; Fulvius Herpinus was immortalized for the discovery of the art of fattening them on bran and other articles; and Horace informs us that they were served up, broiled upon silver gridirons, to give a relish to wine. Oysters were brought from England to Rome, and frozen oysters were much extolled. Grasshoppers, locusts, and various insects, were equally acceptable to our first gastronomic legislators.

STOP A MINUTE!

Don't hurry so. Move slower; it may be you will go surer. Grind, grind, grind—one everlasting grind from five o'clock in the morning till ten o'clock at night, chasing the bubble of human riches. What is the need, pray tell me? You already have enough—more than you can use. You are heaping up wealth for others to waste or quarrel over when you are dead. And one-half of your heirs, instead of recollecting you gratefully, will contemplate your departure from this hurrying scene with infinite satisfaction. Take our advice, rest awhile. You are wearing out the vital forces faster than there is need, and in this way subtracting years from the sum total of your life. This rush and worry day after day, this restless anxiety after something you have not got is like pebble stones in machinery; they grate and grind the life out of you. You have useless burdens; throw them off. You have a great deal of needless care; dump it. Pull in the strings. Compact your business. Take time for thought of better things. Go out into the air and let God's sun shine down on your head. Stop thinking of business and profit. Stop grumbling at adverse providences. You will probably never see much better times than these in this doomed world. Your most opportune season is now; your happiest day is to-day. Calmly do your duty and let God take care of His own world. He is still alive and is the King. Do not for one moment imagine that things will go to everlasting smash when you disappear from this mortal stage. This world got along very well before your advent into it; it will do as well when you vanish from it. Don't fancy that the curse of Heaven, in the shape of the vain task of righting up this disjointed earth, is imposed upon you. Cease to fret and fume; cease to jump and worry, early and late. The good time is coming, but you can never bring it; God can and will. Take breath, sir. Sit down and rest and draw a long breath. Then go calmly at the tasks of life and do your work well.

A SAD AND PRETTY ROMANCE.

Not long since a young woman applied for medical relief at the city dispensary in St. Louis. Her appearance was extremely prepossessing and excited the sympathy of the physician in attendance to whom she related the familiar tale of love and desertion. She was given a permit to the hospital and there became a mother. On her recovery, she was eager to repay the kindness of which she had been the object, and was given employment as a nurse in the same institution. Here she would have remained in all probability—for her attention to the duties of her position was unremitting—had not a lady visitor become strongly interested in her behalf. The lady offered Alice Corbin, the name she had given, a place in her own family as a seamstress, and she thus secured a pleasant home for herself and child. She was becoming reconciled to life and was learning to be happy, when the son of her benefactress was brought home to die, he having been stricken with a fatal attack of fever. The lady idolized her son, and had always spoken of him to Alice as a model of what a young man should be in manner, habits and character. Alice entered his room as a nurse and recognized in him—her betrayer. He had become acquainted with her under an assumed name, as now appeared. She had, therefore, entered unaware under his mother's roof. He recognized her, and with that calmness which is always the accompaniment of approaching dissolution, bade her sit down, and tell her story. She ended by saying that the child of their sin was with her but by no word of hers should his mother even suspect the lad's parentage. Then, said he, "I will tell her myself. Go out Alice and send my mother to me." The result, as stated in the Times, which vouches for the facts, was that a clergyman was sent for and "marriage mended the broken promise." The husband soon died and Alice remains as a daughter in the mansion she had entered as a seamstress.

"SHOOST VAIT!"

The other day, says the Chicago Tribune, a simple minded German called on a grocer to pay a bill, giving him a $10 note. The grocer examined it closely and said, "Hullo, where did you get this note?" "Vot is de reasons mid dose note?" replied the honest Teuton; "don't she as good, hein?" "Good!" answered the grocer, "why, you're a lucky man—that note is worth $10.50." "Ish dot so? Why for?" "You see the signature over here, don't you?" "Dose tings like a cork-screw mit de worms? Yah." "Well, that's Spinner's signature." "Vell." "Well, Mr. Now is now treasurer of the United States." "You don't tole me so; "vell." "Well, and notes signed by Spinner are getting scarce, and people pay five per cent. more for them than for the new issue." "By Shimminy, ish dot so?" "Yes. Lemme see your bills. Why every one of them is a Spinner! Man alive, your fortune is made."

In pursuance of the grocer's advice, Mr. Schneider called at the sub-treasury, Saturday afternoon, to get the premium on his bills. What success he had it is impossible to state, but he was seen later in the evening lurking round the street by which the grocer must go home, and on being accosted by an acquaintance the following conversation took place: "Der peeble von Sharmany lights well, hein?" "Oh, yes; the Germans are unquestionably a military nation of the first class." "Some big fights, hein? Liepsic?" "Yes." "Und Sadowa?" "Yes." "Und Koniggratz?" "Certainly." "Und Worth, und Mars-la-Tour, und Gravelotte, and Sedan?" "Of course." "Dose was all big battles, und der Deutch licked?" "Yes." "Vell, you joost vaits till that grocery store shuts himself, and you saw a Deutch victory vot makes you forgot dem little ones."

BE ECONOMICAL.

"Take care of the pennies." Look well to your spending. No matter what comes in, if more goes out you will be always poor. The art is not in making money, but in keeping it. Little expenses, like mice in a barn, when they are many, make great waste. Hair by hair, heads get bald; straw by straw the thatch goes off the cottage, and drop by drop the rain comes into the chamber. A barrel is soon empty, if the tap leaks but a drop a minute. When you mean to save, begin with your mouth; many thieves pass down the red lane. The ale jug is a great waste. In all other things keep within compass. Never stretch your legs further than your blankets will reach, or you will soon be cold. In clothes choose suitable and lasting stuff, and not tawdry fineries. To be warm is the main thing, never mind the looks. A fool may make money, but it needs a wise man to spend it. Remember, it is easier to build two chimneys than to keep one going. If you give all to back and board, there is nothing left for the savings bank. Fare hard and work hard while you are young, and you will have a chance to rest when you are old

Sabbath Reading.

KEEP.

Keep to the right as the law directs,
Keep from the world thy friend's defects;
Keep all thy thoughts on purest themes,
Keep from thine eyes the motes and beams.
Keep true thy deed, thy honor bright,
Keep firm thy faith in God and right,
Keep free from any sin and stain,
Keep from the ways that bring thee pain
Keep free thy tongue from words of ill,
Keep right thy aim and good thy will.
Keep all thy acts from passion free,
Keep strong in hope, no envy see.
Keep watchful care o'er tongue and hand,
Keep free thy feet, by justice stand;
Keep true thy word, a sacred thing,
Keep from the snares the tempters bring.
Keep faith with each you call a friend,
Keep full in view the final end;
Keep love between thy God and thee,
Keep from all hate and malice free
Keep firm thy courage bold and strong,
Keep up the right and down the wrong.
Keep well the words of wisdom's school,
Keep warm by night and by day keep cool

THE LENTEN SEASON.

The Lenten season began March 1, that being Ash Wednesday. Rev. Thomas K. Beecher suggests that this season of devotion, the inheritance of so many Christians throughout the world, be accepted by all denominations. Its yearly observance in the Episcopal church, it is not too much to say, produces as large a proportion of conversions, as the revivals of other churches.—A correspondent in Carbondale, Pa., desires us to urge, and ask all Christians to urge, increased activity in prayer. He wants all the churches to "call special prayer-meetings—praise prayer-meetings—to pray for relief from the prostrating influence of the panic, that all may accept the true lesson of these dark times, and that all may do what they can to bring about a more prosperous condition of affairs. 'Our God is a very present help in time of trouble.' Now is a ripe time for Christian work, for many people are humbled, their hold on earthly things has been loosed; their houses have been broken up, and they seek for employment in vain. There is work to do for Jesus. Let us make our religion public, make it supply a want which is now felt more than ever before. A plan is on foot to place religious reading in every railroad depot in our country. Let Christians everywhere co-operate to speed the good work." The American railway literary union, we suppose, co-operates with the Bible society, in this plan, alluded to in the last sentence of the above letter. The union has done good service in obtaining the banishment of low and vicious reading matter from many of the railroad lines. The New England branch of the society has gained this point from all the railroads running out of Boston, except one. Some roads in this part of the State need this supervision. It is a genuine Christian work.—*Ex.*

THE BEST SERMON.

People are always listening to the "best sermon they ever heard." At an advanced age, still hearing the "best," we might conclude that they started up very poor ones; for this superlative did not, perhaps, express the opinion of some other person equally able to judge. But there are various kinds of sermons. There is the doctrinal one, the biographical, logical, illustrative, and various other styles; and men speaking of the "best," will mean the best of those several kinds. Then men are in varying conditions for hearing. If they are full of joy, the best one will be glad and enthusiastic. If they are borne down with sorrow, their praises are only for the consoling and sympathetic. Just in so far as the sermon is suited to the hearer, and is blest to his edification by the Holy Spirit, will he find it such as he will greatly praise. The really good hearer will find something helpful in all, and now and then he will be flooded with happy emotion.

THE SABBATH.

Gladstone, the English statesman, says:—"Believing in the authority of the Lord's day as a religious institution, I must, as a matter of course, desire the recognition of that authority by others. But, over and above this, I have myself in the course of a laborious life signally experienced both its mental and its physical benefits. I can hardly overrate its value in this view; and for the interest of the working men of this country, alike in these and in other yet higher respects, there is nothing I more anxiously desire than that they should more and more highly appreciate the Christian day of rest."

Misplaced Fear.—All languages have a literature of terror about death. But living is far more terrible in reality than dying. It is life that foments pride, that inflames vanity, that excites the passions, that feeds the appetites, that founds and builds habits that establishes character, and, binding up the separate straws of action into one sheaf, hands it into the future saying, "As ye have sowed, so shall ye reap;" and again, "As ye reap, so shall ye sow!" Yet life, which is the mischief maker, is not at all feared. Death, that does no harm, and is only the revealer of life's work, is feared.

The wealth of a man is the number of things which he loves and blesses, which he is loved and blessed by.—*Carlyle.*

Ladies' Portfolio.

A FIRESIDE LYRIC.

BY D. W. C. PACKARD.

I sit by the cheerful firelight,
In my home secure and warm,
But without is the howl of the tempest,
And the pitiless pelt of the storm:

And I muse on the wretched and homeless,
Who wander for shelter and bread,—
And I pray to the merciful Master,
That they may be covered and fed.

Think not of the crime, nor the weakness,
You know we can hate the sin,
And yet open the gates of mercy,
And tenderly take them in:

I think of the little children,
Adrift in the city's street,
And shudder at thought of the thorny ways,
To be trod by their sinless feet.

Oh, many a pure young spirit
Would be saved a woman's shame,
Were to-night but a crust, or a pittance,
Doled out, instead of blame.

Is there pity left in our sordid souls?
Have the prayers of the poor grown old?
Ah, woe, when the coffer is getting full,
And the heart is growing cold!

Now, as we pile the cheerful fire,
And hear the roar of the storm,
Let Love rekindle within the breast,
A flame to keep it warm!

WHICH SEX IS SUPERIOR?

UNDER the heading of "What Do You Think About It?" FRANCES D. GAGE of New York City, contributes the following sensible and suggestive article to the Woman's Journal. It certainly makes some good points in favor of Women Suffrage:

It is impossible to decide which sex was created superior or which inferior, while the condition of the two remains as mixed as at present. Dr. M., who is female, would weigh fifty pounds more than Dr. H., who is male, and could lift him in her arms out of any difficulty that his littleness might fall into. His eyes are blue, hers are black. His hair is flax color, hers like midnight. His voice is piping and child-like, hers a full round bass. He passed into his profession honestly, she with great *eclat*. He has a small practice, she one that is overwhelming. He is soft, docile, amiable, smiling, has pretty white hands and little decision of character, while she is stern, decided, resolute, and independent. He would turn white while amputating a limb, she would not blanch.

But what does it all prove? Nothing! She is a woman—he, a man; she is superior in some things, he in others. Why should he be granted rights and immunities denied to her? Which is superior?

BESSIE sings soprano and WILLIE sings alto; which is superior? TOM can plow and HATTIE can cook and weave. He might cook and she might plow; would it prove anything? A woman may run a farm or drive cattle—she may take charge of a saw-mill or learn the blacksmith's trade, and may be perfect in her art in each and all. Yet it would only prove that a woman could do those things, nothing more; not her superiority, or inferiority, or equality. Nor does it prove that a woman, in following these so-called "masculine employments," needs or can use for her own benefit, the right of Suffrage or the privileges of equality before the law any more than she can so use them as a maker of biscuits or of dresses.

Old BILLY LAMB was declared by the proper authorities of Morgan Co., Ohio, to be *non compos mentis* and entitled to board and lodging in the poor house while his wife, who was so much his superior that she could scrub and sweep, was denied the same favor. Every woman in the country whose labor enriched the nation by making a web of cloth or a pound of butter, or by cooking a meal of victuals for hungry laborers, in just so much helped to pay the taxes, in an indirect way, which gave this "superior" man his board, lodging and clothes. And yet, on every election day for fifteen years, this pauper was brought to the polls to give his vote for every county officer, and stood, in politics, an individuality in importance equal to the Governor of the State or even to the President of the United States, and could help elect Commissioners who would let him into a home and shut his wife out of it. Yet he was the more able to work of the two, and could have scrubbed and swept as well as she, only he would get drunk, and he and his peers always licensed the dram-shop. Who was the superior—BILLY LAMB or the lady principal of the school?

Mr. PUTNEY inherited a large home with stock, farming utensils and money in bank. He was father of seven children, lived fast, gambled, drank, and wasted his substance. One day he made a will, and willed away all but one of the children, including one unborn, to strangers. All the property he left to his wife and, like a man, locked himself up in a tavern room and blew his brains out. His will of course was not legalized, and his creditors came together to consult. The wife said to them, "Leave me my farm and my children and I will try to pay you all, in time." And the heaviest creditor said, "Let us do it and save this mother of seven children, the eldest not twelve years old, from bitter poverty and toil." And so it was agreed. The wife took the place of administratrix, carried on the farm as head manager; was mother, housekeeper, nurse, farmer, stock raiser and bookkeeper. She paid off the mortgages. When her children were ready to go out into the world their portion was ready for them, and they were ready to rise up and call her blessed. Was he or she superior?

A lady had two sons and one daughter; each attempted college studies. The boys failed; one from stupidity, one from ill health. The girl went through triumphantly. That was no proof that boys should not go to college. What do you think about it?

HOW SHALL WE DRESS?

MRS. HENRY WARD BEECHER says "That in making purchases it is economy to select as good articles as one's income will warrant, for there is no saving in buying anything because it is cheap, unless it is serviceable. To buy a needless and flimsy article because the price is unusually low is waste, not economy. For daily use the dress should be chosen with reference to the work that must be done while wearing it. Make it neat and comfortable for such work without regard to style, unless, by some unusual freak, fashion may have adopted something simple and convenient. To see girls sail through a kitchen or bend over the wash-tub in a trailing wrapper, sweeping the dirt from the floor or soaking in the suds, should prevent more sensible women from giving the warrant of their example to those under their influence. None should marry who cannot begin life with enough to enable them to dress with neatness, modesty, comfort and good taste, without unduly encroaching on their income. No article is cheaper for being ugly. First be sure of the price, then examine the quality of the goods to be purchased. Ginghams and calicoes are the most serviceable for working or morning dress, because they can be washed. The less cotton there is in woolen fabrics the longer they will last without looking shabby. If a person must be much in the kitchen or finds it necessary to attend closely to the cooking, woolen dresses are so difficult to clean that if they are used it is prudent to have a long sack apron, made with sleeves, reaching almost to the bottom of the skirt. It is commonly held that one silk dress at least is indispensable. We see no pressing necessity for it; one can be truly respectable without even one silk dress. Our American silks are the most enduring and economical of any kind of silk, and one dress will outlast two or three of other materials, unless it may be those very silks beyond the reach of persons in moderate circumstances, costing from six to eight dollars a yard.

SUNNY ROOMS MAKE SUNNY LIVES.

LIGHT is one of the most active agencies in enlivening and beautifying a home. We all know the value of sunlight as a health-giving agent to the physical system; and it is not less so to our moral and spiritual natures. We absorb light, and it nourishes us with strange power. We are more active under its influence—can think better and work more vigorously.

Let us take the airiest, choicest and sunniest room in the house for our living room—the workshop where brain and body are built up and renewed. And let us there have a bay window, no matter how plain in structure, through which the good twin-angels of nature—sunlight and pure air—can freely enter.

This window shall be the poem of the house. It shall give freedom and scope for eye and mind. We shall hang no picture on our walls that can compare with the living and everlasting pictures which God shall paint for us through our ample window. Rosy dawns, golden-hearted sunsets, the tender green and changing tints of spring, the glow of summer, the pomp of autumn, the white of winter, storm and shine, glimmer and gloom—all these we can have and enjoy while we sit in our sheltered room as the changing year rolls on.

Dark rooms bring depression of spirits, imparting a sense of confinement, of isolation, of powerlessness, which is chilling to energy and vigor; but in light is good cheer.

Even in a gloomy house, where walls and furniture are dingy and brown, you have but to take down the heavy curtains, open wide the window, hang brackets on either side, set flower pots on the brackets and tyes in the pots, and let the warm sun stream freely in, to bring health to our bodies and joy to our souls.

FOR AND ABOUT WOMEN.

MRS. ABRAHAM LINCOLN is spending her time very pleasantly at Springfield, Ill., and seems likely to entirely recover from her recent attack. A short time ago she presented to Jesse K. Dubois of Springfield, one of Mr. Lincoln's most intimate and political friends, a gold-headed ash cane inscribed, "Cut from the birthplace of A. Lincoln and presented by Dr. J. H. Rodman of LaRue County." The cane was presented to President Lincoln during his lifetime.

MR. WM. L. BURT, late Postmaster of Boston, employed about thirty women as post-office clerks. He says of them:—"The women have proved far superior to men in looking up missent and misdirected letters and in making returns to the Dead-Letter office. They have also proved entirely reliable. There has not been a single instance in nine years where the accounts of any woman have shown a deficiency of $1 in the Boston Post-Office."

A WESTERN lady gives the following advice to girls engaged in looking up a husband:—"Look out for physical health and beauty for the sake of the race. Do not bestow a glance on the lean, dyspeptic, cadaverous biped; shun him as you would a pestilence."

Reading for the Young.

THE FIRST SWALLOW.

[SEE ILLUSTRATION ON PAGE 189.]

BEAUTIFUL wanderer, whither was thy flight
On that sweet autumn day that saw thee last,
Toying in the warm sunshine's fitful light,
That called back memories of summer past
And all the joys that were too bright to last?
Perchance thou lighted'st on some giddy mast,
When spent and weary was thy tiny flight,
A waif upon the trackless ocean vast.
Welcome once more! with me the hours have flown
Towards the last haven that we all must reach;
Would that our lives were guileless as thine own,
Proud as we are of reason and of speech;
And may we, passing o'er life's stormy sea,
As truly find the Home where we would be.

LETTERS FROM BOYS AND GIRLS.

From a Kentucky Girl.

MR. EDITOR:—As I wrote to the Girls' and Boys' Column about four years ago, and you were so kind as to publish it, I have often thought of writing again, but have neglected it. If I were in the girls' place I would not condescend to notice what YOUNG TOM says, for he surely must be a mere fop, or he would not talk as he does. I agree with DELL B. W., in the RURAL of Feb. 6th. I think her picture was very well formed, and if she will write another letter in the same manner, I think his long tongue will be cured. We have had plenty of snow this week, but it is melting rapidly now. I tried to get up a club for the RURAL this year, but there is not a chance for getting up a club in town. We have taken the RURAL for several years, but we did not get last week's paper. We would like very much to have it. As my letter is getting quite lengthy I will have to close, hoping to hear from the RURAL Cousins soon.—SALLIE H., *Owensboro, Ky., Feb.*, 1876.

From a Pennsylvania Boy.

DEAR EDITOR:—Having read many of the Boys' and Girls' Letters, I thought I would try and write you one. My father has taken your paper for about five years. We all like it very much; my sister says she always looks for the Boys' and Girls' Letters first, and my father thinks it is a paper every family should have. The former's especially. Some men think that the price is too high, but father says he could not do without it for five dollars a year. I would like to speak to that small boy of New York State, who tells us that he dug 225 bushels of potatoes in ten hours. I would like to ask him whether he dug them all in one day, or whether he only worked one or two hours a day. I don't think there is any boy that can do it in one day. I am a boy myself 15 years of age, and I don't think I could do it. I wish he would answer my question through the pages of the good old RURAL. I would also like to hear from WILD ROSE, the Indian girl, if she is still within the limits of the RURAL's reach. Dear Mr. Editor, I have often seen in the RURAL letters from boys and girls asking you to put your photograph in. I have seen in your paper the pictures of great men, but I never saw yours. I would like to see it very much.—WILLIAM TAYLOR, *Manor Station, Pa.*

From that Young Potato Digger.

DEAR RURAL BOYS:—I snatch up my pen to respond to your requests. When I read the letter from the Eastern Boy, asking me how many potatoes I dug out of a hill—that means, did I count them?—I was indignant at such a question. This is why I did not reply. In your own statement you called it a big ten hours' work to do what I did actually do, and in addition you ask me how many potatoes there were in a hill. Maybe you could have counted them as they flew. My father measured the same potatoes in the field for market, and they overran weight in market. I would say to the Michigan Boy, the hills were twenty-eight inches apart; the ground was nice and free from weeds, and the potatoes were the Early Rose. I dug five hours in the forenoon and five hours in the afternoon by the watch, which we had in the lot, and father kept the time. I wanted to dig the rest of the day, but father would not let me. I have been thinking I would have my physiognomy taken and send it to Mr. MOORE, if I thought he would put it on paper so you could see what manner of boy I am. I do a great many kinds of work on the farm, but I call a farmer's life a slavish one. I am trying to obtain an education that will enable me to gain my livelihood by other means besides farming; it may be to assist Mr. MOORE in making up his paper. I cannot tell what the future will reveal to me. I live in the town of Mt. Morris, but our post-office is Nunda.—NORMAN KEYES, *Nunda, Liv. Co., N. Y.*

From a New York City Boy.

DEAR RURAL:—I attend school in the city and am nine years old. I am very fond of riding on horseback, and go to a riding school. I have no pets, except two gold fish. Two years ago we took a cottage at Yonkers on the Hudson, and when we were there I had two rabbits, and a coal-black cat named the "Imp of Darkness." Last summer we went to Martha's Vineyard. When I was there I had fine sport going out in little boats, and catching crabs out on the wharf. One day we went from Martha's Vineyard to Nantucket, on the steamer "Island Home." When we got there we went to the oldest house in the place, which is over 100 years old. We found many queer old things there. We saw an old spinning wheel, an old hat of Revolutionary times, and many other things. I was quite seasick on the way back from Nantucket. We came home by the way of Boston. We went to the Museum, the Common and other nice places.—D. D. T. M., JR., *New York City.*

From an Ohio Boy.

DEAR COUSINS:—I think YOUNG TOM had better keep still about the girls writing "such short letters" and then calling them too long. Now I have a better opinion of the girls than that, for I think they are the smartest. I wish "YOUNG BUCKEYE" would give me his post-office address, for I would like to write to him. I have a few curiosities. I will name some of them. One is a piece of bark from a mammoth tree in California—it is about an inch and a half in thickness, and I have a stone from the Devil's Wash Basin in the Mammoth Cave of Kentucky. I have several other curiosities, but it would take too much room to name them. I expect to get some curiosities from China. I have been sick with the lung fever for some time, therefore I am very nervous. Good-by.—JERRY POSTAL, *Bellefontaine, Ohio.*

From Wild Romp of Missouri, Again.

MR. EDITOR:—As you were so kind as to publish my other letters, I though that I would write again. I go to school this winter and study Arithmetic, Algebra, Grammar, Morals and Manners, Natural Philosophy, Familiar Science and Dictionary. I should like to correspond with MINNEHAHA, HATTIE J., and SCHOOL GIRL. If it would be agreeable to them.—WILD ROMP, *Canton, Mo.*

From a Lockport Girl.

DEAR EDITOR:—Will you be so kind as to print a letter from a Lockport girl? I have not seen any letters from Lockport, so I thought I would write one. I think the RURAL is a very interesting paper. Pa has taken your valuable paper for the last twenty years. I go to a select school. I study Arithmetic, Reading, Geography, Spelling, Writing and Drawing. Every Friday afternoon we have speaking, reading and object lessons, which are very interesting. I have not as many pets as some of the RURAL girls have. I have one pet, a black, shaggy dog named "Towzer." Will some of the girls please send me a pattern of some patchwork quilt; I have pieced six. I hope to hear from YOUNG BACH and the Rochester girl soon.—ETTIE S., *Lockport, N. Y.*

From a New Jersey Girl.

DEAR RURAL:—I am a little girl twelve years old. I go to school and study Grammar, Arithmetic, Reading, Spelling, Writing and Geography, and have been studying Botany, but shall leave that off until spring, when our class can find some specimens. I like it ever so much. I think it is splendid to print letters from boys and girls. My father buys the RURAL at the news store every week and I almost always turn first to "Letters from Boys and Girls." I like to read letters from ROMPING BESSIE, and hope she will write again. I am a great reader and hope to be a teacher sometime. We keep two cows and have a calf about one and a half years old. Her name is "Bessie." I have a sister seven years old, and have a great many good times with her.—CORA A. LINDSAY, *No. Vineland, N. J.*

The Puzzler.

CROSS-WORD ENIGMA.—No. 6.

My first is in dog but not in cat;
My second is in east but not in west;
My third is in calf but not in cow;
My fourth is in land but not in water;
My fifth is in warm but not in cold;
My sixth is in sun but not in moon.
My whole is a leading town in Texas.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We Ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

HOME NEWS PARAGRAPHS.

THE membership of the trade unions in New York city has fallen from 48,000 in 1873 to 18,000, and of the 75,000 artisans, mechanics and laborers in the city about one-third are out of employment. Wages in all of the building trades, have come down to $2 a day, and those of laborers and longshoremen to $1 a day.

According to the Tribune the New York and Manhattan Gas Company paid 20 and 35 per cent. dividends, last year, on a capital of $4,000,000 each; the Mutual and Metropolitan paid 10 per cent. each, and the Harlem, which supplies the upper end of the island, 8 per cent.

The Woman's Journal says that Mrs. Margaret Boggs celebrated her hundredth birthday at Germantown, near Philadelphia, two weeks since. Her maiden name was Donaldson, and she married at seventeen, eighty-three years ago. She danced a minuet with George Washington when she was eighteen and he was sixty-two years of age.

Delay in constructing the rapid transit road seems possible only on account of the opposition along the route. The plans are almost entirely matured; the support of capitalists is not wanting, and it appears quite practicable to have the eastern section of the road completed to the Grand Central Depot within the present year.

A correspondent of the Chicago Journal has a plan to heat cars of all kinds that entirely does away with the chances of burning in case of accident. He discards stoves, hot water and steam, and uses red hot shot that weigh 100 pounds each, in a box under the car, with registers in the floor of the car. Five balls will heat the car for four hours; the furnaces for heating to be placed along the stations, one hundred miles apart. He states that a trial has been had and it works satisfactorily. A patent based on this general plan has been applied for. The recent fearful accident by which two human lives were lost through the burning of a sleeping car by overturning and taking fire from the stove, as well as others of a similar nature in the past, render any means of preventing such horrors especially valuable and worthy of consideration.

The Rev. Mr. Mann, an Oregon clergyman of the Presbyterian Church, has met with such success as a missionary among the Indians at the Puguyallup Reservation, Washington Territory, that he proposes to settle there permanently.

It is thought that the sea lions in San Francisco Bay destroy too many fish, and it is therefore proposed to exterminate them. Seth Green protests against this, saying that they are not nearly so destructive to the fish as the Chinese. He recommends a judicious reduction of their numbers as the better plan in regard to them.

A bill before the California Legislature would, if passed, prohibit the sale of intoxicating liquors within four miles of the State University; and the San Francisco Chronicle says the title should be "An act to promote pedestrianism among students."

The Union county (N. J.) Coroners did not qualify in time, and Union county is therefore without coroners. It is to be hoped the other New Jersey coroners are all qualified. One of them not long since was examining a doctor in an inquest on the case of a little girl run over by a horse car. The doctor said death resulted from injury to the spine. "Doctor," interrupted the Coroner, "was it the spine of her back?"

A dispatch from Chicago, March 9, says: Hesing, Rehm, and several of the distillers indicted by the last Grand Jury, are attempting to make a compromise with the Government, and plead guilty on some of the counts in the indictments against them. They have held numerous conferences with District-Attorney Bangs both yesterday and to-day, and rumors are prevalent that they have made propositions to give evidence valuable to the Government.

Moody and Sankey's success in New York is making the Herald think seriously what will become of its columns if the millennium should soon be inaugurated. It is probable, however, that our lively contemporary would have no trouble in reversing its policy and adapting itself to the new administration, even though chaining up the Devil for a thousand years involved an entire change in the Herald's editorial force.

A dispatch from Philadelphia, Penn., March 9, says:—The Legislative Committee to investigate municipal affairs at Pittsburgh met again yesterday and examined Mayor McCarty. Subpœnas were issued for City Treasurer Magee, Controller Snodgrass, City Assessor Phelps, and City Attorney Bigelow, all of whom refused to respond until the Committee decided to give their cases to the Grand Jury.

The Bon Ton House, at Ocean Parkway and the Coney Island road, Flatbush, a well-known resort, kept by Mrs. Peter Gleavy, alias "Widow Jack," was burned on Wednesday night, March 8. Loss $28,000.

The body of Richard Kane, a life forger, aged 50 years, was found lying on the rocks just below Henderson's Dam in the Matteawan creek Mar. 8. There were two deep gashes, one on each side of his head. Coroner Schouten and a jury held an inquest, and rendered a verdict of accidental drowning.

The new transatlantic line, which it is proposed to establish between New York and Galway, is to have a capital of half a million pounds sterling, in five hundred shares of £100 each. For a start, only four ships are to be purchased, and two trips a month are to be made. The chief backer of the line is the Midland Great Western Railway Company. The first steamship will sail in May from Galway.

When the 2.30 train on the Connecticut River Railroad left Springfield on Mar. 6, two gentlemen failed to connect. Superintendant John Mulligan, who was standing on the platform, saw the sad disaster, and taking pity on the belated travelers, telegraphed to hold the train at Holyoke till further orders. Then he jumped on the Holyoke engine with the laggards and rushed them into Holyoke in ten minutes, and didn't half try; distance ten miles. When the passengers reached the waiting train they were as much out of wind as if they had run the ten miles on foot.

The Bath County, Ky., News says:—On Friday Mar. 3 a shower of meat fell near the house of Allen Crouch, who lives some two or three miles from the Olympian Springs, in the northern portion of the county, covering a strip of ground about 100 yards in length and 50 wide. Mrs. Crouch was out in the yard at the time, engaged in making soap, when meat which looked like beef began to fall around her. The sky was perfectly clear at the time, and she said it fell like large snow flakes, the pieces as a general thing not being much larger. One piece fell near her which was three or four inches square. Mr. Harrison Gill, whose veracity is unquestionable, and from whom we obtained the above facts, hearing of the occurrence visited the locality the next day, and says he saw particles of meat sticking to the fences and scattered over the ground. The meat when it first fell appeared to be perfectly fresh. The correspondent of the Louisville Commercial, writing from Mount Sterling corroborates the above, and says the pieces of flesh were of various sizes and shapes, some of them being two inches square. Two gentlemen who tasted the meat, express the opinion that it was either mutton or venison. Some of the flesh was taken to Louisville and given to Prof. Lawrence Smith, a well-known scientist, who says it is without doubt animal flesh. Hundreds of persons are willing to attest with affidavits the truth of the entire matter.

The President's friends say that Babcock turned over to Belknap the complaining letters received from army officers and addressed to the President about extortions and over-charges by post traders. The President was charged with disregarding protests and complaints from high army officers, among whom were Sheridan and Sherman. Copies of letters forwarded two and three years ago were received, and the President declared that he had never seen them. They had all been concealed from him by his trusted private secretary.

The search for the lost treasure of the ship Mexico, wrecked on the Rockaway Beach, off Freeport, on the south shore of Long Island, in the winter of 1836, is being prosecuted with vigor by the Coast Wrecking Company. They have two schooners in the vicinity "sweeping," and on Mar. 10th, they fastened upon a portion of the wreck, which was buoyed. A diver then went down and fastened a rope to what proved to be a large anchor of an old pattern. This is the second anchor found. The company feel confident that they will recover the treasure, amounting to some $500,000.

The second span of the Scioto Valley Railroad bridge now being constructed across the river at Chillicothe fell Mar. 10, and ten or fifteen workmen fell a distance of thirty feet into the river. Byron Leach was killed and several others were more or less injured, but one of them fatally.

A plan for a general jail delivery was discovered at Poughkeepsie, N. Y., March 10. A prisoner imparted the information to the jailer. At least six burglars were concerned and the break was to be made at midnight of the next night. Various implements were found in the burglars' cells. In one cell a hole had been cut through the ceiling. A double guard has been placed upon the jail.

Victor Bishop, the Broadway jeweller, who formerly kept under the Fifth Avenue Hotel, N. Y. City died March 10 at the age of 60 years. It was he who, seven or eight years ago, sold the famous great diamond to George Henriques for $30,000. Mr. Bishop leaves a wife, sister of the late Mr. James Gorden Bennett.

FOREIGN NOTES.

THE Shah of Persia thought postage stamps such an admirable thing when he was in Europe that he had a large lot printed in Paris and sent to Teheran, but as there are no post offices in his dominions they are not eminently useful.

It is officially reported from Tomas de Gibare, Feb. 29, that 300 Spanish cavalry, while scouring the country, met 600 mounted insurgents, commanded by Maximo Gemez. The Spaniards hardly had time to draw their sabres. A hand to hand combat followed, lasting an hour, at the end of which time they remained masters of the battle field. Their loss was 26 killed and 33 wounded. The loss of the enemy is considered at least equal. Captain-General Jovellar reached the scene very soon after he heard of the fight. This is the first engagement of consequence which has taken place for a long time.

A despatch to the London Standard from Berlin states that Count Von Arnim has instructed his lawyer to inform the judge that he is ill, and little inclined to defend himself against the charge of high treason.

The Porte has notified the ambassadors of the guaranteeing Powers that it will remit tithes for one year and all other taxes two years to all refugees who return to their homes. Special officials will be appointed to protect them from outrage, and farms and churches will be repaired at the government expense.

A telegram has been received by the Japanese Legislation at London from their government, stating that a treaty between Japan and Corea was signed on the 27th ult.

A movement is on foot to raise funds to send the St. John, N. S., Paris crew to Philadelphia. A boat has been ordered from Jewett, the English builder, and the crew will go into training early in the Spring.

About 20 vessels are loading ice at Kingston, Ont., for Toledo and Cleveland.

Don Carlos received at Boulogne a deputation of 150 Legitimists, who presented an address. He has issued a manifesto to Spaniards in which he says: "Desiring to stop bloodshed, I forbear continuing a glorious but at present fruitless struggle. Seeing the sufferings of my volunteers and the superiority of numbers against them, it becomes necessary to sheath the sword. I will never sign a compromise. My flag remains folded until the moment which God shall fix as the supreme hour of redemption." In an address to his soldiers, Don Carlos congratulates them on the heroism they have displayed, and bids them not abandon hope. Carlos is under the constant surveillance of the Boulogne authorities. The total number of Carlists who have taken refuge in France is 15,000.

Hotel keepers at Nice have not done well this winter, and some have nightmares of red flags, bankrupt sales, &c. The place has fallen into bad repute, and former patrons are conspicuous by their absence.

The father of all newspapers is the venerable Pekin Gazette, which is over 1,000 years old. It is a ten-page paper, with a yellow cover; has no stories, no "ads.," no marriage or death notices, no editorials, no subscribers. It simply contains the official notices of the Government.

A writer in a leading German quarterly says that the peasantry of Russia are in a worse condition than they were when Alexander II. abolished serfdom fourteen years ago. They do not live so well, and idleness, drunkenness, tramping, bloodshed and arson, have increased to a frightful extent. The writer attributes this result to the bad management of the Government. The peasant is the slave of the Commune, which controls his person and his property in such a way as to leave him no liberty. The Commune is more despotic than the master used to be.

Figaro says that the plum pudding of Paris restaurants is made of sweepings of the tables, crumbs, stale cakes, leavings of the previous day, sour cream, and the like, boiled for hours to acquire a proper consistency, and then served with a fiery brandy sauce to disguise the flavor.

The arrows used by the Papuans, and with which Commodore Goodenough, of the British Navy, was killed, are poisoned by plunging the bone points into a human corpse and leaving them there for several days. The wound inflicted by these arrows causes a malignant and inevitably fatal blood poisoning.

A vote on the liquor question recently obtained by the temperance societies from the large cities of Ireland—namely, Dublin, Belfast, Cork, Waterford and Limerick—resulted in 69,270 temperance votes out of 78,185—8,915 being unfavorable to the movement.

A man, who said he was very poor, nearly blind and unable to work, and whose appearance justified his words, was recently, in London, fined six cents and two shillings costs for not sending his son to school. He was unable to pay it, and was sent to jail for five days.

The *Boersenzeitung* says that the new iron-clad gunboats on the Rhein, two of which have just been on trial trips, will on account of the difficulties experienced in manœuvring them, probably prove failures. From the lofty banks between Bingen and Coblentz an enemy's battery could easily sink them, and their course could be arrested by simply stretching a few nets across the stream.

The Nagasaki Rising Sun says that the Buddhist religion is fast declining. In Yamashima Ken alone seventy-one Buddhist temples have been abandoned since 1873, and during the past six years nearly 700 temples have been converted to other purposes than those to which they were built.

Japan has a Bible-in-the-schools controversy, the Buddhists endeavoring to have the reading of the Bible in the Christian school in Kiyoto prohibited by order of the Emperor. The Buddhists are very influential, and are favored by the Emperor, but his chief counsellor and the Minister of Education are friendly to Christianity.

A deputation of the London Trades' Council recently urged the Duke of Richmond, a member of the British Ministry, to lower the importation duty on foreign cattle, which keeps the price of meat so high in the Metropolitan market, but his Grace could hold out no hope to the applicants that the Government would resort to a measure deteriorating the value of home cattle.

The London Daily News of March 8, says:—The appointment of Richard H. Dana, jr., as American Minister to the Court of St. James is one of the most acceptable that could be suggested. It revives the old tradition of honoring men of letters with important positions. Mr. Dana will be welcome here on many accounts. The appointment seems to indicate a return to a healthier sense of public duty in the distribution of posts.

Reuter's telegrams from Vienna to London state that the special dispatch to the Venice *Tempo*, March 7, stating that the republic had been proclaimed in Servia, the Obrenovitch dynasty deposed, and Prince Milan himself escorted to the frontier, is entirely unfounded. Perfect order and tranquility prevail throughout Servia. There have been no disturbances since the insignificant rising at Kragujewatz during the communal elections a few days ago. Even those were immediately suppressed.

Advices from Madrid, March 8, say:—In the Cortes to-day a member interrogated the Government in regard to the recent capture of an English merchantman by Spanish coast guards, and the recapture of the vessel by its own crew. The Minister of Foreign Affairs, in reply, stated that he had made representations to the British Minister in Madrid, demanding satisfaction and protesting against the contraband trade pursued by English vessels from Gibraltar.

A royal decree permits the Carlists who fled from the country since the 1st day of February to return to Spain, if they do so within forty days. Leaders must first swear allegiance, but all Carlists who formerly held offices in Spain are excluded.

The newspapers announce that Gen. Mollins has been ordered to request the French Government to expel all Spanish Republicans in France.

At Ottawa, Canada, March 9, in the Committee on the Depression of Trade, Mr. Drummond of the firm of Redpath & Co. of Montreal said American drawbacks had led to the partial closing of their sugar refinery since 1871.

THE SEASON, CROPS, PRICES, ETC.

Dunnsville, Essex Co., Va., Feb. 29.—This, the last day of the winter months, ends the warmest and driest winter for many years in this section. To-day the dust is disagreeable, though not very windy for this season. Peaches and apricots in full bloom—very unusual for this section. Wheat in good land looks very fine; some is six inches high. Clover first-rate. Farmers who do their own work are well advanced; hired help very scarce. Very little ice in this section put away for summer. We shall have to rely on our springs and wells for cold water. Money scarce and times hard, yet we made a good crop of wheat and corn last year, the best for five years. Wheat, $1.20@1.50; corn, 50@60c.; freight to Baltimore, 6c. per bush. by steam or sail vessel, where we find a ready market for the farmers' products. Land is at this time rather dull, but some is sold at from $5 to $40 per acre, as to quality and location, with improvements and convenience for transportation considered. Farm hands, $10@15 per month and board, and generally houses furnished for hands with families.—R. S.

Vermillion, Clay Co., Dakota, Feb. 29.—The winter has been one of the pleasantest I ever saw in any country. We have had no rain since last October, and not over three inches of snow this winter. It was thought for a long time our ice crop would be short, but this month is the coldest of the season. Geese have made their appearance once more. Farmers will soon commence sowing wheat. Crops were tolerably good; would have been splendid if it had not been for the heavy rains we had about harvest and stacking times; about half of the small grain was more or less injured. Corn crop was never better; more corn was raised here last season than ever before, and hence the price is low. Very few hogs to consume the surplus. Hay in abundance; every one thought hay would be scarce, and plenty was put up, so that much will be summered over. Horses range in price from $90 to $150; work oxen, $75@120; cows, $25@35; beef cattle, $2.50@3.00 per cwt.; dressed pork, $5.50@6; butter, 10@20c.; eggs, 10c.; wheat, 40@95c.; barley, 20@50c.; oats, 25c.; corn, 18@20c.—H. E. D.

Manistee Co., Mich., March 9.—Weather warm, and spring like. Large preparations are being made for sugar making. Potatoes, 20c.; oats, 45c.; corn, 80c.; butter, 25c.; eggs 20c.—M. E. A.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 11, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	73,820	Molasses	1,404
Whisky	2,426	Rice, bbls	1,232
Corn meal, bbls	875	Cut meats, pkgs	10,827
Corn meal, bags	3,645	Lard, pkgs	9,712
Wheat, bush	178,725	Tobacco, hhds	1,500
Corn, bush	147,751	do. cases	37,919
Oats, bush	268,587	Butter, pkgs	17,229
Rye, bush	320	Cheese, bxs	20,179
Malt, bush	31,559	Cotton, bales	22,866
Barley, bush	28,100	Rosin	3,014
Beans, bbls	18,932	Spts. turp., bbls	799
Grass seed, bags	10,684	Dried Fruits, pkgs	401
Beef, pkgs	1,481	Eggs, bbls	17,168
Wool, bales	465	Pennuts, bags	502
Hops, bales	2,019	Dressed Hogs	2,508
Pork, bbls	4,035	Leather, sides	86,267
Tallow	854	Oil Cake	8,009

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise, many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else.

BEANS AND PEAS.—Exports of beans past week, 2,756 bbls.; since Jan. 1st, 12,423 do.; same time last year, 4,780 do. Exports of peas past week, 7,366 bush.; since Jan. 1st, 190,815 do.; same time last year, 102,773 do. Enormous receipts of beans continued to depress quotations, especially for the large stock of mediums. Prices are off a shade without leading to much business. Marrows have sold freely to exporters at easier quotations. Sellers are willing to make concessions in almost every instance, in order to unload the pressing supply for the season. Pea beans nominal; kidneys and limas dull and favoring buyers. Canadian peas quiet and lower. Green peas are also off for wholesale parcels. Split peas quoted at $6, free, in bbls.

We quote Beans, pea, new, prime, $1.35@1.40; other, $1.15@1.25; medium, new, prime, $1.20@1.25; good, $1.05@1.10; very poor, 50@80c.; marrow, new, prime, $1.65@1.70; other, $1.40@1.50. white kidney, prime, $1.70@1.75; fair to good, $1.50@1.60; red kidney, new, prime, $1.40@1.45; fair to good, $1.20@1.30; California Lima, choice, $2.10@2.50. Peas, Canadian, bbls., new duty paid, $1.16@1.17; bulk, in bond, 90@97c.; green now, ₱ bush., $1.55@1.60; Southern B. E., ₱ 2 bush. bag, $2.80.

BEESWAX.—Bleachers want choice lots, for which they pay advanced rates. Western quoted at 32½@33c., and Southern at 33½@34c. Exports past week, 3,740 lbs.; since Jan. 1st, 27,300 do.; same time last year, 23,350 do.

BROOM CORN.—Prime lots are in light stock and at full prices. Medium grades are plenty and dull.

We quote Brush, short green, 9@10c.; hurl, green, 8½@10c.; green, medium, 6@7c.; red and red-tipped, 3@4c.

BUTTER.—The late supplies show that the reserve of State is dwindling to the end. The fact that all of the stock will soon be located, inspires a great deal of life in the market. Buyers of liberal quantities now feel that it will be economical for them to carry a portion above their recent line of purchases, as they can thus protect themselves from an excited growth in quotations that might occur when the supply becomes centered. This feeling has run out a good many parcels of under-grade stock, that was expected to drag this spring. Fresh butter will come none to soon for the fancy retail trade; the old is a scarce commodity, and for the very extra half tubs sellers have prices pretty much their own way. In some portions of the market sellers have begun to advance the quality of grades but buyers do not respond in prices as there are free sellers at quotations. Western butter is doing very well. Much of it fine enough to run close to 30c. There is a rumor that several car-loads of new California stock is on the way. It is thought that new milk stock will appear next week.

State dairies entire, extra, 34@35c.; entire, good to prime, 30@32c.; fair to good, 27@30c.; firkins, selected fresh, 33@34c., good to prime, 28@32c.; fair to good, 24@28c.; half-firkin tubs, selected, 37@40c.; good to prime, 33@35c.; fair to good, 28@33c.; poor to fair, 18@27c.; State, Welsh, tubs, fall made, 28@32c.; dairies, 25@30c.; good to prime, 31@34c.; fair to good 24@26c.; poor to fair, 18@24c.; Pennsylvania, store packed, 18@26c.; Western, dairy tubs, selected, 28@29c.; good to prime, 25@27c.; tubs selected fresh, 27@28c.; good to prime, fresh, 24@26c.; fair to good, fresh, 21@24c.; poor to fair, fresh, 17@20c.; Western, early packed, selected, 23@25c.; good in lines 20@22c.; fair in lines, 18@19c.; poor, 15½@17½c. Roll butter, Mich. & N. Ills., fancy, 27@29c.; good to prime, 25@26c.; fair to good, 23@25c.; poor to fair, 20@22c.

CHEESE.—There has been very little doing this week, and some few parcels have been obtained at easier figures, with the general market scarcely steady.

New State factory, fancy, 13¾@14c.; fine, 13@13½c.; do. good to prime, 12@13c.; fair to good, 10@12c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12½@13c.; good to prime, 11@12c.; fair to good, 10@11c. Western factory, cheddar, fine, 13¾@13½c.; good to prime, 11@12c.; flat fair, 8@11¾c.; poor to fair, 7@8c.

COTTON.—For spot cotton there has been an improved export demand, while in "futures" the business has been liberal, with prices higher and strong. The closing prices are for March, 13c.; April, 13½c.; May, 13 13-32@13 7-16c.; June, 13 21-32@13 11-16c.; July, 13¾@13 29-32c.; August, 14 1-32@14 1-16c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.		*Alx.*		*Orleans.*		*Texas*	
Ordinary	9	3-16	9	3-16	9	3-16	9	3-16

Strict ordinary	10 7-16	Middling	11 13-16

DOMESTIC DRIED FRUITS.—Apples are moving off moderately in small lots at about steady prices. Peaches hold firmly but very dull. Blackberries are depressed and easier.

Apples—State, sliced, 10@10½c.; quarters, @9c.; Western quarters, 8½@8¾c.; southern sliced, 1875 crop, 10@10½c. for prime. Tennessee qrs., 8½@8¾c. Blackberries, new, 11@12c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12@12½c. for halves, and 10@11c. for quarters. Plums, 20c. Raspberries, 27c. Cherries, 21@22c. Peaches peeled, new process, 20@23c.; do. unpeeled, 12@13c.

EGGS.—The market has steadily declined to the present rates, which have ruled since Thursday last. The demand is daily improving, but the heavy receipts and supply on hand form a check to early advance. We quote:

Jersey, single barrels, ₱ bbl., 16½@17½c.; State & Penn., 16@16½c.; Western, prime, 15c.; fair marks, 15@15½c.; State, 12@14c.; Southern and Southwestern, 15@15½c.; limed nominally at 10c.

ESSENTIAL OILS.—We hear of no change. We quote:

"H. G." oil peppermint, $4, in glass; Hale & Parshall do., $4@4.20 do.; pure in tin, $3.50; sassafras, 55c.; wintergreen, $3.13; spearmint, $3.50; pennyroyal, $4.

FEATHERS.—Market strong. Western live geese quoted at 55@56c.; mixed, 35@45c. Poultry feathers not wanted.

FLOUR.—There has been a dull and unsatisfactory market, under dispatches from abroad of a weak market there; towards the close showing a slight improvement.

Superfine State, $1.00@4.50; extra do., $4.85@5.60; superfine Western, $4.00@4.50; extra do., $4.85@5.75; No. 2, $3.35@3.85; extra round-hoop Ohio, $4.90@5.25; trade brands do., $5.30@7.25; white wheat extras, $5.80@7.00; St. Louis, $5.25@9.00; City Mills extra, $5.00@6.50; Southern at $4.@4.60 for superfine; $4.75@6.15 for poor to choice shipping extras; $5.25@8.75 for trade and family brands. Corn meal—Western yellow, $2.65@3.15; Jersey & Penn., $2.70@3.25. Brandywine, $3.40. Buckwheat selling at 60@62c. for prime State, and flour at $1.85@2.25.

FRESH FRUITS.—Exports of apples past week, 17 bbls.; since Jan. 1st, 3,901 do.; same time last year, 10,101 do. There is a good inquiry for apples and the better prices are supported. Cranberries are firm. Florida strawberries sold at $2.50@3 ₱ qt. Grapes are in remarkably fine order for the season. Peanuts in better demand.

Apples.—Spitzenbergs and Baldwins, fine, $4@4.50; Greenings, —@—; mixed, good, $3.25@3.50; other $2.50@3. Cranberries—Jersey, choice, bush. crates, full measure, $4.25@4.50; good to prime, $4@4.25; made lots, $12.50@13.50. Nuts—Peanuts, Virginia, 1.55@1.65; do. Wilmington, $1.30@1.90; do. Tennessee, 95@$1.10. Pecans, 12@13c.

FURS AND SKINS.—Market for the moment only nominal. We quote prime skins:

Bear, Northern, as to size and quality	$10 00 to 15 00

Sheep skins, winter	1 50 to 2 00
Skunks, prime black, No. 1, cased	— to 1 30
Skunks, prime black, No. 1, open	— to 1 00
Skunks, prime one-half white streak	50 to 80
Skunks, whole streaked	15 to 20
Wolf Skins, mountain, large	2 00 to 3 00
Wolf Skins, prairie, prime	75 to 1 25

GRAIN.—Wheat has been weak in price, but closed with some assurance under a renewal of export purchases. Latest sales at $1.21@1.25 for No. 2 Milwaukee spring in car lots; $1.35 for mixed prime No. 1 Minnesota spring in store; $1.13@1.11 for No. 3 Milwaukee spring of fresh receipt, afloat; $1.03@1.08 for rejected spring; $1.08@1.20 for ungraded spring; $1.36 for No. 1 white Canada in bond; $1.22@1.45 for winter red and amber; $1.35@1.50 for white; $1.28@1.37 for No. 1 spring. Rye at 85c. for State, and 82@83c. for Penn. Barley dull at $1.07½@1.12½ for No. 2 Canada; $1.20@1.25 for No. 1 do. Barley malt at $1.12½@1.35 for Canada; 90c.@$1.05 for two-rowed State, and $1.05@1.15 for four-rowed do. Corn is in large supply and lower. Sales at 62½@63½c. for mixed Western; 64c. for white Southern; 60@63¼c. for yellow Jersey. Oats are lower and dull. Sales at 44@47½c. for mixed Western; 48@52c. for white Western and State; 45@47½c. for mixed State. 46½@47c. for New York light mixed.

HAY AND STRAW.—There has been a fairly active business on export and home trade account, with arrivals moderate and prices well maintained.

Bale hay is quoted:—Shipping, 75@80c.; retail qualities, 95c.@1.10; clover, 60@70c.; salt, 65@75c. Straw is quoted at $1.45@1.15 for long rye; 80@85c. for short rye; 75@80c. for oat.

Exports past week, 140 bales; since Jan. 1st, 5,619 bales; same time last year, 6,736.

HIGHWINES.—Selling at $1.03½.

HONEY.—Dull at 18@22c. for white clover in glass dark and strained, 10@12c.

HOPS.—There is a liberal business in progress, and a further advance is fairly quotable, with an upward tendency. Arrivals have been larger than anticipated, but they comprise few lots of strictly choice. We quote:

N. Y. State, 13@19c.; Eastern, 11@17c.; Wisconsins, 11@17c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias, 17@20c.

MAPLE SUGAR.—Receipts are steady but dull. The large remnant of old promises to interfere with new more seriously than usual. We can hardly expect high prices after the fate that has attended honey. New sugar ranges at 12@13c.; good old, 10@12c.; common do., 8@9c.

MILK.—The price paid to farmers for February was 4@4½c. ₱ quart. Trade at the platforms has been poor; last week's sales, $1.50@2.25 ₱ can of 40 quarts, with much left over unsold.

POULTRY AND GAME.—There is an easy feeling in poultry, the weather is bad for holding, and holders are forced to make quick sales. Frozen poultry is quoted at 16@17 for turkey and 12@13c. for chickens. Philadelphia or south Jersey and Bucks Co. fancy dry-picked chickens sell at 20@22c., large capons at 20@23c., and small capons and slips at 21@25c.

Chickens, Bucks Co., good to prime, 17@18c.; Jersey, good to prime, 15@17c.; State, good to prime, 14@16c.; Western, good to prime, 13@15c.; fair to good, 11@13c.; poor, 9@10c. Turkeys, Jersey, good to prime, 17@18c.; State, good to prime, 15@17c.; Western, good to prime, 14@17c.; inferior, 10@12c. Ducks, Jersey, good to prime, 20@22c.; state, good to prime, 18@20c.; Western, good to prime, 17@19c.; fair to good, 15@18c.; poor, 12@13c. Geese, Jersey, prime, 13@14c.; State, good to prime, 11@13c.; Western, good to prime, 10@12c.; do., poor to fair, 8@9c.

Live poultry is in rather heavy supply and is tending lower. Quality not first class. We quote:

Turkeys, Jersey, ₱ lb., 14@15c.; do. Western, 14@15c.; Geese, Jersey, ₱ pair, $2@2.50; do. Western, $1.25@1.50; ducks, Western, ₱ lb., 65@75c.; ducks, Jersey, ₱ pair, $87@1.25; fowls and chickens, State and Jersey, ₱ lb., 13@14c.; do. Western, 12@14c.; roosters, 7@9c.

Game is reduced to few items. Wild ducks sell well, and pigeons are wanted. We quote $1.50@1.75 for Southern Canvasback, 70@87c. for Western Redhead and 40@60c. for Mallard; wild pigeons, feathered, ₱ doz., 3@3.25; English snipe, $3.50; plover, $3@3.25; hares, ₱ pair, 20@30c.; rabbits, 35@45c.

PROVISIONS.—Hog products generally have been well sustained in price, with a fairly active export trade. Mess pork is quoted $22.75@23 for spot lots, $22.87½ for March, $23.05 for April, $23.15 for May, $23.30 for June, $23.50 for July; dressed hogs at 9¾@10c. for Western; bacon at 12½c. for Western long clear, 13c. for city do. Lard—Western steam: at 13-05c. for spot, 13-07½c. for April, 13-87½c. for May, 14c. for June, and 14-10c. for July. Stearine at 14½c. for choice. Tallow at 9c. for prime. Beef hams at $24@26. Beef—New extra mess at $13@13.50; do. plain mess, $12.50; new tierced at $23 for prime mess, and $25 for India mess. City extra India mess, $32@32.50. Old extra mess, $11.50; 10.50 for plain mess; packet, $15.50@16.

SEED.—Clover is stronger and fairly active; prime State, 14¾@15c.; prime Western, 14¾c.; prime Canada, 14½c.

TOBACCO.—There are large arrivals of Western leaf, prices for which are depressed, with export trade slow. Seedleaf is without change.

KENTUCKY LEAF.—OLD CROP.

	Light. Cents.	Heavy. Cents.
Common lugs	6 @ 7	7¼@ 8¼
Good lugs	7½@ 8	8¼@ 9¾

VEGETABLES.—Exports of potatoes past week, 3,752 bbls.; since Jan. 1st, 37,424 do.; same time last year, 25,252 do. Exports of onions past week, 645 bbls.; since Jan. 1st, 4,196 do; same time last year, 1,118 do. Potatoes are dull, even with low prices for the best lots offering. This of course gives the inferior lots a very poor outlet. Bermuda potatoes quoted at $6 ₱ bbl., which is cheap for opening figures. Bermuda tomatoes, $3 ₱ box of 5 quarts. Bermuda beets, $2 ₱ crate. Florida peas sold at $3 ₱ bush.; they were not in as good order as the first shipment. Prime would bring $5 to-day. Southern green stuff, such as spinach and kale, is in good demand. New cabbage, however, is not wanted; old is plenty and good.

Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.25@1.37; Prince Alberts, $1.00@—; common, 60@75c. Sweet potatoes, $2.50@3.00. Cabbages, ₱ 100, $4@5; red, $6@10. Squash, Marrow, bbl., 75c.@$1; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@3.00. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00. Baltimore spinach, ₱ bbl., $2.50@2.75. Kale, $1@1.25.

WOOL.—There has been a very dull market this week, and easier prices have been accepted on some few lots, with a generally weak feeling. Manufacturers find a slow sale for their goods, notwithstanding the concessions in prices made.

MILCH COWS.—Trade fallen off and quality also; 16 cows sold at $32@60 ₱ head; 11 at $50@70; 9 at $55@75; 5 at $69@81—calves always included.

VEALS AND CALVES.—Trade very slow in coarse quality meal-fed calves at 5@7½c. ₱ lb.; grass calves generally held on sale. Smooth quality veals free of sale at 8½@11c. ₱ lb.; State veals, 8½@11c.; Pennsylvania, 10@10½c.; Jersey, 9½@10¾c.

SHEEP AND LAMBS.—Trade slow with a fractional reduction in prices. Monday sheep sold at 5¾@8½c. ₱ lb.; lambs, 7½@8¾c.; spring lambs, $12 ₱ head. Wednesday, sheep, 6@7½c. Thursday, trade slow; sheep at 5¾@7¾c. Friday, the markets closed weak at 5@7¾c. Virginia sheep sold at 6¾c.; State, 5¾@8¼c.; Michigan, 6¾@8¾c.; Illinois, 6@7½c.; mixed flocks Ohio and Michigan, 7c.; Ohio, 5¾@8c.; Missouri, 6¾c.; Indiana, 7@8c. The lambs in hand were all quoted from New York State.

HOGS.—There have been no live hogs on sale during this past week. City dressed weak and slow at 10¾c.; Western dressed also slow of sale at 10@10¾c.

HORSE MARKET.—City trade fair in fair quality roadsters, with moderate trotting action; 19 head of such like horses sold at $215@425 ₱ head; 3 trotters, $500@1,200; 2 pairs stylish carriage horses, $1,200@1,300 ₱ pair; 9 pair family carriage horses, $300@650; 11 head coarse quality heavy draft horses, $190@215 ₱ head; 2 pair choice quality do., $400 ₱ pair; 10 head Norman cart horse stallions, $1,000@2,000 ₱ head. Sixteen horses arrived ₱ Erie Railroad, via Oak Cliff Station.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., March 11, 1876.

THE market this week has been very active, and quite a number of offerings were made by the factories. The sales embrace lots of fall and winter cheese from the Old Fairfield, Brockett & Feeter, Columbia Center, Arnold Bros., Small's Bush, Palatine Bridge, and others. The prices paid ranged at 12@13c. The Fairfield Association and some others holding the September make are asking 14c., which is at present above the views of buyers.

A number of farm dairies was on delivery and sales were made at 9@12c., according to quality. We hear of some farm dairies that are holding large lines of good cheese at 12½@13c.

Cows are now coming in milk and factories are commencing operations.

There was a large delivery of butter and over 100 packages were sold. Winter butter brought 24@27c., according to quality, and fresh new milk butter ranged at 30@33c., only one or two fancy packages bringing the latter figure.

We have advices from Europe to the third week of February. Our London correspondent says:

Fine English cheese only is saleable, American taking the place of secondary. American of September make is in good demand; as also good, sound, intermediate qualities, if not strong and old. The prices are as follows:

American extra, 65@68s.; fine, 62@64s.; good, 56@60s.; common, 50@56s. English cheddar brings 80@96s.; Wiltshire double, 72@80s.; Cheshire medium, 46@64s.; fine, 76@84s.; Scotch, 70@78s., and Edams at 70s. ₱ cwt.

Fine and good intermediate butter is in demand, but oleomargarine is preferred to stale and rank varieties of butter. The quotations are:

Jersey sells for 140s.; Dorsets, 160@170s.; Danish and Swedish, 170s.; Normandy extra, 104s.; American and Canadian, 90@120s. ₱ cwt.

Oleomargarine or artificial butter brings 70@110s. ₱ cwt.

A MEDALLION bust of the poet Keats was uncovered at his grave in Rome, Italy, on the 21st of February, the anniversary of his death. During the ceremony Minister Marsh planted a eucalyptus near the grave.

BISHOP BEDELL, who is now traveling in Egypt, has sent a cinerary urn, taken from a Greek tomb near Alexandria, to Kenyon College at Gambier, Ohio. It contains some of the ashes found in it when disentombed.

A STRANGE old bibliopole died in Vienna a short time ago. He conducted an eating house, waiting personally upon his customers, and yet he collected a library of 21,000 volumes, many of them editions of rare value.

QUEEN VICTORIA has informed Lord Dufferin that she will assist in the projected improvements in Quebec by presenting the city with $50,000 for the construction of one of the proposed city gates, the one for which it is used to be called the Kent gate.

AN edition of the doubtful plays of Shakspeare is to be collected and published in London shortly. It will include "The Two Noble Kinsmen" and "Edward III.," in the composition of which some authorities hold that Shakspeare took part at least.

THE King of Belgium has just enriched his private collection by a sketch of Rubens, representing Christ triumphing over sin and death. It was the last of a series executed by Rubens to serve as designs for the tapestries of the Count Olivares, the other sketches being in the Museum of Madrid.

Sewing Machines.

"GENERAL FAVORITE"

No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

Trees, Seeds, Plants, &c.

MOORE'S RURAL NEW-YORKER is an excellent Agricultural paper, and very popular. As a family visitant it is hard to beat in the attractions it holds forth for young and old. We are pleased to see that Mr. MOORE is full of his old enterprise and bent on making the paper better and better from year to year.—*Yates Co. Chronicle.*

NEWS CONDENSER.

— Melons were found originally in Asia.

— Salem, Mass., wants a harbor master.

— A colony of Icelanders has settled in Manitoba.

— The Spanish army is to be reduced to 200,000 men.

— In Virginia City, Nevada, there are 300 ex-convicts.

— Chicago has an elm tree that is reported to be 100 years of age.

— The office of Deputy Collector of Customs in Lynn, Mass., is abolished.

— One county in Illinois sold its peppermint crop last year for $500,000.

— A Norwegian expedition to the Arctic seas will start early this spring.

— The tower of the new Yale College chapel will contain a chime of bells.

— Salisbury has petitioned for relief in rebuilding the Newburyport, Mass., bridge.

— There were 42,000 exhibitors at the Paris Exposition of 1867, and 24,000 at Vienna.

— The Newburyport, Mass., horse railroad averages a thousand passengers a day.

— Envelope makers and stationers are petitioning for the abolition of the postal card.

— A pine tree was recently cut on the Menominee river, Wisconsin, that scaled 4,490 feet.

— A man in Northampton County, Pa., has contracted to ship 75,000 school slates to Japan.

— The conversion of several Jews in Washington to the Christian religion causes a minor sensation.

— Ruddock's shoe factory in West Newbury, Mass., employs 160 hands, and is driven with orders.

— A lump of crude iron was recently rolled into a leaf so thin that four square inches only weighed one grain.

— A portion of the Delaware, Lackawanna & Western Bergen Hill tunnel caved in March 4. No one hurt.

— There will be thirty-two of the Governments of the world represented at the Centennial, besides our own.

— There are 28,000 persons employed in watch making in Switzerland, of which number one-third are women.

— Much valuable information is expected from the "Spontaneous Combustion in Coal Commission" now sitting in London.

— When oranges were first introduced into Germany the pastors were opposed to them as "refinements full of danger."

— Glasgow claims to be the second city in the British Isles. It has a population of 547,598, against the 473,405 of Liverpool.

— It is a curious fact that while the names of all our animals are of Saxon origin, Norman names are given to the flesh they yield.

— The Patent Office at Washington during its business hours last year granted patents at the rate of one every twelve minutes.

— An Indiana workman claims to be the fastest cigar maker in the Union. He has made 18,000 cigars in a month, and says he can make 30,000.

— South Kingston, R. I., can't exactly be called a growing town. The population is only 109 more than it was in 1790, and is 477 less than it was in 1860.

— An extensive vein of amethyst has been found near Monticello, Ga. Some of the stones are very large and brilliant, and sell for $100 a pound.

— The Connecticut Baptists have raised $25,000 toward their proposed Centennial Fund of $100,000, besides several large subscriptions which are promised.

— Beverly, Mass., claims to be the port whence sailed the first naval vessel under colonial authority, and therefore the first naval vessel in the United States.

— According to Dr. Punshon, the income of the Wesleyan Missionary Society was in 1820, £33,695 and 148 missionaries; 1872, £184,039, and 1,228 missionaries.

— In Livingston County, Ill., the roughness of the roads has almost entirely suspended teaming in some localities. A third of the corn crop stands in the fields unhusked.

— A Parliamentary return shows that the funds expended in England since 1840, in amounts above £500, in building and restoring churches, amount altogether to £26,000,000.

— Almond culture has recently been the subject of experiments in Santa Clara County, California, and it is stated that it can be carried on there with remarkable success.

— A petition to amend the charter of Lynn, Mass., so as to place the appointment and oversight of the police in the hands of commissioners, is now before the Legislature.

— They have got a boy in Binghamton five years old, who is physically perfect, healthy, talks distinctly, is very active, and weighs only nine pounds. He is twenty-three inches high.

— A Philadelphia firm estimates its sales of flags on the 21st of February at $500 an hour; and it was also estimated that $200,000 worth of stars and stripes floated in the city on Washington's Birthday.

— Official reports show that during the past month the operations in South Carolina by the mounted force under direction of Major Jacob Wagner, the revenue agent, have resulted in the breaking up of thirty-three illicit distilleries.

THE cause of woman suffrage—Scarcity of husbands.

WESTON is spoken of as a man who has two soles and a single thonght.

A BOOKSELLER lately advertised that he had plenty of scarce books for sale.

A MICHIGANDER, who was arrested for stealing a goose, said he found the bird hissing at the American flag and arrested it for treason.

"REMEMBER," said a trading Quaker to his son, "in making thy way into the world a spoonful of oil will go further than a quart of vinegar."

A HANDKERCHIEF of William Penn is to be on exhibition at the Centennial, and a curious correspondent writes to ask if it is the original Penn wiper.

"WHAT is conscience?" asked a schoolmaster. "An inward monitor," replied a bright little fellow. "And what is a monitor?" "One of the iron-clads."

A YOUNG man asked his bachelor uncle: "What advice would you give a young man who was contemplating matrimony?" "I should advise him to keep on contemplating it."

Forward and loquacious youth:—"By jove you know—upon my word, now—if I were to see a ghost, you know, I would be a chattering idiot for the rest of my life." Ingenuous maiden—"Haven't you seen a ghost."

"COME, wife," said Will, "I pray you devote
Just half a minute to mend this coat,
Which a nail has chanced to rend."
"'Tis ten o'clock," said his drowsy mate.
"I know," said Will, "it's rather late,
But it's never too late to 'mend.'"

"ZACHARIAH," said Mrs. Chandler, "what smell is that?" "Cloves." "But that other smell?" "Yes—apples." "And just one more?" "Cider, my dear." "Well, Zachariah," said she, "If you'd only drink a little brandy now you'd make a good mince pie."

WHEN a man wants a plug of tobacco, the grocery three-fourths of a mile off is only a step; but if his wife wants a drink of cool water from a neighbor's well opposite, by some mysterious agency that well suddenly becomes removed more than half a mile away.

"Our one-horse driver takes no care
To look up the struggling passenjare;
So when we wish to stop a cair,
After shaking in vain our umbrellaire,
And yelling again and beating the air,
We hire a boy to run round the cair
And tell the driver to stop his cair
If he wants another passenjare."

"WA'AL, yes," said the old man, as he painfully leaned on his cane, "I am kinder agein', and I feel it more and more every day. Only last year I used to be able to walk round Union Park every morning, and now my rheumatiz is so bad that when I've got half way round, all I can do is to turn round and hobble back."

"HALLO Pat! What's the matter? Is there anybody ill here?" said a gentleman to an Irish laborer, who was engaged laying tan in front of Fishmonger's Hall. "No, sir," replied Pat, "there's nobody ill just now, but there'll soon be a few fit patients for the hospital. There's to be a moighty foine dinner here this evening."

THE American Chemist affirms that "when benzoyinaptylilamide is treated with nitric acid, two isomeric mononitrobenzoylnaphtylamiden are formed. By the action of hydrogen upon these bodies are obtained different products. One yields mononitrobenzoylnaphtylamide and the other anhydrobezodiamtdonaphtalene." This prescription should be pasted in every intemperate man's hat.

"SIR," asked an attorney, yesterday, of a witness who was testifying in a case of assault and battery, "have you been in this court before?" "Yes, sir," said the witness, "I have been here often." "Ah, been here often, have you?" said the attorney, in a triumphant tone. "Now tell the court what for." "Well," replied the witness slowly, "I have been here at least a dozen times to see you, to try and collect that tailor's bill you owe."

A RATHER pedantic doctor, coming into a drug store, saw on the counter one of the old-fashioned bogus coppers. "Oh, what is this?" he exclaimed, scanning and beginning with the Greek article and using the continental vowel sounds, "*Tor-fair-ell-i-law-laytraw-day*," and then trying to translate; when after a minute of intense suspense, during which several of the loungers gathered around with "suppressed emotions," the plain English burst upon him, "To Facilitate Trade!" and then the loud guffaw burst out, and he burst away from the charmed circle of a moment before as if a bomb-shell had burst under his feet.

EQUAL TO THE EMERGENCY.

Poor! Never mind this little brook, ma. Jump on my back and I'll take you across it in a jiffy!

The Horseman.

THE CLAY HORSE "ANDY JOHNSON."

THE accompanying portrait of this model Henry Clay stallion is from the Spirit of the Times. From the pedigree and description given in the same paper we condense the following particulars which will prove interesting to horsemen:

Andy Johnson is a very dark chestnut, 15.3¾ hands high without white, except a few hairs in his forehead. His sire was Henry Clay, the founder of the Clay family of horses, he by Andrew Jackson, he by Young Bashaw. Andy Johnson was foaled in the spring of 1853, and was bred by Silas W. Spink, near Penn Yan, Yates Co., N. Y. His dam was a dark chestnut, without white, except a few hairs in her forehead, fine coated, thin skin, of blood-like appearance, and of remarkable beauty, endurance and speed. She was by Tormentor, bred in Dresden, N. Y. and Andy Johnson was her first colt. Mr. Spink has always claimed that the dam was in many respects a superiar animal to Old Henry Clay, his sire, and that he has inherited from her, aside from his color, marks, great endurance, and staying qualities, many of the traits and characteristics which have distinguished him, as well on the turf as in the stud. His grandam, on the dam's side, was a Mambrino mare, probably by Mambrino Chief. Andy Johnson early developed great speed while in Mr. Spink's hands, and acquired such local renown by the speed of his get, and his own performances, that Mr. Spink sold him for a large sum of money to Mr. J. B. Murray, who trotted him on Long Island, in New York, and many points, giving him a splendid reputation for speed and endurance. He was sold when sixteen years of age to D. A. Snell of New Bedford, Mass., for $5,500, who kept him as a family horse until the spring of 1874, when he was purchased by Mr. Clark Bell, who sent him to his stock farm at Dundee, Yates Co., N. Y., where he has since remained.

Andy Johnson is a natural trotter, with an open, slashing gait rarely equaled. His stride and reach are enormous. He is very powerful and strong in his action. With splendid limbs and physique, he is perfectly gentle, kind, docile, and it would be quite safe for a lady to drive him. He has a large brain, commanding appearance, especially when in motion, of remarkable intelligence, and is most emphatically, what horsemen properly term, "level headed." While he never had any training or proper handling for development of high speed, he made, many years ago, a record of 2:33 before he was withdrawn from the turf. At his advanced age, he is still perfectly sound, full of fire, force, and vigor, and his limbs are as clean as a four-year-old, while his feet, always excellent, are still models for the most critical observer, and perfect in every respect. Next to his endurance and staying qualities, his feet and limbs are his chief attraction, and he always gives both good to his colts. It was the misfortune of this horse never or rarely to meet in the stud, before he came into Mr. Bell's hands, any first-class mares, but he possesses the rare power of transmitting trotting action to all his colts, even from common and ordinary mares. Mr. Clark of Elmira, N. Y., who has owned more of his get than any one person, says "that out of hundreds of his progeny that he has known in Western New York, he never met one that could not, in his opinion, be made to trot in 3:00 or under. The most distinguished of his get in Western New York, upon the turf, are nearly all from common mares, who had neither speed nor lineage to warrant the cross, notably Joe Hooker, Anthony Wayne, Dispute, Ashland Pet, Lady Thompson, Charlie, owned by O. C. Knapp, and Col. Ellsworth, each of whom can trot under 2:30, though all of them have not records as low as that. His former owner, Mr. Snell, testifies that the same general facts are observed of his get in New England. Although substantially withdrawn from the stud for six years of his life, Andy Johnson has probably produced more trotters that could go in 3:00 and under than any living horse. Now that the cross of the Hambletonians with the Clays is exciting such attention, the mares of his get are eagerly sought for by breeders for use with Hambletonian and his sons, and, notably, his noblest son Volunteer. Mr. Alden Goldsmith has a colt of this cross, out of a mare by Andy Johnson, that he pronounces the best colt he has ever known. Mr. Bell is crossing him to the daughters of Hambletonian, Volunteer, Ethan Allen, Golddust, American Star and to thoroughbred mares. Many of our best judges pronounce Andy Johnson as probably the best of Henry Clay's living sons, and a worthy representative of his illustrious sire.

WEAK EYES.—During the summer, when exposed to the sun through the day, horses often have watery discharges from the eyes. The following lotion will be found to answer in such cases:—Plumbic acetate, one-half ounce; tincture of opium, one-half ounce; rain water, twelve ounces. Wash the eyes three or four times daily.

"ANDY JOHNSON," THE REPRESENTATIVE HENRY CLAY HORSE.

Farm Economy.

THE FARMER'S STOCK IN TRADE.

Prof. S. W. JOHNSON, in his valuable book, "How Crops Grow," says, "Nitrogen, potash and phosphoric acid are, most commonly, the substances whose absence or deficiency impairs fertility, and are those which, when added as fertilizers, produce the most frequent and remarkable increase of productiveness."

Prof. F. H. STORER, in the Bulletin of the Bussey Institution, says, "To maintain the fertility of a field producing successive crops of barley, it should receive an annual dressing of phosphoric acid, nitrogen and potash, in the proportion of 1, 2 and 2½."

GEO. VILLE, the great French experimenter, says, "Nitrogen, phosphoric acid, potash and lime are the indispensable agents for keeping up the fertility of soils and obtaining all kinds of crops."

Prof. STOCKBRIDGE of the Massachusetts Agricultural College, in the Scientific Farmer, says, "We have found by experimenting for four years—feeding plants in plots and boxes—that Nature supplies to most crops all materials in sufficient quantities, except nitrogen, potash and phosphoric acid. These three we must supply."

J. B. LAWES of Rothamsted, Eng., whose experiments have extended over a quarter of a century, says, "The only substances really required in artificial manures are nitrogen and phosphate of lime." His soil is undoubtedly well supplied with potash.

Prof. J. R. NICHOLS, Editor of the Boston Journal of Chemistry, says, in Fireside Science, "Without nitrogen not a stalk of corn nor a blade of wheat can grow. Phosphorus is so essential an ingredient in the food of plants that not one of any kind can flourish without it. Potash holds a most important place in the list of substances consumed by plants."

In view of the foregoing testimony of the highest authorities in this country and Europe, we may regard the farmer as a manufacturer whose raw materials are nitrogen, potash and phosphoric acid, which he must procure in the cheapest available forms and convert, through the agency of the forces of Nature, into valuable animal and vegetable structures. He who buys a farm obtains with the farm a certain amount of those three elements of plants. To make his business profitable and permanent, he must at the same time keep good the supply of nitrogen, potash and phosphoric acid, and sell enough of the finished products to pay expenses and give a fair profit. The amount of his gains depends in part upon his skill in obtaining his stock of plant food. He must be a prudent buyer, as well as a skillful manufacturer and salesman. He must not pay fifty cents, in time or cash, for the nitrogen, potash and phosphoric acid to make 100 pounds of milk, when it can be had for fifteen cents. In other words, he must know all about the sources of supply and be on the alert to secure what he needs at the best advantage. He must also understand the special needs of the crops he raises, that he may know how largely to invest in nitrogen, how much in potash and how much in phosphoric acid. Experience has taught men everywhere that all decayed animal and vegetable substances are efficient fertilizers. From the chemist they learn that the value of a ton of good barnyard compost is found mainly in the 9 lbs. of phosphoric acid, 10 lbs. of potash and 15 lbs. of nitrogen which it contains.

But even though the home supply of fertilizers be carefully kept from waste and returned to the fields, still their fertility must gradually decline through the sale of farm products and the washing of rains, unless something be added from without. Besides, the progressive farmer is not satisfied with a crop of 13½ bushels per acre of wheat, 31 bushels of corn or 100 bushels of potatoes, the average yield in the State of New York. To raise the yield to a point at which farming pays well, the first step must ordinarily be to lay in a larger stock of nitrogen, potash and phosphoric acid. But if every farm needs all its fertility, and if most farms need an increase of fertility, whence shall the supplies come? The time was, not many years ago, when every farmer found an abundance of fuel on his own farm; but now, when, after years of free use and sale, he finds the supply deficient, he turns to the vast coal fields of Pennsylvania for his supply. Again, petroleum has supplanted the home-made tallow dip. In like manner the chemist has shown the adaptation of vast geological deposits, rich in nitrogen, potash and phosphoric acid, to meet the demands of agriculturists for more fertilizers. Guano is one of the best known of these deposits. Chemical analysis has shown that one ton of the best guano is equal in fertilizing elements to fifty tons of good barnyard manure, and the experience of market gardeners, who find it profitable at $70 per ton, gold, confirms the chemical estimate. There has been discovered in our own country an inexhaustible supply of phosphoric acid. President CLARK of the Massachusetts Agricultural College says, "The whole world may come to Charleston, run their ships up the Ashley and Cooper Rivers and take in cargoes of phosphates anywhere along their banks." The material is found in the form of nodules about the size of a man's fist, which contain about 70 per cent. of phosphate of lime, or 32 per cent. of phosphoric acid, seventy times as much as barnyard manure. Another great storehouse of fertilizers, chiefly potassic, twenty-five miles square and twelve hundred feet thick, was discovered, a few years since, at Stassfurth, Germany. Other stores as vast may yet be found. Here and there all over the world are smaller supplies, beds of muck and marl and all the waste and sewage of towns and cities.

Warsaw, N. Y. C. H. DANN.

HOW ONE FARMER IMPROVES HIS SOIL.

MR. T. J. FISHER, having become impressed with the idea that much of his barnyard manure was going to waste, devised the following method of saving it, which he tells in the Maine Farmer: "I know I now make twice the value of manure at my farm that I did by simply throwing it out of the window to take a washing, as is now practiced at almost every barn. After experimenting a few years, I became satisfied that the liquid manure was very valuable and too good to be lost. I at last put under my tie-up a plank reservoir and calked it, and now save the liquids and solids entire from my cattle while at the barn. I never allow them to stand in the yard at any time. In summer, at night, they come up to the barn and go into their stalls as if they meant business. I throw in behind them old pickle, loam, lime, plaster, ashes, dry chip dirt, etc. It all works down and comes out the best of manure. If this plan was generally adopted, we can see at once what we should gain in an agricultural point of view. Such manure as this, when applied to the soil, holds out remarkably well. Green crop plowing I know nothing about, but I think it best to adopt the above plan first. This would assure you better crops to turn in. The most of our farms in the older part of the State would not produce a green crop until the land is first manured. I look upon this as the best and cheapest way our farms can be brought back to productiveness."

Very many farmers have several hundred loads of good manure in the bottom of their barnyards from the saturation it has received by years of filtration from the manure left in heaps in winter and spring. In all cases the bottom of a manure heap, even though only earth, is richer than the coarse and strawy portions which farmers are usually very careful to remove. This fine manure at the bottom of manure heaps is in good condition to use on meadows, and especially on young clover. A few days' work with teams and wagons, clearing out the last remnant of manure in spring, will well repay the trouble and cost in improved crops and greater fertility of the soil. It is not worth while to say anything against the purchase of fertilizers; but certainly no farmer can afford to buy while he does not make the most of the manure made in his own barnyard. In fact, it is this class of farmers who first feel the necessity of increasing the fertility of their farms faster than their best efforts can do it.

RYE AS A GREEN MANURE.

ROOT'S Garden Manual speaks highly of Rye as a green manure, especially for gardeners, or where farmers have not time to wait two years for a clover crop to reach maturity. We have often thought that rye might be profitably sown on all fall-plowed land, if only as a protection for the fine surface soil from washing or blowing in winter. It could also be sown on corn and potato stubble and harrowed in without plowing, and in the spring would often afford a bite of fresh feed earlier than any kind of grass. Of its value as a green manure, Mr. ROOT says:

After trying many different green crops, I am quite certain that for the gardener, and often the farmer, in the West, nothing is so valuable as rye. Its growth is made late in autumn and early in spring, at a time when little else will grow, so that the ground is free for this particular use. In fact, all the tender vegetables are off in time to sow it in September, and the ground is not needed for them again till May, by which time the rye will be as heavy as can be plowed under. Upon the farm, too, it comes in nicely, if the succeeding crop is to be corn, roots or potatoes, and more particularly sowed corn for fodder, for which it seems especially adapted. Even after corn I succeed well with it, sowing it broadcast and cultivating it in, leaving the corn hills standing, as they gather snow and help to protect the rye in winter. I sow the seed thickly—about six pecks to the acre—and early if possible, so that the plants shall stool out before winter, endure exposure better, and make a quicker and larger growth in the spring. When the ground is wanted for planting—usually from May 20 to June 1—we turn it under with a chain. It is often three feet high, and thick as only such a heavy crop can be, but with a heavy chain hung from the end of a whiffletree crossbar to the plow beam with slack enough so that it will drag just ahead of the uprising furrow, it will pull down every stalk into the empty furrow as nicely as it could be laid by hand, and the whole mass buried out of sight. A little practice will soon teach just the amount of slack needed.

My attention was first called to the value of this crop for manure almost by accident. Some years ago, just at planting time, I found myself short of suitable land for still another variety of seed melons, which I was obliged to grow, and I leased ten acres of land upon which a crop of rye was growing. This I turned under and planted to Nutmeg Melon. The occasional straws sticking up gave the field a ragged appearance for a time, but when midsummer drouth was upon us and other fields succumbed, this one looked as fresh and vigorous as could be, and in fruiting it even exceeded the promise its appearance gave. The yield of seed was more than one-half larger than on similar land in good heart, but not green manured. I have practiced it ever since, and always with satisfaction, the results the last season being, on some fields, more striking than in any previous year. Its wonderful efficiency in promoting the yield is due, I apprehend, not only to the available fertility it furnishes, but also to its mechanical effect on the soil, and thus maintaining moisture through our worst drouths.

Of course I would myself, and would recommend others to get every forkful of manure to be had and apply it. And yet, upon the same land, I would, in addition, apply green manure whenever practicable. The labor of applying evenly forty loads of manure per acre is considerable. All this is done more evenly by the green crop. Seed and labor together cost me but $3.50 per acre. I cannot say that it adds as much fertility to the soil as forty loads of manure, but I do say that in our drouthy seasons it produces as great an increase of crop as do forty two-horse loads of good manure. It certainly pays to practice it, and to practice it largely, even on land well supplied with stable manure, as that increases the vigor and growth of the green crop, which is immediately, with addition, returned to the soil.

Field Crops.

GRASS IS KING.

IN an able address of Charles Seymour before the Wisconsin State Board of Agriculture on the 11th inst., we find the following remarks on this important subject. No State in the Union is better adapted to grass and stock-growing than this, and this extract will be found very profitable and interesting to our readers:

British agriculture is almost perfection. Taking the farmers of Great Britain as our instructors, we may derive some valuable hints from their experience. Of the fifty millions of acres under cultivation in the United Kingdom of Great Britain, less than twelve millions of acres are devoted to "white crops" or cereals; while over twenty-six millions of acres are kept in permanent pasturage; six millions of acres under clover and rotation grasses; and six millions of acres devoted to turnips and other vegetables. England, Wales, Scotland and Ireland have about two and three-fourths millions of horses, ten millions of cattle, and over thirty millions of sheep. Repetition of white or grain crops is not permitted. Instead of the old process of resting or testing land by keeping it fallow every fourth year, which was equivalent to the permanent withdrawal of one-quarter of the tillable land from cultivation, the turnip crop, with its broad leaves that shield the soil from the rays of the sun, and with its nutritious roots that are fed, before ripening, to cattle and sheep, is resorted to as the most effectual method of benefiting both land and stock: as biennial plants derive their chief nourishment from the air, and do not exhaust the soil, if used before they ripen.

Forty-two acres in over one hundred acres in England, and sixty-four in every one hundred acres in Ireland are pasture. England imports only five per cent. of meats consumed. The capacity of land when kept up to its utmost productiveness in densely populated countries of Europe is demonstrated in the ability of many tillers of English soil, besides paying heavy rents, to support a large family on the products of six acres of land; and in Germany, two acres of land yielded a similar amount of subsistence; while in France, where the long and narrow ribbon-like farms are cultivated almost as carefully as gardens, the capacity of land has reached Western credulity. The French farmers seem to enjoy great benefits from the culture of the sugar beet; and one farm that is owned by Monsier De Candaine, located on the Touraine, valued at two millions of francs, or about four hundred thousand dollars, with sugar, linen and woolen factories thereon, sends to market annually one thousand head of fat cattle. The annual income of this farm is five hundred thousand francs, or about one hundred thousand dollars. Doubtless, upon investigation, it would be found that beets and oil cake contributed largely to the production of the marketable cattle, while the cattle and sheep contributed to the production of the materials used in the factories; and that grass instead of grain was the commanding crop of that valuable farm.

THE BARLEY CROP.

IT is a mooted question whether barley or oats bring the most money at the present average prices; but we suspect that the most successful farmers will generally give preference to barley almost without reference to this question. Barley is much less exhaustive to the soil than oats. It is also much better to seed with, and, where used as a fallow crop, wheat will usually yield five to eight bushels more per acre after barley. A general impression has gone forth that a great amount of barley will be sown this year, and "the talk" among farmers is that for this season it is better to go into something else. It is impossible to tell much by this test. The better rule is, that if at spring seeding in the West wheat is below paying rates, a good deal of ground intended for spring wheat will go into barley. Owing to improvements in manufacture of spring wheat flour, wheat in Wisconsin and Minnesota is now relatively higher than barley, and the chances are that in the West more wheat and less barley will be sown. It is chiefly in Western New York and a few counties in Pennsylvania that barley divides the spring seeding with oats, for there very little spring wheat is grown. There is, therefore, no reason as yet for expecting surplusage of barley with low prices next fall. The quantity sown in the whole country is as likely to be under as over the average.

Barley needs to be got in the ground very early. We had almost said the earlier the better. It will bear very shallow plowing, and, if the corn or potato stubble is clean, it is possible that a gang cultivator with two horses would fit the land quicker and about as well as the ordinary plow. The barley roots do not strike deep, and it is not worth while to turn the rich soil, which is usually on the surface, to the bottom of a deep furrow. If manure has been plowed under the previous year it is well to plow that to the surface; but, otherwise, shallow cultivation is preferable. As barley roots do not run very far the plant needs richer soil than oats. For this reason barley is much the best spring grain with which to use any commercial fertilizer that you may have to apply. Barnyard manures are, however, usually too fresh and strong in spring and can be better used for corn. What is left the following spring will be in excellent condition for use by the barley crop.

Farmers differ as to whether the two or the six-rowed barley is most profitable. The two-rowed is a larger, plumper berry, and in a dry, hot season will yield the largest crop. It is also later in ripening, giving a chance to get winter wheat out of the way before the barley is ready. The six-rowed barley is ripe fully as early as wheat, and must be cut and harvested at once, whether wheat harvest is attended to or not. Great care needs to be taken with either kind of barley to prevent injury by rains, as the slightest stain impairs its value for malting. The six-rowed barley is most liable to premature malting, as it sprouts more readily than the other. It is in fact every way more capricious, needs a richer soil and better season, and in return brings, as it ought, a slightly higher price in the markets.

VALUE OF WHITE CLOVER.

I HAVE frequently read articles in Agricultural Papers condemning white clover as a pasture grass and also as useless for a Honey Plant. This has never agreed with my experience, as I think it one of the most valuable grasses we have. When I read the article on white clover in the last RURAL, by "A Working Farmer," I was reminded of a few circumstances in my experience that so firmly fixed upon my mind the value of this grass that it will take a good positive proof to the contrary to convince me that it is not a grass of the finest quality. When I was but nine or ten years old my father owned a large farm: a part he rented to a neighbor for a number of years, but this neighbor at the time I was of the above age, sold his effects and went West. We then worked the whole farm. There was one lot of eighteen acres that had been left by this neighbor for a pasture lot without sowing any seed. I well remember going to this lot barefooted after the horses and how I did delight in traveling over the white clover; it was so thick and cool, so soft and velvety that I was loth to leave.

A few years later we had a twenty acre lot that we wanted to cut for hay, but we had a good deal of ground to go over, and of course some of it would get pretty ripe unless we pastured it late to keep it back so it would make good hay. So we turned in the above lot about sixty sheep with their lambs and left them in until some time in June. When we took them out it didn't look as if we would ever cut much hay in that lot, but, when we cut the grass it was as thick as the wool on the sheeps' backs; white clover about a foot high and timothy about two feet, and we took over forty tons of hay off that field. Any one can judge it must have been thick because it was not tall. About the same time, I think the same season, after taking the sheep out of the meadow we turned them in a sixteen acre lot just across the road and kept them there most of the season: they kept it eaten down so close it looked as bare as the road. The next spring my father concluded to plow it up, as he thought the sheep had eaten out roots and all; but by the time we were ready to plow it it began to look so fine we let it be for pasture. But as we had plenty of feed and did not need it, we cut it for hay. I don't remember how many tons of hay we took from the field, but it was a great many of the finest quality of white clover and timothy, about half of each, that I ever saw before or since.

I very early in life came to this conclusion—Keep plenty of sheep and sow plaster and you will have the best of pasture for all kinds of stock, bees included, have first-class hay, fine fat sheep and lambs and a thick, heavy sod to turn under when you want to break up, and a certainty of a good crop of any thing you may put on it, other things being equal. INCOG.

Dairy Husbandry.

N. Y. EXPERIMENTAL DAIRY STATION.

THE project of establishing an Experimental Dairy Station iu the State has been agitated at the various Dairy Conventions for two or three years past. That such a Station, properly conducted, would do much good and advance the Dairy industry of the country, there can be no doubt. We need many exact experiments to settle important questions that are now agitating the Dairy public in regard to the management of stock and the manufacture of milk into salable products. The Dairy Conventions have been of important aid in educating Dairymen in many of the practical operations of the Dairy: but there are many questions which need the trained skill of the scientist to properly settle, and the Dairy interest of the country, now representing a vast capital and an annual product of $600,000,000, would be greatly promoted by a well-conducted Dairy Station, where all needful experiments can be made under the supervision of scientific men.

HOW TO SUPPORT A DAIRY STATION.

Mr. E. W. STEWART makes the following suggestions in regard to the support of such a Station. He says:—"An assessment of one mill on a dollar of product would yield a sum sufficient to establish a Station in every Dairy State. But suppose we examine the Dairy product of New York. This State is supposed to possess 1,500,000 cows, and the product cannot be less than $60,000,000; one mill per dollar upon this sum would keep up the working expenses of such a Station for ten years. Suppose the 1,500,000 cows of New York was assessed each only one cent, it would furnish $15,000, or a liberal working fund. How utterly insignificant the equalized expenses would be upon this great industry.

THE NEEDS OF SUCH A STATION.

Now let us look for a moment at the need of such an Experimental Station. The New York State Census of 1865 gives returns from 133 cheese factories for 1864, employing the milk of 67,034 cows through the season, and the average product of cheese is only 283 pounds per cow.

Prof. WICKSON compiles the returns from 127 cheese factories for 1874 and published in the last report of the Association, by which it appears that the average product of all the cows of these 127 factories was 343 pounds, showing an advance of sixty pounds per cow in ten years—owing mostly, no doubt, to the efforts of the members of the Dairy Associations. But this table also shows that the average of the best dairies of these 127 factories was 433 pounds per cow, and the average of the poorest dairies of the same factories was only 250 pounds per cow, showing an average difference of 183 pounds per cow between the best and poorest dairies in all these factories. What a wide field is here for improvement! What interest needs an experimental school if this does not? What other interest could stand such a wide discrepancy of results? Is it possible to suppose cotton manufacture to exist with a difference of 60 per cent. between the highest and lowest cost of productiveness and all going on, indifferent to the facts in the case. These facts indicate, not that good farming don't pay, but that it is possible to get a living with any kind of farming.

Look at a great cotton factory with its thousand spindles running like clock work, each performing its part and every operator understanding the part assigned to him. Here we see intelligent order and thoughtful care everywhere; the cost of a yard of cloth can be calculated to the smallest fraction. What, let us ask, is the inherent difficulty in placing the great Dairy industry under the same intelligent order and discipline? What a transformation! and what a paltry pittance it would be for each dairyman to furnish the means of running a model Experimental Station, where all the propositions looking to the advancement of the Dairy interest may be thoroughly examined and, if thought worthy, tested.

We need not speak of the Experimental Stations of Germany—they are doing a great work for the advancement of agriculture. These are organized and supported by the Government. In Sweden special schools for instruction in Dairy matters are under Government patronage, and the Swedes have advanced rapidly in their knowledge and practice of Dairy Husbandry; and there can be no doubt that a Dairy Experimental Station established in this State would have a most beneficent influence in promotiug and perfecting the Dairy industry of the country, and thus increasing the wealth and prosperity of our farmers and the nation.

SMALL CHEESES—RESULTS OBTAINED BY MR. HOLDRIDGE.

A FEW years ago, it will be remembered, an effort was made to introduce the manufacture of square cheeses. There has always been a demand for small cheeses weighing from 10 to 15 pounds, and could such be more generally introduced the consumption of cheese would be very largely increased. In England an immense trade is done in small cheeses. They are of various shapes and are sold under different names—as the Edams, the Cheddar loaf, the Stilton, the Gondas, besides the small flat cheeses of Wiltshire and Gloucestershire.

In America but very little attention is given to the wants of consumers in this regard, and many would purchase a small cheese that would not buy in small pieces, because unattractive in shape, to say nothing of the waste from drying and breaking into crumbs which a wedge of cheese always entails. A small cheese may be placed upon the table and it forms an attractive object. This is the English way of using cheese: It is placed upon the table and slices cut from it as wanted. The only table cheese that has come much into fashion among Americans is the Pine-apple; but we are persuaded that if our manufacturers would make more small cheeses of fancy shapes so as to be attractive for the table, the consumption of this article of food would be very largely increased.

Mr. HOLDRIDGE in a recent letter referring to his square cheeses, says:—"I sold my square cheese, the make of the whole season, to Messrs. SAGE BROS. & Co. for 15c. per pound last week. If I had waited perhaps I could have got more. This looks as if 'square cheese' was not altogether a failure. My factory makes up the milk of about 100 cows. I have not had a 'skipper' in my cheese this summer. I have some of my square cheese three years old, some ten years old and some made last year. All seems as sound and nice as can be, and have lost little or nothing in weight. I am saving them for the Centennial exhibition as requested. My patrons feel pretty well, as we have realized two or three cents above our neighbors."

As small square cheeses on Mr. HOLDRIDGE'S plan are more easily pressed than in other forms, we had hoped their manufacture would be introduced at least in sufficient quantity to supply the demand for small cheeses. This it seems has not been effected; but we suppose almost any form of cheese, if the weight ranged from 10 to 20 pounds, would command on an average, two cents per pound more than the usual 60-pound make. It becomes a question therefore, in those times of low prices, whether some of our factories could not find it profitable to enter upon "small cheese" manufacture.

THE DAIRY AT THE CENTENNIAL.

EFFORTS are being made to have a grand exhibition of dairy products at the Centennial, and the committee in charge (appointed by the Dairymen's Associations) has sent out circulars asking contributions from factories and dairymen for carrying out this project.

The following resolution, adopted at the late meeting of the American Dairymen's Association, will explain the work proposed:—"*Resolved*, That this Committee recommend as the best plan practicable for the exhibition of Dairy products at the Centennial that a Cheese and Butter Factory, combined in one building, be erected on the grounds for the display of those products, and that the Convention authorize this Committee to proceed at once to the collection of $10,000 to defray the expense necessary to a complete display."

The Committee was also empowered to appoint persons in the several States to collect money for furthering this interest, and Hon. HORATIO SEYMOUR of Utica, N. Y., was appointed Treasurer, thus guaranteeing that the fund will be properly applied. About $1,000 was pledged at the late Convention at Rome, one factoryman having several factories, representing 2,500 cows, agreeing to give five cents for each cow.

It is to be hoped that all factorymen and dairymen may respond liberally to the fund and thus enable the display of Dairy products to be carried out as proposed. Provision will be made for every factory in the United States to be represented at the Centennial, as well also as farm dairymen. The cheese and butter will be cared for in the best manner and at such times as most suitable the products on exhibition will be sold and the proceeds of such sale returned to the exhibitors. The sales will probably take place monthly and the places of the cheese sold refilled again from other factories, thus giving each factory a place in the Exhibition to show its goods, which are to be properly branded with the name of factory, its location and home of manufacturer.

CHEESE PRODUCT WEST OF THE OHIO.

MR. MORROW of the Western Rural makes a statement in that paper, correcting Mr. L. B. ARNOLD in his estimate of the cheese product of the West for 1875. Mr. ARNOLD, he says, put the cheese product west of Ohio at about five millions of pounds, little of which has reached the Atlantic coast." To this Mr. MORROW replies as follows:—"Our estimate of the cheese product of Illinois, Wisconsin, Minnesota, and Iowa in 1874 was *twenty-five millions* of pounds. This also was President FAVILL'S figures, while others thought it low. For 1875 President SMITH of the Wisconsin Association makes the product of the State 15,000,000 pounds—Sheboygan County alone at 2,000,000 pounds. The sales at Elgin, Ill., during 1875, were nearly 4,000,000 pounds (3,970,000). We have no approach to statistics for 1875: but certainly no one could put the cheese product west of Ohio, thus including Michigan at less than 25,000,000 pounds, while many would think 30,000,000 a low estimate."

To that part of ARNOLD'S statement that "little of the product has reached the Atlantic coast." Mr. MORROW says:—"A large part of the total product was sent East, considerable quantities being shipped direct to Europe." Of course, every one who knows anything about the cheese product of the West, is well aware that it was greatly above 5,000,000 pounds for the past year, and it is unfortunate for ARNOLD, who claims to be an authority on dairy matters, to make such wild statements, as they mislead many as to the actual production and the disposition of our cheese product.

The Herdsman.

EXPERIMENTS IN FEEDING.

FROM an essay read before the Central New York Farmers' Club we quote some suggestive comments on a most important subject:

Starch in vegetables contributes largely to thrift in animals. If starch in the growing plant (carbon, oxygen and hydrogen) is allowed to form into woody fiber, it is lost for nutritive purposes; hence, the superior value of early-cut hay. Good oat and barley straw may be a partial substitute for hay by feeding roots and other succulent food with it. It does not contain the requisites for providing for the wastes of the system in cold weather; hence the importance of comfortable quarters for animals thus fed. I have found by experiment that twenty pounds of early-cut hay, by actual weight, daily fed to each dairy cow will keep her in healthy, thriving condition, when not in milk, and when kept quiet in comfortable stables, while the same grade of cows require during the same time thirty pounds to keep them in equal condition, fed out of doors, with no other protection than a shed to screen them from the cold blasts of winter. In housing forage crops, they should be so packed that either kind or quality may be reached at will to give the stock a change of food. A mixed diet is manifestly better for all kinds of stock. Cutting feed for stock is recommended by many, and has some advantages. When mixed with meal it retains the meal in the first stomach of ruminating animals longer than when fed separately in bulk. Nature has provided in the digestive functions of the ruminating animal, that the first stomach, mingles salivial properties with the food, to facilitate digestion, without which digestion would be imperfect and a portion of the food passing directly to the other stomachs would go to waste. Forage cut and steamed and fed warm is better in cold weather, because steaming helps digestion and preserves animal heat.

But the economy in hiring labor to cut hay and straw to feed alone is questionable. To ascertain the comparative value of early cut hay and soiling corn fed dry for milk and butter in January, I took two cows out of the dairy and fed them alternately on hay and dried corn. The hay was of fine quality, cut the first of July. The corn was cut and dried (not cured) when the tassel was well out of blossom. The two cows were fed sixty pounds of hay per day and the same weight of corn fodder, alternately. They gave in four successive days on dried grass 158¾ pounds of milk, which made 6 pounds and one ounce of butter, or one pound of butter from 26½ pounds of milk; and 167 pounds and 6 ounces of milk in four successive days from the same weight of corn, and 6¼ pounds of butter, or one pound of butter from 27½ pounds of milk, showing 8 pounds and 10 ounces more milk from the corn and only 3 ounces more butter, the quality of milk being in favor of dried grass.

The object to be attained in growth of young animals, in milk for butter, or cheese, for muscle in working animals, or fattening requires varied constituencies in the food they eat. The young animal requires food easy of digestion and ready assimilation, rich in nitrogenous properties and phosphates for the rapid growth of all parts of its body. With the milk-giving races the mothers' milk is adapted to building up all parts of the body of the offspring. Although skimmed milk will make good calves, less of new milk will grow them finer in symmetry and handling qualities. Oat, bean, pea and flaxseed meal, mixed and well boiled, fed in small quantities with milk as the stomach will bear it, is a cheap substitute for milk, and may take its place entirely with good results, when the second and third stomachs are developed to remunerate its plant food. Daily access to fine dried grass or dried corn leaves will hasten development of the rumiuating organs and fit them to do with less milk. In changing from milk no one kind of grain will do as well as a mixture well prepared for easy digestion. All changes in diet should be gradual, and the full capacity of the stomach to digest should not be taxed. Young animals to pay for their keeping, should be well supplied with nutritious food during winter: and have comfortable quarters to screen them from asperities of weather. Oats, wheat, bran and oil meal mixed are good winter food for calves. Apples and roots in proper quantities are also good. Oats need no grinding for calves or sheep, as they grind them closely by ruminating.

It is a fact well established that habits acquired in the early growth of animals are subsequently manifest in their physical constitution. Hence the economy of feeding heifers designed for milking, with food similar to that required for greatest flow of milk, which consists in succulent food nearest allied to milk in constituency. The lacteal glands are developed with other growth of the body, and are large or small in proportion to physical habits acquired from feed. Roots, pumpkins, apples and plant food are most congenial for heifers and cows in milk. Beans, peas and oats have the best analytical record for growth in bone and muscle; rye, wheat, buckwheat and oats, for milk and for cheese; and corn for butter and fat. Barley and buckwheat will fatten swine and horses rapidly, but are poor feed to fatten the bullock, or for butter.

Sheep Husbandry.

ANTIQUITY OF THE SPANISH MERINO.

THE Romans wore nothing but woolen goods. They had no cotton; they had a little linen, which was worn as a material of luxury; they had no silk. They cultivated the sheep with great care, and some of their richest posessions were in sheep. But there was one breed of sheep which they cultivated with great care, and by that system of selection which Darwin speaks of as the source of the perfected forms of our domestic animals. It was called Tarentine sheep, from Tarentum, a city of Greek origin, situated at the head of the Tarentine gulf. The fleece of this sheep was of exceeding fineness; it was of a great delicacy, and the prices paid for it were enormous. The sheep were clothed in cold weather to keep them warm; and the result was that they were very tender, and their wool was very fine. They were a product of Greek civilization transmitted down to the Romans. Columella, the great Roman agriculturist, says that his uncle, residing in Spain, crossed some of the fine Tarentine sheep with some rams that had been imported from Africa; and the consequence was that these animals had the whiteness of fleece of the father with the fineness of fleece of the mother, and that race was perpetuated. Here we see an improvement of the stock, an increase of strength and productiveness given to the fine-wool sheep of Spain. At that time the sheep of Spain were of immense value; for Strabo says that sheep from Spain, in the time of Tiberius, were carried to Rome, and sold for the price of a *talent* (one thousand dollars) a head. In the time of our Saviour, a thousand dollars was given in Rome for a Spanish sheep. When the barbarians inundated Italy, these fine-wool sheep were all swept away; but they remained in Spain. They were cultivated by the Moors in the mountains of Spain, which were almost inaccessible, and were not reached by the hordes of Huns, and other Northern barbarians, which had laid waste the greater portion of the Roman possessions. They continued to be nourished there by the Moors, who were very much advanced in arts, and further on were found there as the Spanish Merino. So that the Spanish Merino which we now have, if not the only, is at all events by far the most important relic that we have to-day which has come down to us from Greek and Roman material civilization. We have here a direct inheritance from the material wealth of the Old World civilization.—*J. L. Hayes, in Live Stock Journal.*

SHEPHERD NOTES.

The Big Fleece.—A great splutter was made a year ago about a large fleece that hailed from California, and weighed fifty pounds. It was handed over to a committee who were to wash it and report. They have done both. It does not pan out very good. With the grease and dirt out there remains about twelve pounds of wool and burrs, the latter in the opinion of the committee weighing two pounds, so that of wool there remained but ten pounds,

Ewes with Lambs should have some succulent food during the latter part of winter. Potatoes or other roots are excellent. If thin in flesh give a very few oats each day. Corn is too rich.

Industrial Implements.

THE BUCKEYE FORCE FEED DRILL.

READERS of the RURAL NEW-YORKER have had well "drilled into them" the advantages of drilling grain rather than sowing broadcast according to old fashioned practices. Very many of our Western readers are acquainted with the Buckeye Force Feed Drill, made by P. P. MAST & Co., Springfield, O., a representation of which is found on this page. It has, we believe, given general satisfaction, and by successive improvements has been brought as near perfection as this kind of implement seems capable of. Among its advantages are the easy regulation of feed, distributing more or less at the will of the farmer and without change of gear. Farmers have long wanted a drill in which the amount of seed can be regulated without putting on or taking off of cog wheels of various sizes, as often in the same field different portions will require more or less seed according as the soil is rich or poor. The Buckeye Drill, being a force feed, will distribute all kinds of grain with equal facility and exactness in any desired quantity. By the improved hoe shifter the hoes are changed from straight to zigzag without stopping the team, relieving the hoes of clods or other impediments when working on rough ground. This is a very valuable feature. The arrangement of the grain tubes is such that they are attached directly to the feeder cups, showing the grain as it falls from the hopper. Thus the farmer can at all times know that every tube is operating and distributing its seed perfectly.

THE BUCKEYE FORCE FEED DRILL.

An increasing proportion of farmers are using and will continue to use concentrated manures—mainly commercial fertilizers with their crops. The best result with these is always by drilling them in with the seed. The Buckeye Drill has a fertilizer attachment operated on the same principle with the grain drill, and distributing evenly any kind of concentrated manure. The advantage of using the fertilizer will alone pay the cost of a drill in many cases. As the fertilizer attachment is a force feed it will distribute manure in any reasonable condition, breaking up lumpy portions and putting them through the tubes. It is also superior for working with damp fertilizers which could not otherwise be evenly distributed.

These same parties manufacture the celebrated Buckeye Broadcast Seeder, Buckeye Riding or Walking Cultivator, Buckeye Plow Sulky, and Buckeye Cider Mill and Press.

The Vineyard.

HIGH CULTURE OF GRAPE VINES.

OF late it has become quite the fashion among a certain class of writers on horticultural matters, to either denounce or sneer at the mode of culture practiced by our grape growers of a dozen years ago.

We are told that high manuring, deep trenching and close pruning are, to use a slang phrase, "played out." But we think the advocates of high culture would come as near the truth as their opponents by saying, "and so has grape culture." Not that grapes have failed to be a success in many localities, or that our markets are fairly supplied with this fruit, such as it is, but grapes of good quality and well ripened are still an exception to the general rule. Perhaps the price which this fruit commands in market, will not warrant any considerable outlay in the way of cultivating the vineyards, or care in pruning, training and thinning out the berries and bunches, but this does not prove that high culture in all its ramifications is something unworthy of consideration.

We find that the cultivators of exotic grapes under glass, still pay great attention to the preparation of the borders, both as regards the proper manipulation and component parts of the soil into which the roots are to be placed, not omitting to give special attention to under-draining. But our would-be-advanced vineyardists, tell us that no such expensive preparations are required for the native grape when grown in the open air, although the half starved, sickly looking vines to be seen in almost every neighborhood throughout the country, show very conclusively that there is something radically wrong in their culture, or no culture at all which amounts to the same thing in the end.

Perhaps it is in the pruning, for those who denounce deep culture and high manuring for grapevines, usually reckon the various systems of close pruning in the same category of injurious and useless processes, that might better be dispensed with than practiced.

But again we must refer them to the manipulation of vines grown in graperies where our five to twenty-five pound bunches are produced, and of the very same sorts which would not grow to one-fifth of this weight if planted in the most congenial soil and climate, and the vines left to take care of themselves, or the bearing canes or spurs pruned a foot or two in length as frequently recommended for vines in a vineyard.

Of course we shall be met with the ever-ready assertion that "circumstances alter cases," and that foreign varieties cultivated where they are subjected to artificial heat, require different treatment than the native sorts cultivated in the vineyard. This is true to a certain degree, but in our own experience and observation we have failed to discover any good reason for such a nice difference in the culture, pruning and training of the foreign and native varieties. We have found no native sort which did not thrive better under the very highest culture and short, close pruning, than the opposite. But whether the product will pay for all this extra care and expense is quite another thing, and does not at all affect the question of the results of scientific or high culture. It has been urged that to tell the novice in grape culture that he must trench his soil 18 inches to two feet deep, mix in plenty of old, well rotted manure, bone dust or other enriching materials before planting the vines, is discouraging, and will prevent many from purchasing vines or attempting the culture of this fruit, all of which we admit is true. But it is not better that he should know this in advance, than to find it out after spending his money for vines, and wasting years of time in trying to get good grapes, in consequence of not knowing what was needed to produce the desired results. We remember the time, and it was not many years ago when almost everybody who had a foot of spare ground planted a grape vine, and in a soil prepared in accordance with the plans laid down by the advocates of high culture, and as a result hundreds of our amateurs succeeded admirably with varieties which are now considered "played out."

It was not unusual then to meet one of our merchants, mechanics, in fact, men engaged in various occupations, who would recount their triumphs in raising magnificent bunches of Delaware, Rebecca, Allen's Hybrid, and similar (as now considered) uncertain varieties. A fair or grape show at the Farmer's or Fruit Growers' Club in this city, was sure to bring scores of these amateurs together, exhibiting, or boasting of the product of his few or many grape vines.

That such exhibitions of the success of amateurs is not so common now as formerly we admit, but do not think it should be attributed to the failure of varieties in consequence of high culture, or to systematic close pruning. There are other causes which have brought about the change and the principal one is the overstocking of our markets with grapes from more favorable and distant localities. When the amateur had to pay twenty-five to fifty cents per pound for only a passably good grape he thought it worth while to cultivate a few vines himself, but a drop to three or five cents obliterates one of the most powerful incentives for spending time and labor over his vines, hence hundreds have ceased taking any special care of their vines.

GRAPE ROT.

THE Alton, Ill., Hort. Society have been discussing this subject. Chas. V. Riley, State Entomologist of Missouri, thinks the rot in the berry may be attributed to some constitutional defect in the vine. Mr. Starr, of Alton, does not believe it due to any constitutional defect in the vine, nor to the mode of preparing the soil, as some believe. J. M. Jordan of St. Louis, a successful cultivator, said:

"I have lost all confidence in the statements of our scientific men. I have seen grapes grow where our scientific men say they can't be grown. I do not disapprove of scientific investigation, but I do disapprove of stating as facts what are merely suppositions. I have grapes growing this year where you could not pick a handful of rotten grapes. I believe I can take any vine and make it produce rotten grapes, or I can make it produce sound fruit, free from rot. Close pinching is the main thing. Keep the foilage in check. The soil should be well under-drained, as I don't think one can grow fruit or vegetables with the feet of the plants in water. The rot this year is extensive, but on under-drained soil, where a careful system of close pinching has been followed, we find the grape nearly exempt, as compared with those vineyards where a different system has been followed.

Insurance Department.

INSURANCE NOTES AND NEWS.

The Use of Kerosene.—Though the ingenuity of inventors and chemists has been severely taxed to devise means to render the use of coal oil and its preparations comparatively innocuous, it is practically a trifle more dangerous to life and property than gunpowder. The laws enacted to regulate manufacture and sale are nearly a dead letter because of the facility of adulteration of the safer varieties of the article. When the crude oil is distilled there comes first the lighter, more volatile and inflammable, as well as dangerous and cheap benzine; next the safer and dearer kerosene of common use, and lastly the heavier oils ordinarily used for lubricating purposes. Various rules have been proposed, and some adopted, for testing this inflammability and explosiveness of the middle grades used for domestic purposes, but these rules are easily evaded. A dealer may purchase a tolerably reliable article for a fair price, and by mixing with it a cheaper variety give better satisfaction, while apparently selling "coal oil" for less than it cost him, than if he had sold the same article he purchased. The user knows nothing of the dangers incident to the use of the cheap but brightly-burning article until an explosion occurs, and is likely to know less thereafter. Aside from the possibility of acquiring skill in detecting adulteration there would seem to be no protective measure except to purchase a high-priced article of a reputable dealer. There is, we believe, a lamp—patented perhaps, we do not know by whom—provided with an extinguishing attachment that puts out the light immediately when the lamp is tilted to one side, which occurs of course when it falls, and as there is no fire burning when the crash comes, there is no explosion. Such an appliance, if effective, promises to be useful, and will doubtless encourage other improvements in the same direction.

Insurance Legislation.—There appears to be a strong tendency to enact laws for the protection of policy holders. There may be some justification and necessity for this in the severe rules and practice of certain companies. There is danger, also, in unskillful and injudicious meddling. The State of Kansas proposes to enact that:—"All the conditions of every policy shall be in as large type as the body of that instrument; that no condition, limitation or restriction..... ...shall be of any force or effect unless the occurrence shall increase the risk or hazard; and that when policies are made payable to others than the insured no act of the insured, after the delivery of the policy and its assignment to another, shall invalidate the claim of such third party or assignee." These enactments, if properly guarded, may be salutary, but another that follows, promises to open the way to limitless fraud. It is "that no policy shall be void on account of false representations after it has been in force six months, and that in case fraud is discovered the company shall return all the premiums." Such a law as this would give a fearful advantage to designing men.

Do Not Forget This.—There are in life insurance, as in morals, certain cardinal truths that cannot grow stale through frequent repetition, and should be remembered only to be acted upon at once. These are—That life insurance cannot bring pecuniary gain to the party insured. For him there is only the consolation of knowing that his family is provided for in any event, This alone is worth ten times the premium. The prospect of dividends should not be an incentive to invest money in insurance policies. There is no profit for the policy holder except the insured dies prematurely. Protection for the family is the only thing worth buying, and security for a fair price the first, last and only condition worth seeking. And this security is to be found only in the tried and substantial corporations that have weathered all the financial storms and remained unaffected by hard times and business prostration. The companies permitted to advertise in this paper, and commended editorially, are such as may be trusted to fulfill any obligation implied by their policies. One thing above all others is worth remembering and that is, that doing business with a company or *society* that has neither corporate existence, capital to be sued and levied upon, nor financial responsibility, a conscientious man tampers with one of the most sacred of all possible responsibilities.

The "Privilege" Plan.—It has long been the custom of fire insurance companies taking long risks upon property, to collect the premium for the whole term in advance. This practice has been found to be inconvenient to all parties. The company is required to pay a large commission in advance, as well as to hold a larger reserve fund in order to meet the requirements of the law, and the insured have to pay a larger sum than the company needs for current losses and expenses, as well as to risk, sometimes, a great deal upon the chances that the company will be solvent during the entire term paid for. The new plan adopted by certain companies, that should advertise this great advantage, obligates the company to carry the risk during several years, but permits the insured to pay annually, as in life insurance, and to cancel the policy in case of dissatisfaction or transfer of the property. We heartily indorse the superior equity of this improved plan, and hope that it will be generally adopted.

Around the Republic.

"DOWN SOUTH."

Diary and Notes of an Ex-Editor Seeking Health.

BY CHARLES D. BRAGDON.

Jacksonville, Fla., Feb. 22.—There was a heavy rain this morning until 10 o'clock, at which hour the Florida Fruit Growers' Association was to meet. It did meet, accomplished a little preliminary business, and, on account of the absence of a majority of the members, adjourned until to-morrow morning.

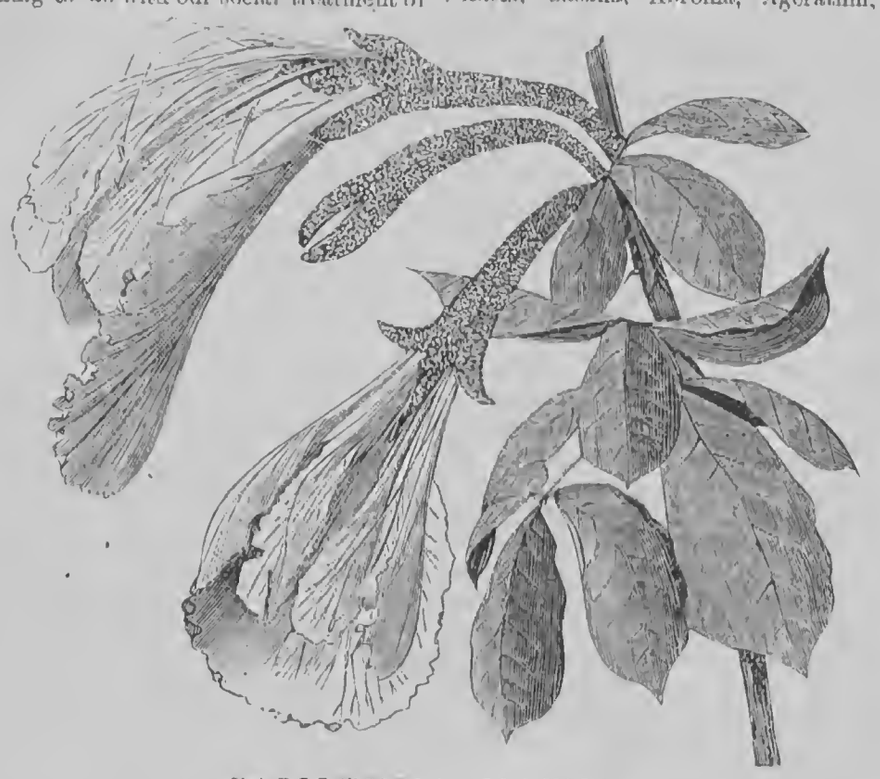
This was to have been the opening day of Florida's first State Fair. About 1½ P. M. I met the Sup't., who told me that but for the rain it would have opened this morning; that if he got 'round in time he should open it this P. M. I "hung around" awhile, but made up my mind that the burthen he was carrying would prevent his getting "around in time," and I accordingly came home. I learned, however, that visitors were admitted, although the distinguished Sup't. was not there to "open the fair."

[A question of privilege.—An officer of this State Fair, while I was quietly eating lunch at a public restaurant, left a group of friends and deliberately walked up to and accosted me as—JOSH BILLINGS! Now I may resemble a gentleman, or a fraud, a burglar, or a politician, a tiger, lion or unicorn, and therefore be like unto JOSH BILLINGS; and I do not know that he has a reputation for being any one of the characters; but I do know that he is reputed to be the worst speller in the universe, and herein lies my grievance. I respectfully submit that if, when I walk quietly through the streets of this City of Sand, I am to be accosted by every poor speller who comes along and given the name of the worst orthographical bummer on the Continent, I must have from the RURAL office certificates of my orthographical orthodoxy to smite such fellows with! I'm tolerably callous, after a newspaper experience of a score of years; but to be mistaken for and actually addressed as JOSH BILLINGS, touches too sensitively my professional pride for me to submit to it without emphatic protest!]

Wednesday, Feb. 23.—This morning at 10 o'clock the Fruit Growers' Association met again, with full attendance. President BISHOP delivered his annual address, all of which I did not hear. That portion I did listen to, seemed to stamp him as a sensible, level-headed man. He was enthusiastic about the future of Florida, but he didn't allow his enthusiasm to effervesce in real-estate-hifalutin. He talked upon one subject which I thought important—the character of Florida soils and the importance of the men of the State who have resided here long enough to distinguish as to quality, educating new comers whose superficial impressions are so often incorrect and unjust to the State. He asserted the existence of a diversity of soils, variously adapted to the growth of various products.

Following Pres't BISHOP'S address delegations of Georgians were formally introduced, welcomed and invited to participate in the proceedings of the Association. Two of these Georgians responded to this welcome. Florida was reminded that Georgia was one of the "original thirteen States" while Florida wasn't; nevertheless Georgia was not too proud to pat poor Florida on the back and proffer her the benefit of Georgia's superior wisdom and more extended experience! Patronizing fellows, these Georgians were to-day! "Information from them?" Oh, yes! The most interesting to the writer was the description one of them gave of the way to treat "Yankees." You should have heard the word "Yankee" sizzle between his teeth as he uttered it. With them, "Yankees," *with money to invest*, were treated with great cordiality and respect, *if they invested it*. This Georgian plumed himself upon the fact that, in his neighborhood, "Yankees" *with money to invest*, were treated about as well as other people and allowed to have political and other opinions. If the "Yankee" was a "Carpet-bagger," or without money, that was altogether a different matter; but if he *meant business, had money and planked it down*, then this generous, lofty-minded, royal Georgian would recommend that he be treated well! Imagine him giving this advice in a blown-out, pompous style, to an Association whose President (who sat politely listening) is a Northern man, and a majority of whose members may be, for aught I know!

Why do I take notice of such talk, thus publicly? Because it is one of the *facts* a Northern man will run against who settles any where in the South among this type of Southern men. Treat us well? As if they were to be commended or rewarded for not treating us ill! I've got heart-sick of these boasts in the RURAL NEW-YORKER and other papers, and in speeches by Southern men, that in certain localities in the South the Northern man is treated and welcomed. Why are these assertions made? A Southern man does not need to be assured that he will be well treated in New York, Massachusetts, Ohio or Illinois. In New York he is treated no better and no worse than a Western or a New England man. His political opinions or idiosyncrasies have nothing to do with our social treatment of him. His rights to life, liberty and the pursuit of happiness, so long as he obeys the laws, are never questioned; or no one thinks of doubting his right to his opinions, of whatever character, and to utter them or not as he chooses. Why then should we commend in the men of any other State what we ask and expect no credit for doing in our own? Why should men puff themselves up like poulter pigeons, for doing in one State what in a sister State is done as a matter of course because it is right to do it? The fact is, when I meet a man who thinks it necessary to boast of his honesty I expect to find him dishonest, or of his gentility, I expect he will prove a boor; or of his friendship I expect to find him as treacherous as JUDAS ISCARIOT is reputed to have been. I take no stock in either the men or the locality, North, South, East or West, that find it necessary to proclaim that they do not skin people alive and throw their carcasses out to bleach and rot like carrion.



CAMOENSIA MAXIMA.

It will probably be recollected that in some of my previous notes I advised men who could bring no money hither to stay at home. To-day Col. Concussion HARDEE made his little speech again before the Convention. It is the same little speech that I heard in Richmond, and have read since wherever it has been reported with variations. The variation to-day was that the Florida Fruit Growers' Association did not do its work as well as it might, last year, because it encouraged Northern men who had no money to come hither and settle on the homestead lands. "We don't want Northern men here without money!" exclaimed the Concussion Colonel with the biggest kind of concussion. He is right too; and it is the kindest thing I can say to a Northern man who has no money, *keep away from Florida*—that is, if he has any intention of coming.

The Col. also insisted that it was important the Association should do something more than it had done with reference to orange culture. He said it was all "at sixes and sevens." No two men would give the same advice concerning it. (By the way, I have scarcely found two persons in Florida who gave the same advice about anything—although it is so plenty as to be a drug on the market), and it was confusion worse confounded. Then the orange belt of Florida ought to be defined. Forty years ago he saw oranges growing 200 miles North of the now proclaimed limit of the orange belt. It should be better defined, &c., &c.

I shall have to leave my notes on "Col. SELLERS" of Memphis, Tenn., and also all notes on the State Fair until to-morrow. I've exceeded both my strength and limits already.

A NEW SHRUB. *Viburnum dilatatum*, the Botanical Magazine says, is a hardy white-flowered Japanese shrub, with large leaves somewhat like those of the common Hazel Nut. There are ten or twelve Japanese species of Viburnum, including the present plant which promises to be a welcome addition to our gardens. Some of the Viburnums owe much of their beauty to the fact that they bear enlarged but abortive flowers in a way analogous to those of the Hydrangea. In the present species, however, the flowers are all normal, forming dense rounded clusters at the apex of the downy stem.

Floricultural.

ANNUALS.

DURING the next two weeks, we may sow Antirrhinum, Petunia, Balsam, Perilla nankinensis, Callirhoe, Pansies, Alonsoa, Jacobæa, Salpiglossis, Nigella, Linum, Brachycome, Clarkia, Collinsia, Cacalia, Abronia, Ageratum, Viscaria, Alyssum, Amaranthus, Argemone, Bartonia, Browallia, Dianthus, Cannas, Celosia, Erysimum, Euphorbia, Entoca, Lobelia, Lupinus, Malope, Marigold, Mignonette, Nemophila, Nolana, Phlox, Ricinus, Salvia, Sanvitalia, Stock, Trapæolum, Whitlavia.

The above are among the most desirable of the Annuals; all either hardy or half-hardy, succeeding with ordinary skill and without bottom heat or any of the florist's "secret" appliances.

Of *Antirrhinum* we recommend the *dwarf* speckled and striped varieties. Though perennials, they will give greater satisfaction if raised from seed every spring. They bloom less freely the second year and are often much injured by the winter, even if protected. Planted at this time, or within two weeks, they will bloom early in July, continuing until after frosts.

Petunias started now will begin to bloom as soon as established in the open ground. We have found that the potato beetle is very partial to this plant, as to every other relative of its first choice, *Solanum tuberosum*.

We prefer the strain of *Balsam* known as Smith's Prize, having used it several years, always with most gratifying results as regards variety of color, size and "doubleness" of bloom. Place the plants two feet apart and never two or more together. Give them well-rotted manure generously and the results will please.

Perilla nankinensis, of plants valuable only for foliage, is one of the best. It is a dark, purplish-brown—almost black, bronzed with dull green. Rapid growth—large, crimped leaf.

Pansy seed can be procured for from five to fifty cents per packet. Get the best. The soil cannot be too rich, and the situation should be shady after early morning. If once they suffer from dryness, the flowers dwindle to little things. Save seeds only from the best marked, largest flowers. A thread or yarn should be tied about them as they bloom.

Alonsoa requires a little care as to watering, on account of a readiness to damp off, when not sown upon hotbeds. The flowers are small but brilliant, and they may be potted in the fall for winter purposes.

Salpiglossis, at least to those who have never cultivated it, is to be highly recommended. The flowers are funnel-shaped, two inches in diameter, purple, light blue, buff, crimson—all prettily veined, rich and velvety. *S. nigra* is a novelty, nearly or quite black. They prefer a sandy soil and shade from the hottest sunshine.

Among *Clarkias*, several novelties are worthy of note. Mr. B. S. WILLIAMS of London offers "Purple King" and "Salmon Queen" as comparable in substance to the finest double Balsam.

Collinsia is a pretty California annual, growing about one foot high; some lilac, some white and purple, and others (*C. multicolor*) crimson, lilac and white.

Of the *Viscarias*,—*Dunnetti, Cardinalis, elegans picta striata* are the best.

Amaranthus salicifolius is beautiful when well grown. Queen Victoria is said to resemble *tricolor* in its tints and *salicifolius* in form. In the sandy soil of the south side of Long Island, we have grown these plants so as to form the most beautiful objects of the garden. The brightly contrasting colors of crimson, yellow and green would early develop, spreading over the whole plant and increasing in brilliancy until frost. But in northern New Jersey, they have never with us been worth ground-room—varieties of *tricolors*, etc., never breaking at all, and *salicifolius* dying unaccountably during midsummer.

Argemone is a fine thistle and goes well with *Chamapeuce* among bedded-out *Cacti* and *Agaves*.

We can speak very highly of the annual Pinks—such as *Chinensis, Heddewiggi, laciniatus, imperialis, albus, astrosanguineus*. These in warmer climates are biennial or perennial. But it is easier and better to raise them from seeds than it is to trouble about protection—growing as they do with the utmost readiness and certainty, and blooming early and continuing until the first of November. Through August the first flowers mature seeds and the plants become ragged. But they recover and give satisfaction while they last.

The *Cannas* from seeds sown now, make strong plants of great leaf-beauty. Soak the seeds in hot water over night.

Among *Celosias*, *C. pyramidalis plumosa* and *Japonica variegata* are mentioned among the newer varieties.

Euphorbia variegata is margined with white and is a very pleasing, easily-grown annual.

For those who like yellow flowers, *Tagetes signata pumila* (new dwarf Marigold) will be sure to please. It is compact and round and one mass of flowers.

The foliage of *Nolana* resembles that of young Petunias, though smoother and more spatulate. The flowers in form are like a morning-glory, though far more enduring. *N. atriplicifolia* is distinctly blue, yellow and white in horizontal bands. It thrives best in sandy soil and warm exposures. We have found but the one objection to this annual that it is generally eaten up by insects unless dusted occasionally with hellebore, sulphur or some other exterminator.

Phlox Drummondi has the only fault of growing too tall for its strength and foliage. The latest variety of Phlox bears a large, enduring flower of a dull Yankeen color.

Ricinus Gibsoni is a very distinct variety of the castor-oil plant, having dark-red foliage and growing about five feet high.

Sanvitalia procumbens fl. pl. grows rapidly, bearing little Dahlia-like flowers one inch diameter, of a greenish-yellow, semi and fully double.

Among *Zinnias, Z. Darwini* is offered, fifty cents for twenty-five seeds. We have read several accounts of this annual and are prepossessed that it would be valued less if it bore a less "taking" specific name.

With trifling modification, all the above may be planted in pots or boxes, well-drained and filled with sod-soil, or old manure, and sand. Do not be afraid of using sand too freely. Press the soil firmly and smoothly—plant in depth according to size of seed and—without ever permitting the surface to "dry out"—endeavor to preserve it barely moist. C.

FLORICULTURAL NOTES.

Camoensia Maxima.—J. J. Monteirs in his work entitled "Angola and the River Congo" describes this plant as a hard, woody bush with long branches, fine large leaves, and bearing bunches of flowers, the lower, and by far the largest petal of which is shaped like a shell of a delicate creamy-white, with its edges exquisitely crimped, bordered with a golden rim, and nearly the size of an open hand. Half-a-dozen of the seeds which he procured, germinated at Kew Gardens, so that we may "hope this lovely flower will be shortly in cultivation—a welcome addition to our hot houses." Our engraving is reprodnced from the London Garden.

Thunbergia Harrisoni.—We hope that some of our readers will try this vine out-of-doors next summer. An English exchange (The Gardener) says:—"Like most other climbers it grows better and makes larger plants when it can be planted out in a prepared border having ample drainage, with a compost of rough, fibry loam, leaf-mold and a little sand and charcoal, all well mixed together." It is easy to mistake these flowers for Gloxinias, which alone will give an idea of their beauty. All accounts agree that the red spider is its greatest enemy—though easily checked if the plants are properly drained, well supplied with water and frequently syringed.

Double Begonias.—The English Journal of Horticulture says:—The double-flowered Pelargoniums and Cinerarias are to be followed by double-flowered Begonias, some varieties of the tuberous-rooted section being announced by M. Lemoine of Nancy. It is only the male flowers of each fascicle that are double, the female flowers retaining their normal form. Of these varieties B. Gloire de Nancy is in color rich vermilion, and B. Lemoinei orange scarlet. They are to be distributed the ensuing season.

The Revue Horticole states that the practice of watering store and greenhouse plants with tepid water is wrong A much better result is obtained by using the coldest water within reach.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near N w York City.

LARGE GRAPE VINES.

March 13.—California is going to show her biggest grape-vine at the Centennial Exhibition this summer, and I think *we* Eastern people ought to look up some of our wonders in this line, for who knows but we might match our neighbors over the other side of the big ridge?

There are some large, wild vines to be found on this side of the mountains, and if the very largest were hunted up and exhibited they would not fall far behind the California Monster. Several years since I procured a section of wild grape-vine, cut from the stem fifty feet from the roots, which measures now, after being thoroughly seasoned, twenty-four inches in circumference. The vine from which this piece was taken grew wild in the woods of Tennessee, and as the lower part of the stem had commenced to decay, I was obliged to take a section at some distance from the ground in order to secure a good, sound specimen. Now, I want some one to find a larger wild vine than mine, and the one who does shall have my specimen to go along with it to the Centennial. Of course I should be allowed a little lee way for shrinkage of my specimen, still I will not be particular on that score, and if anybody can find a larger this side of the Rocky Mountains I will take off my hat to the finder and own up beaten. Come now, boys, "trot out" your big grape-vines and don't let the Californians have it all their own way with their Santa Barbara wonder.

THE KIRTLAND RASPBERRY.

I am pleased to see that this old and excellent hardy native raspberry is again being recommended as worthy of a place among the best of the newer sorts. I have had occasion to discard many a variety for which I paid a fancy price, but the *Kirtland* has never met such a fate at my hands, because of its many valuable properties. It is one of the earliest of all our native varieties, and although the berries are only of a medium size, they are excellent in quality and of a firm texture, consequently carry well to market. There is, however, one difficulty in the way of reviving old sorts like the *Kirtland*, and that is in procuring genuine plants unmixed with others, for those who make it a point to try all the new varieties are very likely to neglect the old, consequently there is quite frequently a good deal of mixing of plants, which are not easily separated again except by those who make raspberry culture a specialty.

Raspberries and strawberries are probably the most difficult of all our small fruits to procure pure and genuine, because the plants spread rapidly, and it is not uncommon to find suckers of the red raspberries coming up six to ten feet from the parent stool, and perhaps directly among those of another variety cultivated in adjoining rows. The runners of strawberries will spread over walks and into adjoining rows, taking root in a few days, thereby becoming fixed in a position to stay and go on propagating its kind; therefore, constant attention is required to keep varieties pure and unmixed when two or more are cultivated in the same field or garden. Much of the diversity of opinion so frequently expressed in regard to the value, habits and merits of varieties originate in this way, one cultivator having the genuine sort and another something else, but both suppose they are talking about one and the same.

I have so frequently purchased mixed varieties that I am inclined to think a good many other persons have shared no better, consequently one cannot be too sure of the identity of a variety of raspberry or strawberry before expressing an opinion in regard to its merits. If somebody would only bring out the old *Kirtland* raspberry under a new name and sell the plants for $10 a dozen, it could scarcely fail to be pronounced a "big thing," until some other body discovered and let the world know that it was not new.

THOSE SEEDLING POTATOES.

March 14.—My colored gardener, JOHN, as I stated a few weeks since, has become quite interested in the potato seedling question, and the way he is going on the bedding plants will be crowded out of the greenhouse in order to make room for his pets. JOHN cannot read or write, which is lucky for me, because, did he once see the advertisement of "Pringle's *Hybridized* Potato Seed," I fear he would go stark mad, as I have almost, in reading it and trying to find out how he gets *hybridized* potato seed by *crossing* two or any number of varieties of the same species.

In my (perhaps) ignorance I had always supposed that a hybrid was a mixture of two species of plants or animals, and not a cross between two individuals or varieties of one, and consequently I am puzzled to know what other species of potato besides the *Solanum tuberosum* Mr. PRINGLE is employing to obtain his *hybridized* seed. May be it's all right, but my old brain is too dull to understand why the word "hybrid" should be incorrectly used, as it evidently is in this case.

But to return to the seedling potatoes, which are thriving as well as could be expected while cramped in small thumb-pots and boxes. It is quite an interesting study to note the variations in these seedlings, although raised from seed-balls as gathered in the field, without any regard to variety or cross-fertilization. The leaves vary in size, form and color, while the precociousness of an occasional plant in producing tubers is somewhat remarkable. Quite a number of these little seedlings, which are not over three inches high, have already produced from one to half a dozen tubers as large as good-sized peas, which shows there is likely to be a great difference in the earliness and productiveness of the varieties.

Then, again, one can see at a glance by these precocious seedlings how the tubers are formed, or upon what part of the plant they are produced, which is not upon the true roots, as many persons suppose, but upon subterranean stems. After the first upright or main stem has reached a certain degree of development, lateral branches spring from buds near the base, but above the primary roots. These laterals push into the soil a short distance only, then rest, as it were, and become the depositories of nourishment, which is formed from the fertilizing elements in the soil and air, assimilitated by the leaves, then sent down to these subterranean stems, which are developed into what we term potatoes.

Now, I have referred to JOHN'S seedling potatoes, not because there is anything new or novel about his experiments, or that there is the slightest probability of a superior variety being found among them, but merely for the purpose of showing farmers' sons who may read this that producing new sorts is not a mysterious or difficult operation. It is not necessary to start the plants in a greenhouse, or even in a hotbed, although they may be advanced more rapidly in these structures than in the open ground; still, whatever treatment is required for hastening the growth and maturity of tomatoes will answer for seedling potatoes. If our farmers' sons were encouraged to make experiments in this direction and shown what there was to be learned in regard to habits of plants under domestication, there would be less complaint of farming being a dull business.

Every boy residing in the country should be taught how to bud, graft and propagate plants from seeds and cuttings, as well as receive a few lessons in vegetable physiology, at least enough to enable him to determine the principal organs of reproduction, in order that he may know how the different varieties of corn become mixed when planted near together, as well as many other kinds of cultivated plants. Five dollars' worth of books and a course of six lectures given in the country school-house, or elsewhere, by some one who knows how to explain such things in simple, easily-understood language, would, in nine cases out of ten, make a boy believe that the farm was, as it is, the best place in the world for amusing and instructive study.

The girls may be admitted to the same course of study and lectures without the least fear of making them any the less better fitted to become wives and companions for farmers or those who belong to what are termed the learned professions. There is not a school district in any of the more thickly-settled of the old or new States which cannot afford to pay for instruction of this kind, and I am quite certain that when our young folks have once been shown the way, there will be less discontent and inclination to leave the country and huddle into over-crowded cities and villages.

Entomological.

CONGRESS AND THE ENTOMOLOGICAL COMMISSION.

A FEW weeks since Senator INGALLS of Kansas, introduced a bill providing for the appointment of a commission composed of scientific entomologists, to investigate the habits of insects most destructive to crops, and especially the Rocky Mountain Locust. We had at the time little faith in the passage of the bill, or any other likely to lead to practical results, knowing the general indifference of politicians to anything which would aid in the advancement of the interests of agriculture. Had our Senator from Kansas introduced a bill appropriating a-half a million dollars to ascertain the cause of the Aurora Borealis, or whether the earth was hollow or stuffed with sawdust, there would have been a much better chance of success, than to ask for a mere pittance to aid in discovering some method of saving the farmers of this country two or three hundreds of millions of dollars annually, which they now lose through the depredations of noxious insects.

Another mistake of our worthy Senator from Kansas, was his estimating the cost of the proposed commission at from $15,000 to $25,000 per annum, which should have been placed at $100,000 at least. This sum would have impressed our National Legislature with an idea of its importance, and then after whittling the sum down in the usual manner, one-fourth of that amount might have been obtained. But by starting out in such a modest manner, asking that only three entomologists be employed and at a salary of $5,000 a year, it left no margin for a lobby or whittling as the result has shown, for we learn that a bill has actually passed the Senate, providing for a commission of "one" entomologist at a salary of $4,000, to make investigations of various kinds of insects, the locust, chinch bugs, cotton and army worm to receive particular attention. Now this bill as passed by the Senate, is only making a farce of what is a very serious and important matter of national interest. To ask or expect one man to spread himself all over the United States and Territories, and investigate a dozen different kinds of noxious insects at the same time, is absurd, and we only hope no entomologist will be found willing to place himself in such a ridiculous position as to attempt it.

If Congress will not appropriate a sum sufficient to make proper investigations, it had better do nothing, for we have had a surfeit of the "cheap John," kind of entomological reports in volumes issued from the Department of Agriculture, and we do not believe the people wish to pay for any more of the same sort. If the annual losses to our agriculture through insect agency are not already sufficient to command the respectful consideration of our law-makers, then we beg of them not to add insult to injury by proposing a "one horse" commission, and offering it a sum for compensation which would scarcely pay its expenses.

When the cotton worm appears in the Southern cotton fields again we hope the planters will remember that Congress refused to appoint, or pay a commission to investigate the habits of this insect and discover some method of destroying. Western farmers may also bear this in mind as the locusts sweep down from the mountains, devouring the last stalk of corn, wheat or other plant which has been reared by the sweat of their brows. It has been well said that the farmer "pays for all," but when in return for it he asks moderate rates of postage on the seeds, plants, and cuttings, which in thousands of instances he cannot obtain through any other medium except the mails he is informed that the Government cannot afford to accommodate him in this matter, although as everybody knows millions of dollars are annually squandered by the department to enrich certain political favorites. No matter what party is in power the same lavish expenditure of funds goes on.

It is seldom that the agricultural community ask for any direct aid as in this case of a commission to make investigations in regard to noxious insects, but the refusal of Congress to comply with their wishes, shows how much our Legislators know or care about the losses which occur through the ravages of these pests of the farm.

Pomological.

ABOUT QUINCES.

THE common quince (*Cydonia vulgaris*) is supposed to have been cultivated by the ancient Romans, and from that time to the present, hence it is not strange that we have quite a number of distinct varieties. The most popular sort is what is generally termed the orange or apple quince; but even of this there are a great number of varieties, some much larger, earlier, and better flavored than others. In some few instances distinct names have been given to what are supposed to be distinct varieties, such as Rae's Seedling, the Douglass and other sorts known in particular localities, but not generally mentioned in our pomological works.

Among the larger varieties of the apple-shaped quinces there is not sufficient difference to enable one to separate them by the aid of the most minute description, as can usually be done with pears and apples, hence our pomological authorities generally speak of all of any particular form as one variety, as, for instance, those of a globular form as the apple quince, and the pyriform as the

PEAR QUINCE.

These pear-shaped quinces are of the same species, and only varieties of the apple quince, and some of them very large, handsome and valuable. A few years since we procured one under the name of the Day quince, which is a very superior variety, quite long, bell or pear-shaped.

The pear-shaped varieties are sometimes sold under the name of the Portugal Quince, which is certainly incorrect. The genuine

PORTUGAL QUINCE

is quite distinct from the ordinary orauge or pear-shaped sorts, and, by some authors, supposed to be a distinct species. Its leaves are large, broad, nearly heart-shaped, very thick, and darker green than the above sorts. The growth of the tree is also more sturdy and coarse, the young twigs coarse, covered with very dark, almost ebony-colored, bark in autumn. The fruit is neither round nor pear-shaped, but oval, tapering to both ends, but the upper much the smaller. The fruit ripens late, and seldom assumes the bright, clear yellow color seen in the other sorts. It is said to be highly esteemed in England, but is seldom cultivated in this country, although we have frequently seen it in the old gardens and nurseries in the suburbs of this city.

ANGERS AND FONTENAY.

It has been claimed that these are varieties of the Portugal, but, after seeing hundreds of them bearing fruit, we feel inclined to doubt this, for they appear to be nothing more than varieties of the orange, or common pear-shaped sorts, producing a smaller fruit as a kind of offset to a more rapid growth of wood. But it will hardly do to be very positive in regard to the identity of either the Angers or Fontenay, as the French nurserymen have not heretofore been very particular in regard to the genuineness of quince stocks sent over to the Yankees, and it is not an uncommon occurence to find good apple and pear-shaped quinces among what were sent us as Angers and Fontenay. The quince which we have known as the Angers for the past twenty years is a small fruit, about two inches or a little more in diameter, and of the ordinary apple-shape, of excellent quality, but of too small a size to become popular for market.

CHINESE QUINCE.

(*Cydonia sinensis.*) This is a distinct species, cultivated mainly for ornamental purposes. The leaves are very thick, oval, oblong, the edges finely and sharply serrate. They frequently assume a bright crimson color in autumn. The flowers are large, white, or faintly tinged with rose, and slightly fragrant. The fruit is large, regular, oval, bright yellow when ripe, but the flesh is coarse and gritty, and, although it may be kept for six months, it can scarcely be considered as edible. This species is generally propagated by budding upon the common quince, it then grows rapidly, forming a handsome, large, erect-growing shrub ten to fifteen feet high. A few years since there were some quite old plants of this species in the gardens about this city, and presume there are an occasional one remaining, although we lost ours in the winter of 1873-4.

JAPAN QUINCES.

(*Cydonia Japonica.*) These are well known showy ornamental plants, producing very tough, hard, fragrant fruit, not generally considered edible. There are several varieties, mainly differing in the color of their flowers, which vary from a pure white to a deep, brilliant scarlet. Of late years the Japan quince has been recommended as a hedge plant, and it answers the purpose admirably, except that cattle will browse off the leaves if afforded an opportunity, therefore it should not be used except for ornamental hedges and screens. It is readily propagated by cuttings of the roots made in the fall, and kept where they will not freeze during the winter, but not warm enough to induce them to sprout and grow.

FRUIT IN WISCONSIN.

IN my article some weeks ago on fruits I made some errors, as I wrote it in a hurry, in the place of Tetofski read Red Astrachan and instead of Haas read St. Lawrence apples. We lost many varieties last winter but the Red Astrachan, St. Lawrence and Famouse were uninjured and the last two bore; next best were Northern Spy, and American Golden Russet, these five are about all we had that did any thing. There is a pear orchard 5 miles from here set in 1862 and but few trees have died and they bear well and annually. Among the best are Flemish Beauty, White Doyenne, Winter Nelis, Buffum and Beurre Clairgeu.

This is a country little thought of for farming, yet one man on 9 acres last year raised 716 bushels of oats, another on 7 acres raised 183 bushels of barley and on 12 acres 507 bushels of wheat, etc. A. M. VAN AUKEN.

Fort Howard, Wis.

SMITH'S CIDER APPLE.

I DON'T wonder at the great popularity of this apple when I see the profits arising from its culture in certain portions of the State of Pennsylvania. An instance of "money in the orchard" has lately been brought to my knowledge, where a farmer in Bucks County, Penn., concluded to plant a large portion, if not all, his acres in Smith's Cider Apple, and the result is he has accumulated riches from this source alone. Of course it was not by quietly sitting down and watching his trees grow and waiting for customers to come along and purchase his fruit, but he tended his trees carefully and made a market for his crop. He found the variety that was specially suited to his locality, that would always fruit, that sold freely, that carried well, and the result has been entire success. It did not matter to him that wise savants turned up their nose at his want of taste in not selecting a rich, highly flavored variety; sufficient that it would pay, and pay it has.—*Cor. Tribune.*

Domestic Economy.

MENDING TINWARE.

HAVING read a communication in the RURAL upon this subject, and, having had some experience in the art, I give your readers the benefit thereof.

One can very easily learn to mend their own tin, and a soldering iron is much better than a candle to do it with, as the solder will adhere to the tinned face of the iron, and may be drawn along a crack, or seam, and spread or rubbed over a hole. If the solder is not inclined to stick, a little rubbing the place with the hot iron will assist it to do so.

In order to brighten tin for soldering, it should only be scraped very lightly, that the iron plate beneath may be exposed as little as possible; for the reason that solder does not readily adhere to an iron or untinned surface, and if there are any spots uncovered by the solder, the iron will soon corrode and make a new hole—and this is the reason why I have learned better than to use acids, or soldering fluid. They are so powerfully corrosive—as your correspondent says—that they set up an action on the tin, especially if the iron is exposed, and in a little while the whole spot will be rusted out. *Acids are wholly unnecessary in soldering tinned surfaces.* Tinners do not use them in ordinary tin work; but they are useful for brass, copper, zinc, etc. A little rosin, put upon the place with your solder is all that is necessary, and is not corrosive. If the iron is heated *too* hot, so that it is red, the tinning upon it will be destroyed and at the same time will eat cavities in it, making a rough face, in which case it may be hammered down some, then filed bright, and tinned again, by heating it so that it will melt solder, and then rubbing its bright face in the melted soldier, with rosin, on a brick. The brick serves to keep it bright, until the solder adheres. REUBEN ANDREWS.

TO GET RID OF HOUSEHOLD PESTS.

CHAS. THOMPSON writes to the Scientific American that he has not seen a bedbug or flea in his house for many years, and adds:—If an army of them were to be brought in, mercury would speedily exterminate them; but I think cleanliness the best and perhaps the only preventive. The common house fly I do not molest, believing it more than compensates for its trouble by clearing the atmosphere of effluvia and the animalcules which always arise from the putrefaction of decaying substances during the warm weather. So also with the birds, which are quite numerous here, during the summer. Instead of shooting them or setting up scarecrows to frighten them away, I throw out every possible inducement for them to build their nests in my fruit trees. The birds capture a large share of the insects in the larval state, and thus the millers are prevented from depositing eggs for a future crop of worms. As to the loss of fruit by the birds, the latter are always sure to be on hand in force in the season of ripe fruit, whether they come early enough to take the worms or not. For the residue of insects which infest my vegetable garden I find that the laboratory of the chemist furnishes materials fatal to them all, among which white hellebore and cayenne pepper are of the most utility.

The bug or worm which cannot find vegetation unflavored with these articles will seek its breakfast elsewhere, and leave my garden unmolested. A few drops of carbolic acid in a pint of water will clean house plants from lice in a very short time. If mosquitoes or other blood-suckers infest our sleeping rooms at night, we uncork a bottle of oil of penny-royal, and these insects leave in great haste, nor will they return so long as the air in the room is loaded with the fumes of that aromatic herb. If rats enter the cellar, a little powdered potash thrown into their holes, or mixed with meal and scattered in their runways, never fails to drive them away. Cayenne pepper will keep the buttery and storeroom free from ants and cockroaches. If a mouse makes an entrance into any part of your dwellings, saturate a rag with cayenne in solution and stuff it into a hole, which cannot be repaired with either wood or mortar. No rat or mouse will eat that rag for the purpose of opening communication with a depot of supplies.

SELECTED RECIPES.

Rice Batter Cakes.—Mix one-fourth wheat flour to three-fourths of rice flour; add a little salt; raise and bake as buckwheat cakes.

Infants' Food.—Mix the rice flour with cold milk and stir it into boiling milk until of the proper thickness; sweeten with loaf sugar.

Rice Muffins.—To one quart of sour milk three well beaten eggs, a little salt, teaspoonful of soda and enough of rice flour to thicken to a stiff batter. Bake in rings.

Rice Custard.—Into a quart of boiling water stir two tablespoonfuls of rice flour, dissolved in a little cold milk; add two well beaten eggs to boiling mixture: sweeten and flavor to taste.

Rolled Jelly Cake.—One cup sugar, one cup flour, three eggs, one tablespoonful sweet milk, half teaspoonful soda, essence, etc. Beat sugar and eggs slightly, then put all altogether and beat thoroughly.

Rice Sponge Cake.—Three-quarters of a pound of rice flour; one pound of white sugar, ten eggs; beat the yelks with the sugar; the whites alone; add the yelks, sugar and flour together a little at a time; flavor and bake in shallow pans.

Batter Pudding.—One quart sweet rich milk, twelve tablespoonfuls flour, a little salt, eight eggs. Beat the eggs separately, very light, and have the batter perfectly smooth. Bake quickly, and send to table immediately. Serve with butter sauce.

To Clean the Inside of any Tea Pot.—If the inside of your tea-pot or coffee-pot is black from long use, fill it with water, throw in a small piece of lard soap, set on the stove and let it boil from half an hour to an hour. It will clean as bright as a new dollar, and costs no work.

Scolloped Veal.—Chop cold cooked veal fine, put a layer in a baking dish, alternating with a layer of powdered crackers, salt, pepper and butter, until you fill the dish. Beat up two eggs, add a pint of milk, pour it over the veal and crackers. Cover with a plate and let the top brown.

Cleaning Knives.—A small, clean potato, with the end cut off, is a very convenient medium of applying brick dust to knives, keeping it about the right moisture, while the juice of the potato assists in removing stains from the surface. We can get a better polish by this method than by any other we have tried, and with less labor.

Indian Cake, or pone, as it is sometimes called, makes a delightful breakfast dish. Our method is as follows:—1 quart of buttermilk, 4 teacupfuls of Indian meal, 2 of wheat flour, 4 tablespoonfuls of molasses or brown sugar, 1 even tablespoonful each of soda and salt. Bake in a quick oven. This rule makes two handsome cakes.

Hot Slaw.—Butter the size of an egg, half a cup of milk, yellow of two eggs, teaspoonful of salt, one-fourth of a teaspoonful of pepper, small level teaspoonful of dry mustard and three tablespoonfuls of vinegar. Put the butter into the skillet with the fine cut cabbage and the other ingredients, and stir all the time until the cabbage heats well through.

To Mend Chinaware.—Take a very thick solution of gum arabic and stir into it plaster of Paris until the mixture is of proper consistency. Apply it with a brush to the fractured edges of the chinaware and stick them together. In a few days it will be impossible to break the article in the same place. The whiteness of the cement renders it doubly valuable.

Hygienic Information.

WHEATEN MEAL BREAD.

IN the "Philosophy of Eating," Dr. BELLOWS gives the following classification of food:—"First, Carbonates; that class which supplies the lungs with fuel, and thus furnishes heat to the system and supplies fat, or adipose matter. Second—Nitrates; that class which supplies the waste of muscle. Third—Phosphates; the class which supplies the bones, the brain, and the nerves, and gives vital power, both muscular and mental." The Nitrates and Phosphates in wheat are all contained in the *gluten*, which adheres to the bran and middlings, and is rejected with it in the bolting process. Dr. BELLOWS states that "animals and persons have been fed on pure starch, sugar, or fat alone, and they gradually pined away and died." He adds:—"The Nitrates in all the fine starch flour bread a person can eat is not sufficient to sustain life beyond 50 days!"

The superiority of wheaten meal bread was recently confirmed in Paris by a French chemist thus:—Two dogs of the same age and apparent strength and vitality, were fed—the one on starch bread and water alone. He pined away and died at the end of 40 days. The other was fed on wheaten meal bread and water alone, and at the end of 40 days he exhibited increased strength and vitality.

Dr. HAMLIN says:—"Superfine (starch) flour bread ranks among the predominant causes which shorten life." Bolted flour is only a carbonate—a heater; hence, it not only fails to build up the system and impart vitality and muscular strength, but by its heating and inflammatory nature enkindles disease, and is the prolific source of fevers and premature death. GOD made wheat in the right proportions to build up the entire system. The bolting process is a sin—a deadly curse.

O. S. HUBBELL, M. D., a distinguished Pharmaceutist of Philadelphia, says:—"The whole grain of wheat contains of tissue-making elements—gluten, albumen, &c.,—double the amount of that portion called fine flour. He adds:—"As the 'bolted part' is only one-fourth of the whole, it follows that each pound of it is equal to three pounds of fine flour in nutritive elements."

Dr. SAMUEL JACKSON, Professor of the Institutes of Medicine in Pennsylvania, whose opinions as a physician and physiologist, in this and other countries, are held in such high estimation, says:—"The phosphate of lime is a necessary constituent of all grain. Furthermore, it is an important nutritive principle, and recent experiments have proved it to be an indispensable element in the construction—not of bones only, but of all the animal tissues. A deficiency of the phosphate of lime in food is a common cause of ill health, of defective development and retarded growth in children, one-fourth of whom die ere they pass the age of seven! By the mistaken bolting process, the phosphate of lime is rejected with the bran, and in consequence this necessary and highly important element of nutrition, contrary to the arrangements by nature, is lost, and not obtained from bolted fine flour bread."

No such bread, in ancient times down to the period of the emperors, was known. It is the invention of modern folly. Mark, and observe the following statement. Dr. BELLOWS says that it is found by analysis that the human body is composed of 14 elements—the basis of every part of the system. He gives the 14 names, then adds:—"Wheat contains the same 14 elements found in the human body, and in the nearest average proportion of any other cereal or single article of food required to supply the system with muscle-making, heat producing and brain and nerve-feeding elements. Unbolted flour, containing 14 essential ingredients needed to build and nourish the 14 elements in the human body, is the true natural aliment of the race."

Wheat is scientifically termed the "staff of life." It contains everything necessary to the growth and support of the human system. The Eastern Christians, who retired from persecution to the deserts of Egypt and Arabia, lived on bread, crushed wheat and water alone, yet lived long and happy; their ages ranged from 101 to 120 years each! Let every person desirous of good health and long life make a speedy return to this *natural* and nutritive article of bread. Let them reject modern fashionable cookery, which Lord KAMES says, "Depopulates like a pestilence."

Middlebury, Vt., Feb., 1876.

EATING—DYSPEPSIA.

IT is an old German adage that "more people dig their own graves with their teeth than with spades," and verily it with seem so if we would look at the immense number of dyspeptics, rheumatics and gouty individuals, creeping through life in pain and wretchedness. Yet it is next to impossible to induce even thinking people to control their appetites, and to eat such things and at such times as nature shows them is necessary and right. Dr. Hall declares, unhesitatingly, that it is wrong to eat without an appetite, for it shows there is no gastric juice in the stomach, and that nature does not need food, and not needing it, there being no fluid to receive and act upon it, it remains there only to putrify, the very thought of which should be sufficient to deter any man from eating without an appetite the remainder of his life. If a tonic is taken to whet the appetite, it is a mistaken course, for its only result is to cause one to eat more when already an amount has been eaten beyond what the gastric juice is able to prepare. The object to be obtained is a large supply of food; and whatever fails to accomplish that essential object, fails to have any efficacy towards the cure of dyspeptic diseases. The formation of gastric juice is directly proportioned to the wear and tear of the system, which it is to be the means of supplying, and this wear and tear can only take place as the result of exercise. The efficient remedy for dyspeptics is work—out-door work—beneficial and successful in direct proportion as it is agreeable, interesting and profitable.

BABIES' LEGS.

BOW-LEGS and knock-knees are among the common deformities of humanity; and wise mothers assert that the crookedness in either case arises from the afflicted one having been put upon his or her feet too early in babyhood. But a Massachusetts physician who has watched for the true cause, thinks differently. He attributes the first-mentioned distortion to a habit some youngsters delight in of rubbing the sole of one foot against that of the other; some will go to sleep with their soles pressed together. They appear to enjoy the contact only when the feet are naked; they do not attempt to make it when they are socked or slippered. So the remedy is obvious; keep the baby's soles covered. Knock-knees the doctor ascribes to a different childish habit, that of sleeping on the side, with one knee tucked into the hollow behind the other. He has found that where one leg has been bowed inward more than another, the patient has always slept on one side, and the uppermost member has been that has been most deformed. Here the preventive is to pad the insides of the knees so as to keep them apart, and let the limbs grow freely their own way. All of which is commended to mothers who desire the physical uprightness of their progeny.

HYGIENIC NOTES.

Two teaspoonfuls of finely powdered charcoal, drank in half a tumbler of water, will often give relief to the sick headache when caused, as in most cases it is, by a superabundance of acid in the stomach.

Parents should be very careful and not let the rays of the sun shine directly upon the faces of sleeping children. Strong light is very injurious to the eyes, especially if they are inclined to weakness.

A small piece of paper or linen, moistened with spirits of turpentine and put into a bureau or wardrobe for a single day, two or three times, is said to be a sufficient preservative against moths.

Scientific and Useful.

LIME AS A CONSTITUENT OF PLANTS.

THE Scientific Farmer for February contains an article devoted to lime, which comprises a positive scientific statement of facts. The following extract will be especially interesting and useful:

Among the most prominent constituents of plants is lime. It is one of the items indispensable to plant growth. The importance therefore, of its being at the disposal of crops as plant food is at once recognized. A few figures will indicate this more clearly. The table shows the percentage of lime in the ash of the plants named.

Grasses, average of sixteen kinds	7.9
Red clover	34.0
Potato tubers	2.3
Potato tops, August	39.0
Potato tops, October	46.2
Turnip roots	10.4
Turnip tops	32.4
Indian corn grain	2.7
Indian corn stalks	10.5
Wheat grain	3.1
Wheat straw	6.2
Tobacco	37.0

The table gives prominence to two facts, namely—that lime is an abundant ingredient in the ash of plants, and that the variation on account of this item in different plants and between the stalk and seed, or roots and stems of the same plant is very great. The latter fact has given rise to the name "lime plants" being applied to tobacco, clover, beans, peas, and other leguminous plants on account of the preponderance of that substance in their mineral composition. For a similar reason potatoes, beets, and root crops generally have received the appellation of "potash plants." Perhaps the fruits might be added to the list. It is also noteworthy in this connection that grains are remarkable for the large amount of phosphoric acid present in their ash, in comparison with the other ash constituents.

AMMONIA.

No housekeeper should be without a bottle of spirits of ammonia; for besides its medical properties, it is invaluable for household purposes. It is nearly as useful as soap, and its cheapness brings it within the reach of all. Put a teaspoonful of ammonia in a quart of warm soapsuds, dip a cloth in it and go over your soiled paint and see how rapidly the dirt will disappear; no scrubbing will be necessary. It will cleanse and brighten wonderfully. To a pint of hot suds add a teaspoonful of the spirits, dip in your forks and spoons, (or whatever you have to clean,) rub with a soft brush and then finish with a chamois skin. For washing windows and mirrors it has no equal. It will remove grease spots from every fabric without injuring the garment. Put on the ammonia nearly clear; lay blotting paper over, and set a hot iron on it for a moment. Also a few drops in water will cleanse and whiten laces and muslins beautifully. A few drops in a bowl of water, if the skin be oily, will remove all greasiness and disagreeable odors. Added to a foot-bath, it entirely absorbs all noxious smells, and nothing is better to remove dandruff from the hair. For cleaning hair and nail brushes it is equally good.

For heartburn and dyspepsia, the aromatic spirits of ammonia is especially prepared; ten drops of which, taken in a wine-glass of water, will give relief.

For house plants, five or six drops to every pint of water, once a week, will make them flourish. It is also good to cleanse plant jars. So be sure and keep a bottle of it in the house, and have a glass stopper, as it eats away corks.

"PROGRESS AND IMPROVEMENT."

SATURDAY, MARCH 25, 1876.

A NEW HALF VOLUME.

JUST THE TIME TO RENEW OR SUBSCRIBE.

As this number closes the first half of our present volume, the present is a good time to renew or subscribe for the RURAL. All whose subscriptions expire this week will find the No. of the paper—**1365**—printed after their names on address label. We trust all such will renew at once, thus securing the uninterrupted visits of the paper to their homes—and all the neighbors and acquaintances they may induce to join them will be heartily welcomed into the ranks of the RURAL Brigade, receiving the full benefits of membership. Now that the busy season approaches every one who has a farm, orchard or garden—even a small plot of ground for cultivation—will find the RURAL a profitable investment, while the wife, sons and daughters cannot fail of being interested and instructed by a perusal of its pages. Will not our readers who concur in this, kindly tell their friends about the paper and invite them to give it a trial?

New clubs may be formed to commence with April, and additions to present ones are always in order. Our liberal Premiums are continued, so that Agents and all persons making additions to our list will be rewarded for their efforts.

ANALYSES OF FERTILIZERS.

THE Experimental Station of Middletown, Conn., of which Prof. ATWATER is Director, has been analyzing various brands of fertilizers and has issued a formidable report which, we presume, will figure largely in advertisements and circulars of fertilizer manufacturers the coming season. No names are given; but the value of the manures as per analysis is shown to vary widely—one fertilizer being branded as composed of 63 per cent. of sand. It is said that some of the leading manufacturers readily fall in with the idea of selling according to the value as certified by analysis. The idea is a good one, but is it practicable? Is each consignment of fertilizer to be analyzed? Is one analysis to suffice for a season? or how often will manufacturers submit specimens to the chemists? What is to prevent the manufacturer from submitting samples of much greater value than their general average? On the other hand, and quite as probable, an enemy, possibly a rival, may mix some such worthless substance as sand in a favorite brand of fertilizer and get the chemist's analysis for the purpose of breaking down a rival. We believe in chemical analyses, but not as absolute and unquestionable certificates to the unvarying value of one fertilizer or the demerit of another.

A great deal has been said, and some of it both unjustly and unwisely, about great frauds in commercial fertilizers. Possibly such frauds may exist, but they are neither common nor extensive. With considerable experience in buying fertilizers, the writer has rarely, if ever, failed to find them return more than their cost in the increased value of the crop. The only exceptions have been in seasons too dry to dissolve the fertilizer in time for the crop to use it, and even then it was available for the second year. More often, we have found fertilizers yielding a profit of 200, 300 and 400 per cent. This being so, we have earnestly urged farmers to use fertilizers, cautiously and in small quantities at first, to be increased as warranted by experience. With the very highest recommendations of the chemist, it is not safe for farmers to buy fertilizers by wholesale and use them indiscriminately without experiment. We do not see that it is not safe, despite the anathemas against brands, for every farmer to buy a small quantity for experiment, and if the result is profitable, increase the amount used.

What security has the farmer against a change in the quality of the fertilizer? Exactly the same that he has in any other business transaction. If a farmer becomes accustomed to one brand of fertilizer, he can easily tell it by the appearance, and when he believes there is fraud, he should insist on an analysis. Here the chemist's skill will come in good play, though it will not need a chemist to detect 63 per cent. of sand in a sample. We believe, however, that adulterations are much more rare than are usually supposed. The leading and reputable manufacturers of fertilizers have too much at stake to perpetrate such petty frauds. If men want to cheat, there are a thousand safer and pleasanter ways of doing it than this, and, as a rule, this business has, we believe, as small a proportion of rascals as any.

There is, of course, a difference in the quality of fertilizers—often a difference, and not a dishonest one either—in different lots of the same brand. The manufacturer cannot possibly turn out exactly the same chemical compound each time. What he can and should do is to guarantee a certain per cent. of soluble phosphoric acid, of nitrogen and of potash, if his preparation claims that as a constituent. With such a guarant, and having the farmer keep his eyes well open to the effect on his crops, there will be but little danger of any very serious cheating. There are thousands of farmers who might use commercial fertilizers with profit, but who have never done so through fear of being cheated. There will be no danger in making an experiment the coming season, despite all cries of fraud.

RURAL NOTES AND QUERIES.

New York State Wool Growers' Meeting.—The annual meeting of the N. Y. State Sheep Breeders' and Wool Growers' Association was held in Canandaigua, March 8th. From a report in the Country Gentleman, by the Secretary, we learn that in the absence of the President, Hon. HENRY S. RANDALL, the First Vice-President, E. BRONSON of Bloomfield, occupied the Chair. The spring sheep shearing will be held April 25th and 26th at Batavia. The following committee was appointed to confer with committees of the Ohio and Vermont Societies with reference to a Sheep Register, said committee to report at the April meeting of the Society: E. Townsend, D. Cossitt, S. B. Lusk, John P. Ray, W. G. Markham. The following officers were elected for the ensuing year: President—HENRY S. RANDALL, Cortland; Rec. Sec.—W. G. Markham, Monroe; Cor. Sec.—W. T. Reamer, Yates; Treas.—A. F. Wilcox, Onondaga; Vice-Pres'ts.—Davis Cossitt, Onondaga; Edward Bronson, Ontario; Elbert Townsend, Genesee; Cooper Sayre, Ontario; Peter Martin, Monroe; Lionel Sherwood, Wayne; Joseph Harris, Monroe; Daniel Jamison, Wayne; E. E. Brown, Cayuga; R. J. Gardener, Yates; Henry Morgan, Cayuga; W. N. Perry, Yates; R. A. Avery, Fulton; W. Roble, Steuben; W. M. Holmes, Washington; C. D. Champlin, Steuben; Silas Hillman, Livingston; G. L. Mills, Montgomery; Richard Peck, Livingston; Carl Heyne, Duchess; Ira D. Crandall, Allegany; Isaac N. Johnston, Seneca; J. E. Gilmore, Genessee; I. W. Harvey, Seneca. Ex. Com.—James Geddes, Onondaga; Peter McMillan, Ontario; H. H. L. Sweet, Onondaga; J. C. Short, Livingston; C. Crossman, Genessee; J. J. Brainard, Wyoming; S. B. Lush, Genessee; Stephen Briggs, Yates; E. L. Gage, Madison; G. F. Martin, Monroe; C. F. Hardick, Orleans.

Vermont Sheep Breeders in Council.—The breeders of Spanish Merino sheep in Vermont, at a recent adjourned meeting held in Middlebury—with Col. E. S. STOWELL in the chair, and G. S. CUTTING as Secretary—adopted a course designed for the mutual protection and promotion of their interests. The question was as to the desirability of entering their flocks in the Register in process of formation by the Ohio Wool Growers' Association. An elaborate report from Hon. R. J. JONES, chairman of a committee previously appointed, approved of the efforts of the Ohio breeders to preserve the purity of their flocks, but made no recommendation as to the desirability of entering in the Ohio Register. The report concludes—"In Vermont, where the prestige is not increasing, we need all the facilities at our command to preserve the purity of our flocks, and to preserve the quality as well. If co-operation, if a sheep register will aid us, give us a sheep register." It was finally resolved to organize a Spanish Merino Sheep Breeders' Association of Vermont, and a committee of three (consisting of S. S. ROCKWELL, ALBERT CHAPMAN and E. E. STICKNEY) was appointed to draft a constitution and by-laws to be presented for consideration and adoption at an adjourned meeting. After thanking the Ohio Association for its efforts in behalf of a Merino Sheep Register, and declining to join with it in a competitive one, the meeting offered to unite with Ohio or any other State in the establishment of a National Register for the preservation of the pedigrees pure of the Spanish Merino Sheep of America.

Legislating for Pure Fertilizers.—Senator SEGKREG has introduced into the N. Y. Legislature a bill to prevent frauds in the manufacture and sale of commercial fertilizers. It provides that commercial manure sold or kept for sale in the State shall have affixed to every bag, barrel or parcel thereof containing fifty pounds or upward, a printed special name or trade mark by which the same may be known, with the name and place of the manufacturer or importer, together with a true specification of the guaranteed per cent. of the phosphoric acid soluble in water, phosphoric acid insoluble in water, nitrogen and potash contained therein, and also the quantity of fertilizer contained in the package, and the date of the manufacture or importation. A penalty of $10 is fixed for the violation of the above provisions. The provisions of the act are not applied to any other commercial manure which is sold at a price not exceeding one cent per pound. The bill creates the office of State Assayer of Commercial Fertilizers, of which the Professor of Agricultural Chemistry of Cornell University shall be *ex-officio* the incumbent, whose testimony in any prosecution under the act shall be admitted in any court of justice in the State as that of an acknowledged expert, and whose charges for the analyses that may be ordered shall not exceed the following rates:—For soluble phosphoric acid, $4; insoluble do., $8; potash, $6; nitrogen, $4—the above charges to be paid by the State. The act is made to take effect Jan. 1, 1877.

Advertise in the Rural.—A subscriber at Sedalia, Mo., requests us to publish this terse query: "Will some of your numerous readers that have bronze turkeys for sale, advertise them in the RURAL NEW-YORKER?" We hope so, and also that a host of other people who have domestic animals, implements, trees, plants, seeds, etc., for sale, will not forget to remember that this is the season when our readers want such articles, and govern themselves accordingly. A brief advertisement in the RURAL pays the advertiser larger dividends than any other investment he could make. And readers should carefully peruse the advertisements at this season, for they will be sure to find many articles offered which they need. We often have letters asking where certain things can be had, which are at the time, or recently have been, advertised in the RURAL. Therefore, to one class we say, *Advertise*,—to the other, *Read the Advertisements*.

Are the People Corrupt?—We note with surprise the following paragraph from the New York Mail:—"When the country is honest and incorruptible Washington will be so. Washington simply reflects the character of the nation. We are buying the dear experience that politicians are time-serving and dishonorable. They are not so because they are Republican or Democratic, but because they are the representatives of a society that begets and breeds them. The reform must begin with the people, not with the rulers. When the people are honest they will have honest rulers—not till then." It is quite true that Reform must begin with the people; but there is no reason yet for believing that Reform will not begin. Long neglect often produces similar effects to corruption, but ought not to be mistaken for it. The people are not so bad as recent developments indicate.

"The Industrious Bee"—Is a decidedly profitable institution in this country, and ought to receive greater attention from farmers and others. For it is said there are 2,000,000 bee hives in the United States. Every hive yields, on an average, a little over twenty-two pounds of honey. The average price at which honey is sold is twenty-five cents a pound. So that, after paying their own board, our bees present us with a revenue of over $8,000,000. Over 20,000,000 pounds of wax are made and given to us by these industrious workers. The keeping of bees is one of the most profitable investments that our people can make of their money. The profits arising from the sale of surplus honey average from fifty to two hundred per cent. of the capital invested.

The Hog Crop.—Carefully-compiled statistics of the number and weight of hogs killed at five of the six heaviest Western packing cities show that the average weight is 9½ lbs. heavier than last year and 2 lbs. increase in lard. The number, however, has largely fallen off, and will be seven hundred thousand less than last year. The increased weight is mainly due to the scarcity of hogs and the large corn crop, much of which has proved to be of very poor quality. Hence, hogs have been kept later than usual to eat up the corn that could not otherwise be saved. The same cause is keeping back a large number of fattening cattle for the spring market.

A Phonographic Paper.—J. E. MUNSON, a prominent teacher of phonography, has initiated a new idea in the publication of the Phonographic News, to be published on the 1st and 15th of each month. In an eight page sheet it gives, in phonographic condensed form, a great amount of interesting reading—facts relative to phonographic history and exercises for beginners. Not being able to read it we have handed the manual to a lady friend interested in phonography. By-the-by, will the Editor of the News assure us that these hyeroglyphics do not constitute or contain a love letter? If such should prove the fact, consequences might be serious.

Sovereigns of Industry.—At the recent annual meeting of the New York State Council of the Sovereigns of Industry, held in Albany, the following officers were elected: President—Clark Witherby of Watertown; Vice President, W. T. Dean of Greenpoint; Secretary, P. L. Sandford of Elmira; Treasurer, J. F. Roberts of Elmira; Lecturer, W. J. Drake of Elmira; Steward, L. H. Waldorf of Elmira; Inner Guard, C. Bond of Greenbush; Executive Committee, Clark Witherby, W. J. Drake, P. L. Sandford and Jerome Terry of Albany; Delegates to the National Convention, H. R. Matteson of New York and Clark Witherby.

When the Food Cereal.—The people of Great Britain consume, on an average, 5⅓ bushels of wheat per year. The annual deficiency is from 80,000,000 to 100,000,000 bushels, and this year will be fully the larger amount. The average amount of wheat per head is larger in Great Britain than in this country. Oat meal in Scotland and potatoes in Ireland are not so largely used as Indian corn is in this country, and the prejudice in England against maize is, in many sections, nearly as strong as ever. It is increasingly used, but mainly for horses and cattle rather than as human food.

Death of a Journalist.—WM. S. ROBINSON, better known as "Warrington," the Boston correspondent of the Springfield (Mass.) Republican, died in Malden, March 11th, aged fifty eight years. Mr. ROBINSON was, for eleven years, clerk of the Massachusetts Legislature, and was a vigorous, able and honest political writer. At one time he was associated with the late Vice-President WILSON in the publication of a newspaper.

Various Inquiries.—Will some of the readers of your paper state what luck they have had with silver-hull buckwheat, yield, &c. Is it any better than the common kind? Will pear grafted on an apple amount to anything? One of my neighbors has one, grafted last spring, that looks nicely. Can you give the address of some dealer in Holstein cattle?—P.

RURAL BREVITIES.

WHEAT sowing has begun in Iowa.

POTATO BEETLES have appeared in some parts of New Jersey.

GREAT numbers of wild pigeons have appeared in Pennsylvania.

CHICAGO-killed beef is sold in Philadelphia at a great reduction in price.

FOUR THOUSAND cattle have died in Utah the past winter from cold weather and deep snows.

VICK'S Floral Guide, No. 2, for 1876—Rochester, N. Y.—is an excellent issue in both reading matter and illustrations.

HOVEY & Co. send us their Catalogue of Vegetable and Flower Seeds for the current year. It gives much interesting information.

BEES have worked on some of the fine warm days this winter in Peoria, Ill. "The little busy bee" does not often find much winter work.

JOHN SAUL of Washington City sends us his catalogue of new, rare and beautiful plants for 1876. The list is very full in all old varieties and embraces many novelties.

BRO. S. L. BOARDMAN of the Maine Farmer, has been elected a Councilman of the city of Augusta. —Have a care, friend, and don't become demoralized by ye wicked politicians!

F. K. PHŒNIX, the veteran Nurseryman and Florist of Bloomington, Ill., sends us price list of nursery stock and also catalogue of novelties in greenhouse and bedding plants.

SHORT-HORNS are usually bred for beef; but when bred for the Dairy, as has been done by W. G. MARKHAM of Avon, N. Y., they are excellent for Dairy purposes. See his advertisement in this paper.

AS will be seen by his advertisement, G. H. WARNER of New York Mills, has imported from H. BELDEN twelve very fine birds, which will add much to the value of stock he will send out the coming season.

A NEW machine for shearing sheep is a Californian invention. It facilitates the work immensely, makes the operation less disagreeable for the animals, and will probably be a great helper in the large sheep raising districts.

THOSE veteran seedsmen and horticulturists, HOVEY & Co., No. 53 North Market St., Boston, send us their Illustrated Guide and Seed Catalogue for the Centennial year. Their lists of $1 and 50c. packages of seeds are very attractive and can hardly fail to please. The catalogue is sent free to any address.

BUSINESS NOTICES.

Nellis' O. H. H. H. Fork and Patent Method for Mowing and Stacking Hay or Straw, will save the farmers its cost every season. Wanted Agents who can give reliable reference. Pamphlet free. Address A. J. NELLIS & CO., Pittsburgh, Pa.

An Extended Popularity.—Each year finds "*Brown's Bronchial Troches*" in new localities in various parts of the world. For relieving Coughs, Colds and Throat Diseases, the Troches have been *proved* reliable.

If you would insure good work, use only the **"Phœnix Pure White Lead."** Its whiteness, fineness and great body make it the most desirable paint.

WITHOUT AND WITHIN.

BY EBEN E. REXFORD.

Within, the light shone, and the room
Was full of faint yet sweet perfume;
The gay, glad music of the dance
Wrapped scene and sense in subtle trance.
And up and down in dizzy whirl
Swung fair-faced youth and happy girl.
Oh little dreamed they, dancing there,
How near was heart-break and despair.

Without, the wild wind rudely blew
The frost chill each their garment through,
As, standing by the window wide,
Looked in a beggar, hollow-eyed.
Looked in, and saw no trace of care
Upon the faces gathered there.
"How happy they must be," she said,
"And I,—have not one crust of bread."

So goes the world. The poor man waits
A beggar, at the rich man's gates,
And sees the pomp go on within
Of merry mockery and din.
Sees happy things pass out of reach
With yearning all too deep for speech.
While some in gilded halls may tread,
Some poor child lacks a crust of bread.

The Story-Teller.

LOVE IN ALL HEARTS;
OR, A FLOWER IN THE WILDERNESS.

Do you ever judge, reader, of the character of the inmates from the physiognomy of their houses? I do. And when the stage swept round the corner I looked out eagerly, for as the driver had told me, about ten rods up the road stood the house of Philander White. His wife was my mother's own cousin, and I was just thirteen years old when I went there to make my first visit. There had been some quarrel between the two families two or three-score years anterior to my visit; and though my mother and Mrs. White never participated in this, the feud of their ancestors had doubtless involved some coldness between them.

But to cut a long story short—for the pen and paper gossip may be more dignified but not a whit better than tea table scandal—I had been an invalid all the previous winter.

When soft April days (to which my mother looked forward so eagerly) came, they brought no bloom to my cheek, no vigor to my step. My constitution seemed to have lost all its recuperative power; and the doctor said: "Send her into the country, Miss May. If that don't help her she is lost to you."

Just before this Mrs. White had learned through a mutual friend of my illness, and the very day of the blunt physician's ultimatum bro't a letter to my mother.

"For the sake of my old love," it read, "let all that may have come between you and me be lost in the pleasure of better memories. The hills of Meadow Brook are clothed again with greenness, and now in this late May is the time for Jennie to come to us. There is a prophecy of health for her in the soft wind that lifts the edge of my paper as I write. We know she is your all, and we will be very tender of your darling. Will you not trust her for a single summer?"

And before another week was passed my trunk was packed and marked, "Philander White, Meadow Brook." I looked out, as I have said, and there sat the pleasant white house, with its green window blinds, the shrubbery in front, and the cherry trees behind. My heart went out to it, and at once; and it did a moment later to the gentle-voiced woman and the fair, dark-haired girl who rushed out on the broad front steps and kissing my cheek, said, "Cousin Jennie, you are very welcome."

But it is not all to tell you of that summer, though I look across the gray years to its picture in the Maryland of my memory that I have taken up my pen this morning. Suffice it that the mountain breezes of Meadow Brook did their work well; and when in early autumn my mother came for her child, she could hardly identify the rosy-cheeked girl who rushed in with her curls dangling about her face and held up her rosy lips for a kiss.

I think it must have been nearly two months after my domestication at Aunt Mary's—for so I call my mother's cousin—when Uncle Charles Brace, her husband's brother, visited her. He was a minister, and Cora and I had anticipated the gentleman's advent with anything but pleasant emotions. Our preconceived notions of the clergyman's elongated visage and solemn, puritanical manner, which we regarded as necessary concomitants of the profession, soon vanished before the beautiful kindling of his smile and the winning gentleness of his manner. He was Uncle Phil's youngest brother and not more than twenty-eight at that time; and his religion had deepened and harmonized his fine poetic temperament without checking the outflow of that under-current of humor which sparkled through his character. Uncle Charles was soon our companion in our rides and rambles, and our confidant in our girlish plans.

"You don't really mean so, Uncle Charlie," and Cora's bright face was lifted from the roses and geraniums we were weaving into the bouquet for the mantel. "You don't really think what you just said, that in every heart there is a fountain; some blossom in the human wilderness of every soul."

He put down his paper and came toward us. "I have not a doubt of it, my little girl. The story I was just reading of the hardened old man who cried because a child gave him a bunch of marigolds, corroborates my remark. The light that is in us cannot quite become darkness; the hearts that might bring forth a hundred-fold for harvests of heaven, will never become such deserts but some good seed will take root therein."

"I don't believe it would, though, in Farmer Keep. You don't know him as well as I do, Uncle Charlie. He's one of the richest men in all Meadow Brook; he's worth thousands and thousands. He's a bachelor, you know, and lives in the great red house on the road to Woodbury, you remember. Well, he never goes to church; he never loved a human being in his life. Now don't think Farmer Keep—why, Grandma Deane, how do you do?"

The lady whose entrance put this sudden period to my cousin's peroration, came slowly toward the rocking chair. Cora drew it out for her. She was the oldest lady in the village. The hair under her cap, white as hillside snow, had imprisoned the sunshine of fourscore and ten summers; but she still retained much of the physical stamina which, with her active sentiment, had made her so vigorous a woman for many years.

"What's that you're saying, child, about Farmer Keep?" said the old lady with a pleasant smile, as she plumed her knitting sheath to her waist.

"Why, I was telling Uncle Charlie what a cold, hard man he is. You've always known him, Grandma Deane, and now did he ever do a good thing or ever love anybody in his life?"

"Yes, he loved a girl once, I think I remember."

"Farmer Keep loved a girl once?" repeated Cora, with a half contemptuous and wholly skeptical curl of her red lips.

"She's forgotten," she added in an undertone to Uncle Charlie and me, for Grandma Deane was slightly deaf.

"No, I haven't forgotten, neither," she said, placing her hand on Cora's hair; "I have held Lucy Reid on my lap too often and rocked her cradle—poor, little motherless thing!—too many times to have forgotten."

Cora's look of incredulity was giving way to one of curiosity.

"Grandma Deane, won't you tell us all about it? Jennie and I will sit down on the stool, and I know by that look in Uncle Charlie's eye, he wants to hear it, too. Come, let the flowers go, Jennie;" and my vivacious cousin established herself at the old lady's feet.

Grandma Deane slipped the yarn around her little finger and commenced:—"Let me see. It cannot be more than forty-two or three years this summer since Justin Keep came up to Farmer Reid's to let himself out for the harvest boy, through harvesting. The Reid house stood a little this side of Stony Creek. There is nothing left of it now except the chimney, and it looks out gray and cold from the grass all about it; but forty years ago it was a fine old place, with lilacs, and the hop vines running all around the back. Lucy was hardly three weeks old when she lost her mother. Her father never married again and the child grew up there in the old home as fair and sweet as the flowers about her. She was turning into fifteen when Justin came that summer. He was a shy, strange sort of a lad, and the neighbors said Farmer Reid would never get the salt for his porridge out of him. He'd been bound out until he was eighteen to some man down in Maine, and he hadn't a relation in the world he knew of, nor a decent suit of clothes, when he came to Farmer Reid's house. But for all that, Justin proved a smart, likely boy; and the farmer, who somehow was never very beforehanded—I always thought his wife's sudden death hurt him—found that Justin was a real prize.

"At first he was gloomy and silent, doing his work and taking little notice of anybody. But he couldn't stand it long before Lucy. I wouldn't like to have the heart that that girl's smile would n't have thawed out. She was just like a bird around the old place, singing from morn till night, and her blue eyes, that were like her mother's, seemed to be sending out one laugh and her lips another. I never wondered her father doted on her as he did, and of course Justin wasn't long in the house before she tried to make friends with him.

"Poor fellow! it must have seemed very strange to him at first, for I don't believe anybody had given him a kind word until he came to Meadow Brook. But he made ladders for her flowering vines to run on, and got shells for the borders, and propped up the dahlias, and did a thousand other things which took them out into the garden after supper, and made them the best of friends.

"Lucy had a playful, childish way about her that made her seem much younger than she was; then she was small of her age, so that at fifteen she did not seem a bit older than you are, Cora.

"Well, she rode on top of Justin's hay cart and helped him husk corn in the barn, and pretty soon the farmer noticed a change in Justin. He got him a new suit of clothes, and his face lost its down look, and after harvesting Farmer Reid made him an offer to tarry all winter. So Justin stayed, taking Lucy's advice, and went to the district school and, though he had no education before, he went ahead of many an older scholar that winter. Justin stayed with the farmer four years; then he had a good offer somewhere in New York State, and concluded to stop for the winter only.

"Lucy Reid had grown into a young woman by this time; and a handsomer one, children, these dim eyes never looked upon. I don't know how it happened, for Lucy might have had her pick among the boys for miles around, but somehow she took to Justin; and when he left, they were engaged to be married one year from that time."

"Why, Grandma Deane! you ain't going to stop now?" cried Cora in alarm; for the old lady had laid down her knitting.

"No, my child," she said, moving her spectacles and wiping her eyes; "but the rest is a sad story, and I must hurry over it. I don't exactly know how it happened, but that winter Lucy's father got into a terrible lawsuit with Squire Wheeler. There was some flaw in the title, and the people said it was plain the old man should let the homestead go. They said too, he'd never survive it; and better perhaps, he never had, than kept it as he did; but one day Squire Wheeler, to all the neighborhood's astonishment, rode over to the farm.

"What he did there was never exactly known; but in a little while it was rumored that the suit was withdrawn, and next spring Lucy Reid was to be married to his son, Stillman Wheeler. And so it was. One bright March day she went to the old church yonder and gave herself to him. He was a good-looking man, but never over-smart, the neighbors whispered; and I always thought that it was his father's money, more than anything else, that kept him up."

"But Justin, Grandma Deane—what became of him?"

"There is a dark look about the whole matter. Lucy was made the victim of some terrible falsehood. I never blamed her father, for the losing of the homestead seemed completely to shatter him. I only know that Squire Wheeler and his son were at the bottom of it, and that Lucy Reid went to the altar, believing that Justin had been false to her."

"Dear me, how dreadful! Did he ever come back?"

"Yes, the next May. Lucy had been a wife two months. Justin had not heard of her marriage. She was at home visiting her father. When she first saw him she fell down like one stricken with a ill. But he carried her into the house and there learned all. Both had been deceived.

"It was a terrible scene the old front room witnessed. Justin swore vengeance, and it was not till, with clasped hands and streaming eyes the young wife knelt to the only man she ever loved and pleaded for the life of her husband, that he promised for her sake to spare his life. But from the day of Justin's visit Lucy was a changed woman. All the light and gladness of her being seemed dead in her. She moved about her house pale and quiet, with a look of patient suffering in her once sunny eyes that made my heart ache to behold."

"And her husband—did she ever tell him what she had learned?"

"I think not. His father and Lucy's had died in less than two years after the marriage. The Squire was much less wealthy than was supposed. The next spring Lucy and her husband moved West and somehow people lost sight of them."

"And Justin?"

"You know the rest, my child. He became a moody, unhappy man, asking no sympathy and giving none. But he was always smart at a bargain, and in a few years he had laid up enough money to buy Deacon Platt's farm when his son went South. Ever since, he has added acres to his lands and hundreds to the banks; but for all that, he is a man soured toward all his race—a man who was never known to give a little child a smile or a beggar a crust of bread. I have sometimes thought his heart was like a desert, without a tree to shade or a stream to gladden it. And yet it bore a bright blossom once; and believe me, children, for it is the word of an old woman who has seen and known much of the ways of man, it is always so. The heart may be a great wilderness, but in some of its byways there has grown a flower."

Cora and I looked at each other and at Uncle Charlie. Just then

FAITHFUL BRONZE.—(See page 207.)

Aunt Mary came in. She had been out, and not heard of Grandma Deane's visit. But Cora stole up to her uncle and, winding her arms about his neck, whispered:

"I shall believe it always, Uncle Charlie, now I have heard the story of Farmer Keep, that there is a blossom in the wilderness of every heart."

It was a sultry August day in the summer I passed at Meadow Brook. The wind, low and slumberous as the hush of a mother's voice at nightfall, crept up among the corn and down among the rye and wheat fields, that lay like broad green folds about the dwelling of Farmer Keep. There was no poem of flowers about the front yard; no graceful, harmonizing touches of creeping vine or waving curtains about the old red homestead; and yet it had a quiet, substantial, matter-of-fact physiognomy, that somehow made a home feeling about your heart.

I think it must have been this unconscious feeling which decided the course of the girl who stood at the point where the roads diverge, and gazed wistfully about her that afternoon. She seemed very tired, and her coarse straw bonnet and calico dress were covered with dust. If you had looked in her face you would not have forgotten it. It could not have been more than fifteen summers. It was very pale, and its sweet, sad beauty made you think of nothing but summer flowers drenched with summer rains. Her eyes were of that deep, moist blue that rolls out from under the edge of April clouds, and her lips, ripe and full, had that touch of sorrowfulness about them, which tells you always the heart beneath is full of tears. The girl's hand clasped tightly the little boy's by her side. The resemblance between them would have told you at once they were brother and sister, but his life could not have covered more than a third of hers. The little fellow's eyes were full of tears, and the bright curls that crept out from his hat were damp with moisture. A few minutes later she opened the broad back gate, and went to the kitchen door. Farmer Keep's housekeeper—an old woman with yellow nightcap, and check apron tied over her linsey wool skirt,—answered her knock.

"Do you want any help, or do you know of any round here that does?" timidly asked the girl.

The old lady peered at her with dim eyes. "No," said she. "There ain't but four on us—Farmer Keep and the two hired men, and me. It's harvest time just now, though, and I reckon you'd find a place in the village."

"Thank you. Bennie, here, my little brother, is tired, for we walked from the depot. Can you let us come in and rest awhile?"

"Surtain you can."

The sight of the child touched the heart of the woman, and they went into the large kitchen, and sat down in the rag-bottomed chairs, while, with a glowing cheek, the girl cast about in her mind for the best manner in which to present her petition for food. Before she had decided the master of the house suddenly entered the kitchen, for it was nearly dinner time. He was a large, muscular, broad-chested, sun-burned man, with a hard, gloomy expression on his face, where fifty years were now beginning to write their history. He stood still with surprise, gazing on the new occupants of the kitchen; and the boy drew close to his sister, and the girl threw up a timid, frightened glance into the gloomy face.

"You don't know of anybody round here that wants a little help, do ye, farmer?" asked the woman. "Here's a little girl that wants a place, and as she's walked from the depot, I told her she might come in and rest a bit before she went up into the village to try her luck!"

"No," shortly answered the farmer.—"Dinner ready?" And the rich man turned away without one gentle or kind look for two homeless children whom God had brought to his door.

"Lucy, Lucy, don't stay here. I'm afraid." And the little boy's lip curled and quivered as he turned his face from the farmer's.

"Lucy, Lucy," how those little, trembling tones went down, down, down into the man's hard heart! How the dead days of his youth burst out of their graves, and rushed through his memory at that low, broken, "Lucy, Lucy!" He turned and looked at the girl; not sourly, as before, but with a kind and eager questioning interest.

"What's your name?"

"Lucy Wheeler, sir."

He staggered back and caught hold of the nearest chair. "And what was your mother's?" "Lucy Reid. She used to live at Meadow Brook. So I came here to get work; she told me to before she died."

At that moment the angels looked down and saw the seed that had lain for two score years in the heart of Justin Keep, spring up, and the flower blossom in the wilderness. He strode across the kitchen to the bewildered girl. He brushed back her bonnet and turned her face to the light. He could not be mistaken. It was the one framed and hung in the darkened room in his soul. The blue eyes of Lucy looked again in his own. At that moment the little boy pushed in between them, and gazed wistfully in the man's face.—Farmer Keep sat down and took the child in his arms. He tried to speak, but instead, great sobs came and heaved his strong chest. The trio in the kitchen gazed at them in mute astonishment.

"Lucy's children, Lucy's children!" he murmured at last, in a voice whose tenderness was like that of a mother. "God has sent you to me. For her sake this shall be your home. For her sake I will be a father to you."

Five years after, Cora wrote to me:—"We are having fine times now, dear Cousin Jennie, and mamma wants to know if you do not need to renew your cheeks among the dews of Meadow Brook. Uncle Charlie is with us, and if you were also, our happiness would be complete.

"Lucy Wheeler—you remember her—has the place in my heart next to yours. Her disposition is as lovely as her face, and that is saying a great deal, for its sweet beauty does one good to behold it. Farmer Keep seems to idolize her and Bennie. He is a charming man now; he goes to church regularly every Sabbath. He spares no pains or expense in Lucy's education, and she will be an accomplished woman. She is here very often, and I have suspicions that Uncle Charlie—but no matter, I will not trust this to you and paper.

"But now, Jennie, what a lesson has all this taught me. How has it deepened my faith in God and humanity. Now when my heart yearns over the wretched, sinning outcast, I remember always that there is a flower in the wilderness."

The Literary World.

NEW PUBLICATIONS.

Why We Laugh. By SAMUEL S. COX, author of "Buckeye Abroad," "Eight Years in Congress," "Winter Sunbeams," Etc. [12mo.—pp. 387.] New York: Harper & Brothers.

"SUNSET" COX, as the author of this work is widely called, is entitled to the thanks of hosts of lovers of genuine, refined humor for this admirable analysis of "Why We Laugh." Himself a noted humorist, our author fully appreciates his subject, and illustrates it by references and quotations which must excite the risibles of the most sedate. The personal descriptions of American humorists and the selections from their best things—especially of Legislators and other public characters—comprise a large and most readable and enjoyable portion of this cachinnating encyclopedia. The author proves that many great men possess genuine wit and humor if all humorists are not great. We commend the book to all who would laugh and grow fat, whether at home or traveling, well or ill—and especially to the latter, for its perusal will promote health and good digestion. A gradual perusal of it during recent severe illness was most salutary in our own case, and we verily believe did as much toward our restoration as the remedies of a skillful physician. Hence we feel like tendering the author, as we now do, a vote of thanks for personal benefits received from "Why We Laugh."

Notes, Explanatory and Practical, on the General Epistles of JAMES, PETER, JOHN and JUDE. By ALBERT BARNES. [12mo. pp. 400.] New York: Harper & Brothers.

WE always open a book of this class, by whomsoever written, with involuntary respect—it is such a concentration of careful study. For centuries the labors of the finest minds have been devoted to explanation of the Scriptures, and there is no commentary extant that has not required for its preparation hundreds of years—that is, the knowledge of centuries on the subjects treated of must be examined and collated. But as truth strikes each mind at a different angle, and so moves in diverging lines, commentators come to different conclusions from the same evidence; and, besides, some incline to be diffuse, some concise. It is necessary, therefore, to read and study several different writers, to get at any thing like a well-rounded, clear perception of what the sacred writings contain—for though the writers may agree in substance, there is room for almost endless diversity in detail. The neat volume under notice is by one of the ablest writers and most profound thinkers this country has produced, and displays all the industry in selection, care in grouping and vigor of expression so noticeable in his other works. A most valuable book, and withal pleasant to read.

The French Principia.—Part II. A First French Reading Book Containing Fables, Anecdotes, Inventions, Discoveries, Natural History, French History; With Grammatical Questions and Notes, and a Copious Etymological Dictionary. On the Plan of Dr. WILLIAM SMITH'S "Principia Latina." [12mo.—pp. 395.] New York: Harper & Brothers.

The German Principia.—Part I. A First German Course—Containing Grammar, Delectus, and Exercise Book, with Vocabularies. On the Plan of Dr. WM. SMITH'S "Principia Latina." [12mo.—pp. 358.] New York: Harper & Brothers.

TEACHERS, and students of French and German, will find these elementary works most valuable. For beginners the plan adopted is admirable, as it enables them "to acquire the chief grammatical forms of another language, to learn their usage by constructing simple sentences as soon as they commence the study of the language, and to accumulate gradually a stock of words." The French Principia is a well-arranged reading book, with an excellent etymological dictionary.

Parlor Quarterman. A Novel. By WILLIAM M. BAKER, author of "Inside," "A Good Fear," &c. Illustrated by ELIAS J. WHITNEY. [8vo.—pp. 158.] New York: Harper & Bros.

IN the form of an autobiography, the author of this volume—personating the son of a distinguished Southern clergyman—presents a most interesting and instructive narrative. The pictures of Southern life, society, customs and personages, are most entertaining, and evidently derived from experience and close observation twenty to thirty years ago. It is altogether a charming book, with an excellent moral tendency.

Text-Book of Scientific Agriculture, with Practical Deductions. For the use of Colleges, Schools and Private Students. By E. M. PENDLETON, M. D. [12mo.—pp. 443.] New York,: A. S. Barnes & Co.

As a manual of Scientific Agriculture, this book will have a use even more important than that prescribed in its title, as a text-book in colleges and schools. The thousands of practical farmers who are often puzzled by hard questions in their avocation, will find in this book the clear, satisfactory and scientific answer which they need. We have read much of the book with great interest and profit, and can heartily commend it to our readers. The author is Professor of Agriculture and Horticulture in the University of Georgia, and the work was originally prepared to meet the want of a practical text-book for his pupils.

Robinson Crusoe's Money; Or, the Remarkable Financial Fortunes of a Remote Island Community. By DAVID A. WELLS, late U. S. Special Commissioner of Revenue. With Illustrations by THOMAS NAST. [8vo.—pp. 118.] New York: Harper & Bros.

OUR author treats the intricate subject of finance by the use of an ingenious parable, which will please the advocates of hard money and make converts to the doctrine. The book is a spicy and timely one, and will attract wide attention—now the currency question is being so generally discussed. The lively illustrations by NAST will prove more effective with many than the rigid arguments which some writers bring to the elucidation of the vexed question.

The Language of Flowers and Floral Conversation. By UNCLE CHARLIE. Second Edition. Rochester, N. Y.: James Vick.

THIS is a neat little brochure, which will delight the lovers of flowers, and especially young people. It contains poetical selections from the best authors. The section devoted to floral conversation, among other good things contains a fascinating story. There is also a section devoted to the sentiments of flowers and floral decorations, treated in reference to special occasions, such as Thanksgiving day, Christmas, etc. A chapter on cemetery decorations—and others on preparing skeleton leaves, drying flowers, autumn leaves, sea mosses, etc.,—renders the work useful, in addition to its being sentimental.

On Dangerous Ground; or, Agatha's Friendship. A Romance of American Society. By Mrs. BLOOMFIELD H. MOORE. [12mo.—pp. 330.] Philadelphia: Porter & Coates.

THE moral of this admirable society story is excellent. The heroine finds that mere friendship—Platonic Love—is dangerous, as the sequel proves. The delineations of society, and the characters and characteristics of every-day life, are truthful, and the whole story is interesting and entertaining. Though Mrs. MOORE is an amateur writer the volume before us is worthy of a professional in all respects, and we trust will be followed by others from the same graceful pen.

Miriam's Memoirs. A Sequel to "Montfort Hall." Being a Romance of the House of Beauseincourt. By Mrs. CATHARINE A. WARFIELD, author of "The Household of Bouverie," "A Double Wedding," &c., &c. [12mo.—pp. 406.]

ALL who have read "Montfort Hall" will be delighted with this volume, as it continues the fortunes—the adventures and hairbreadth escapes—of the heroine. The tragic portions of the story include murder, suicide, etc., and, although well written and of moral tone, is sufficiently sensational to chain the attention of the reader throughout the exciting narrative.

Sea and Shore. A Sequel to "Miriam's Memoirs." By Mrs. CATHARINE A. WARFIELD, author of "The Household of Bouverie," &c., &c. [12mo.—pp. 332.] Phila.: T. B. Peterson & Bros.

THIS is an exciting romance, the heroine being an heiress with a base and intriguing guardian. A shipwreck and narrow escape, and subsequent confinement as a lunatic, on a false charge, add to the absorbing and almost tragic interest of the story. The volume is entrancing from its opening, and will augment the popularity of Mrs. WARFIELD.

The Squire's Legacy. A Novel. By MARY CECIL HAY, author of "Old Middleton's Money," &c. [8vo.—pp. 172.] New York: Harper & Bros.

THIS volume (being No. 455 of HARPERS' Library of Select Novels) comprises a capital English story, with a commendably conscientious and moral hero. It is one of those works which are calculated to exercise a salutary influence upon the reader.

The Count of Morcf; Or, Richelieu and his Rivals. Translated from the French by HENRY L. WILLIAMS, Jr. By ALEX. DUMAS. [8vo.—pp. 160.]

THIS is a cheap reprint of one of DUMAS' very Frenchy sensational works, and, judging from the picture which embellishes the front of its yellow cover, it must prove sanguinary reading.

LITERARY NOTES.

MRS. OLIPHANT'S new novel, "The Curate in Charge," is to be published by the Harpers.

MR. FRANCIS ABBOTT writes of "The Catholic Peril in America," in the Fortnightly Review.

MISS AMANDA M. DOUGLASS has written a new story, "Nelly Kinnard's Kingdom," a tale of home life, which will be published by Lee & Shepard.

THE April Number of the Galaxy contains a great variety of interesting literature, and fully maintains the high reputation of this magazine.

COL. T. W. HIGGINSON has been engaged to prepare "A History of the Growth and Development of the Public School System of the State of Rhode Island," to be sent to the Centennial Exhibition.

A SECOND volume of "Truths for To-day," by Prof. David Swing, is to be printed by Jansen, McClurg & Co., Chicago. This will comprise many of his recent sermons to his new congregation.

THE final volume of the new edition of Mr. Bancroft's History will contain an elaborate index of about a hundred pages, which Mr. S. R. Crocker of Boston, editor of The Literary World, is now compiling.

Sabbath Reading.

DON'T DRINK TO-NIGHT.

I LEFT my mother at the door,
My sister at her side,
Their clasped hands and loving looks
Forbade their doubts to hide.
I left and met with comrades gay,
When the moon brought out her light,
And my loving mother whispered me,
"Don't drink, my boy, to-night."

Long years have rolled away since then,
My jetty curls are gray,
But oh! those words are with me yet,
And will not pass away.
I see my mother's loving face,
With goodness, radiant light,
And hear her words ring in my ears,
"Don't drink, my boy, to-night."

My mother is now resting sweet
In the graveyard on the hill;
But her kind words come back to me
And haunt my memory still.
I've often, often passed the cup,
Oh! then my heart was right,
Because I heard the warning words,
"Don't drink, my boy, to-night!"

I've now passed down the road of life,
And soon my race is run;
A mother's warning listened to,
An immortal crown is won.
Oh, mothers, with your blessed smile,
Look on your boys so bright,
And say as you alone can say,
"Don't drink, my boy, to-night."

Those words will prove a warning when,
In the thorny path of life,
Thy boy is in the tempter's wiles,
And warring in the strife.
Thy words will stop the morning cup,
And revelry at night,
By whispering back a mother's voice,
"Don't drink, my boy, to-night."

FLOWERS AT FUNERALS.

SOMEBODY has been showing that the expense of a first-class funeral in New York is something over two thousand dollars, monument and all. Of this the cost of flowers is set down at a hundred dollars. Now, a hundred dollars spent in flowers may be a piece of extravagance or economy, as people choose to regard it. But we venture to say that twenty-five dollars judiciously expended will make, we will not say a better display, but in all respects a more beautiful and appropriate token of esteem and affection. Immense stacks of flowers are bad enough in churches, but at a funeral they are extremely out of taste. What is wanted is some proper token of affection on the one side, and on the other some suggestive symbol of an unfolding and beautiful hereafter.

But, how stands the case when all taste and simplicity, and especially when all true suggestiveness, are sacrificed to an immense show? Think of those hideous crowns done up with violets and pinks, which it is safe to say no saint would wear, to say nothing of mortals. And think of flowers being packed together like so many sardines! beautiful pinks and lilies enough to occupy half the room being gathered up in the compass of a square foot. It is as if a milliner, in order to make a big display on opening day, should gather up in some huge bee-hive 200 or 300 hats and feathers, all crushed and crowded, in order to suit her fancy. How would the ladies like that as a specimen of taste? But, there would be much more taste in it than there is to much of this massing and crushing up flowers by us much as a hat is a less delicate and beautiful object. If milliners could be paid for such an abomination as we have spoken of, they would probably be guilty of it. And this is just the real trouble with the florists; it is a question of sticking in as many flowers as possible at so much a piece. And the result is so much ugliness, and a hundred dollars to pay for it.—*Church and State.*

A GOOD RULE.

THE best rule for Christian people to observe is to tell folks of only what will give them pleasure. Whoever speaks a word that causes a heartache, sins. Whoever disturbs the peace and tranquility of a mind, even by rehearsing any perambulating gossip, lessens the joy of a life to whose joy it is his duty, in Christ to minister. Life is too short and joys too few, for us to mar the peace of the one or lessen the number of the other. If any reader of these lines has been in the habit of telling people unpleasant things, we sincerely hope the perusal of this article will cause him to stop doing so. He is taking liberties with human happiness that are unjustifiable. He is starting tears in many eyes and filling many hearts with bitter feelings. If he is thoughtless in doing this, he is simply rude; if his rudeness is spiced with malice, he bears close resemblance to one whose name we will not mention, but which any one can easily guess. "If any man among you seem to be religious and bridleth not his tongue, but deceiveth his own heart, this man's religion is vain, —*Golden Rule.*

USEFULNESS and noble acts are the most radiant epochs in the biography of men. When wrought in earliest youth, they live in the memory of age, like the Coral Islands, green and sunny amid the melancholy waste of ocean.

THE frowns of the world are among the blessings of the Christian. The property of fools shall destroy them. "He whom I kiss," said Judas, "take him;" so when the world kisseth, it often betrays.

Ladies' Portfolio.

KATE.

THERE'S something in the name of Kate
Which many will condemn;
But listen, now, while I relate
The traits of some of them.

There's deli-Kate, a modest dame,
And worthy of your love;
She's nice and beautiful in frame,
As gentle as a dove.

Communi-Kate's intelligent,
As we may well suppose:
Her fruitful mind is ever bent
On telling what she knows.

There's intri-Kate, she's so obscure,
It is hard to find her out,
For she is often very sure
To put your wits to rout.

Prevari-Kate's a stubborn maid,
She's sure to have her way;
The cunning, caviling young jade
Objects to all you say.

There's alter-Kate, a perfect pest,
Much given to dispute;
Her prattling tongue can never rest,
You cannot her refute.

There's dislo-Kate, quite in a fret,
Who fails to gain her point;
Her face is quite unfortunate,
And sorely out of joint.

Equivo-Kate no one will woo,
The thing would be absurd;
She is so faithless and untrue,
You cannot take her word.

There's vindi-Kate, she's good and true,
And strives with all her might
Her duty faithfully to do,
And battles for the right.

There's rusti-Kate, a country lass,
Quite fond of rural scenes;
She likes to ramble through the grass,
And through the evergreens.

Of all the maidens you can find
There's none like edu-Kate;
Because she elevates the mind,
And aims at something great.

WHIFFS FROM CANADA.

No. I.—Gardening for Girls and Boys.

Such a breeze! You would think it was a March wind if the almanac did not declare it the fifteenth of April. It has been a cold month so far; the buds that have been swelling so long do not know whether to open or not. But we *must* have peas, and out into the garden we troop, for it is Saturday and the children are out of school. Mother is teacher in our house and every other day in the week we do up our work in the early morning in time for nine o'clock lessons. There are three girls of us—MAYSIE, ANNIE and MINNIE—and for a good many years we have been taught at home. We take turns with the work. One week MAYSIE is cook, ANNIE housemaid, and MINNIE nurse; that is, we assist in those departments of work. I like to be cook, for then I can beat the eggs with my patent Dover egg-beater, and help at making pies, besides making the bread and getting a little loaf for myself, which mother always lets the cook have when the baking is finished. Then I like to be housemaid, for then I make the beds and try how neat I can keep the rooms when I dust; and I like to be nurse, for baby HOPE puts her little arms around my neck when I dress her and offers me kisses, and when I put the boys to bed for mother they say, "Good-night, sister ANNIE; I like you."

But to-day we are all in the garden. The work is finished indoors and papa says, "Let us sow peas," Oh! the sweet, fresh breeze of an April day. How glad we are to get out of doors, for since October's close we have not seen a blade of grass—just snow, snow and ice, until we sometimes feel like moving South in spite of our dear and beautiful home. Here comes STANTON with the reel and line. We always have the ground ready in the fall, "drilled," papa calls it; and with a seed sower in WILLIE'S hand they go to one end of the drill, dropping, dropping, the seed of "Carter's First Crop," which is our earliest pea. Then as the small roller covers them STANTON follows and with his little feet presses the earth down firmly in order to keep them from the sharp-eyed ducks and hens that roam the garden at this season of the year in search of earth worms, but do not refuse a vegetable diet when handy. There, they are finished, and papa is putting into the sewer a round, brownish-red seed, mixed with a larger, jagged-looking seed. "Can these grow together?" asks MINNIE. "Oh, yes," answers papa; "the first smooth little seed is radish—the last I put in blood beet. The radishes germinate quickly, are grown and pulled up to eat before the beets are any size, and the space they have occupied leaves plenty of room for the beets to grow. This saves thinning and transplanting, while at the same time the ashes we are obliged to put over the radishes is equally needed for the beets, which are subject to the attacks of a very hungry fly."

"What are you going to do now? Oh, yes, the seed bed." WILLIE is bringing rich manure from the stable in a wheelbarrow. MAYSIE is carrying over the marker and seed, and now papa has mixed the earth thoroughly and is drawing lines eight or nine inches apart. Here he puts in celery, lettuce and cauliflower seed, pats the bed over with a spade and leaves it. We find this plan better than a hotbed, because the plants are stronger and bear transplanting better in the hot weather, for celery and cauliflower are only a second crop; after the peas and early vegetables have had their last hoeing we take the chance of a shower to put in our celery between the rows, which are wide. The constant working which these require through the fall keeps the ground clean, papa says.

There! the Convent bell rings six, and in Canada everybody stops working when the vesper bell tells them. If you had twenty people hoeing or picking hops or apples, they would not ask you when to stop, but as soon as that vesper tune rings out they let the burden of the day fall off their shoulders, and with a gay "*bon jour*," start off for their little whitewashed cottages, content and light hearted. The little gray birds are nowhere to be seen now—the Star of Bethlehem has closed its white starry flowers and the snowdrop droops its tiny bell. To-morrow we will work in our gardens, which is work we all love. Our little plots of ground were given to us by mother, and now, as there are nine of us, we have quite a variety of fancy flowers and vegetables growing in them that I will tell you about next time.

ANNIE L. JACK.

REMARKS.—Thanks to our fair correspondent for her advance article on working in the garden. We trust it will induce many of our young readers to cultivate vegetables, flowers, etc., this season—on plats of ground given them for the purpose by their parents.

MAPLE BUDS.

No. III.—A Plea for the Children.

BY MAY MAPLE.

"I NEVER allow my children to eat between meals," said Mrs. PROPRIETY, after little JESSIE had gone out of the room. The little one had just asked for a "little, teenty piece of bread, 'cause I's so hungry," and having been refused by her overly-precise mother, and had gone out to the playground with a pearly tear ornamenting each delicately tinted cheek, and a little ache in the heart for the empty little stomach that felt *so tired*.

Dear little one, how my hands ached to get for her the much-coveted lunch! And no doubt my tell-tale face exposed my sympathy; for Mrs. PROPRIETY continued:—"When children are allowed to eat at all hours, they seldom have an appetite to eat what is set before them at the regular time; and then it makes so much work to keep the pantry in order, with three or four pairs of little hands to scatter crumbs, and as many feet to make tracks. Besides, many professors of science teach us that it is decidedly unhealthy. So, taking all these things into consideration, I have concluded that it is better not to allow them pieces between meals."

I made no reply, knowing that it would be worse than useless to argue the point with one who had so little sympathy for children. Nevertheless, I determined to enter a serious protest against such barbarous cruelty. It may do very well for physiologists to make rules, but people should remember that *all* rules have various exceptions. There is no doubt but the digestive organs should have time to perform their allotted duties. We are told, too, that we should *rest* at least an hour after eating, before attempting physical or mental labor. Who obeys this injunction? Not one worker in fifty; certainly not the little active one, who has houses to build, farming tools to create, mill-dams to erect, doll houses to care for, flowers to gather, butterflies to catch, birds' nests to hunt, and a thousand and one steps that mamma knows nothing about, besides as many more, for parents, brothers and sisters.

Now if one is to take the Physiology for a guide, it is necessary to mind *all* its precepts and not select one rule and make all organizations succumb to that. Nature tells the little child or grown-up individual when the stomach requires refreshments much better than science. The child is called in the morning, long before it has had its natural sleep, to eat its breakfast. Of course it has but little if any appetite; a few mouthfuls is sufficient; and then think of going from five to seven hours without tasting food! Ugh!—it makes one faint to think of it.

But, you say, the child will eat a hearty dinner, and make up for the breakfast. Possibly; but be assured if it does it will overload the stomach, causing derangement and inflammation. But it is more than likely that the child will have passed the time when dinner would relish, and again very little food is required. By-and-by mamma and papa begin to wonder what ails JENNIE. "Why, she doesn't eat enough to keep a chicken alive." She grows thin and pale week by week; a slow fever sets in, and she is confined to her bed. A long fit of sickness is the result; and caused by *actual starvation* in her own father's house, where there was bread enough and to spare.

Mother EVE set us an example, thousands of years ago, before scientists were born, TO EAT when we were hungry. Do you think Satan himself could have tempted her to eat of the forbidden fruit if she hadn't felt "a sort of goneness" in the region of the stomach? Most certainly not. She would have been supplying herself with flowers, wherewith to deck herself and her dear ADAM, or gazing with fond looks into her husband's eyes, wherein in she would behold her own fair face as in "a glass darkly."

Don't forget the hungry children, nor turn a deaf ear when they ask for bread.

To a liberal mind poverty is a stimulant, meanness a refrigerant, selfishness an opiate, and ingratitude a poison.

Reading for the Young.

OUR LITTLE MAN.

WOULD anybody like to know
Why it is we call him so?
Why we call him "our little man?"
Merry, jolly, seven-year-old Dan?

'Tis because he's willing to do
Everything that we ask him to:
Never pouting or making a fuss,
Always cheerfully helping us.

Ever ready to leave his play
When he's wanted in any way;
Often asking for something to do,
Saying, "Mamma, I love to help you."

Picking up things about the room,
Sweeping the steps with his little broom;
Playing with baby, shelling the peas—
How he helps mamma in things like these.

Watering the garden, pulling up weeds,
Running errands for what mamma needs,
Making the yard look tidy and neat—
Thus he spares his dear papa's feet.

Then of himself he takes good care,
Even brushes and combs his hair;
Keeps his hands and face so clean,
Never a neater boy was seen.

Useful and happy through all the day,
Ready for work and ready for play;
Do you wonder that dear, hopeful Dan
Goes by the name of "Our little man?"

[*Mrs. F. A. Percy.*

FAITHFUL BRONZE.

[SEE ILLUSTRATION ON PAGE 205.]

THE noontide was warm, and Miss Gladys sat upon a rock to read. As she did so a tiny skiff skimmed along as near the land as the shallow water would let it. When the sailor who was in it saw her, he waded to shore and came to her. He was a good, simple fellow, who lived in one of the huts on the beach, and worked sometimes with colliers, sometimes with fishing-smacks. He was full of trouble now, and poured his sorrow out to her. It seemed that he had been on shore seeking her. His wife, who was on board a fishing-smack that lay off the land, some mile or so westward down the coast, was very ill—dying, he feared—and had begged of him, if he could find Miss Gladys, to entreat of her to go and speak to her. He had been compelled to come to the village for bread, and tackle and other things he needed, but he could not find the doctor. This woman was a delicate, pretty, good-living creature, and Miss Gladys had won her heart with many little services in the drear winter-time gone by. It was a common thing with her to visit the people on board their vessels, for she loved nothing so well as to sail to and fro on the sea. She told the sailor that she would come at once.

"Come!" she called to her faithful dog, Bronze; but the sailor stopped her.

"I dare not take him, miss—not for our lives!" he said. "He's the weight of a man; and the boat is overcrowded now with the things as I've had to get: you're to the full as I dare carry."

"I cannot leave him!" she answered, shrinking back: and, indeed, she never had left him. He was always with her, whether on sea or land.

"I can go and come for you again, miss," said the fisherman ruefully: "but it will take a goodish bit of time—and Jenny so bad, and nobody but the boy with her, and the doctor not to the fore neither! Surely the dog'll wait for you here, miss, safe enow? Not as I'd be pressing you."

But he did press her—pressed her sorely. It was very reluctantly that she consented to leave Bronze there. Nothing but the thought of the sick and lonely woman would ever have persuaded her. As it was, she threw her arms about him and kissed her dog fondly, and then pointed to the basket of shells and sea-weed on the red, smooth piece of rock.

"Take care of them, Bronze," she murmured, "and wait till I come back. Wait here."

She did not mean to command; she only meant to console him by the appointment of some service. Bronze looked into her face with eyes of woe and longing, but he made no moan or sound, but only stretched himself beside the basket on guard.

The boat flew like a sea-gull over the waves, the sun bright upon her sail. Bronze, left upon the rock, lifted his head and gave one long wail. It echoed woefully over the wide, quiet waters. Nothing was in sight except that single little sail shining against the light, and flitting, flitting away.

Bronze never moved, and his eyes never turned from the little boat that had gone and left him there. An hour drifted by, and ere long the sand, hitherto so smooth and beautifully ribbed, grew moist, and glistened with a gleam of water, like eyes that fill with tears. Bronze never saw: he only watched the far-off boat. A little later the water gushed above the sand, and gathering in a frail, rippling edge of foam, rolled up and broke upon the rock.

And still he never saw, for still he watched the boat. A while, and the water grew to volume, and all around the tide rose silently about the rocks and stones, gliding and glancing in all the channels of the shore, until the sands were covered.

The waters rose till they touched the rock; but he never moved. Stretched out upon the stone, guarding the things which his mistress had left in his care, and with his eyes fastened on the sail which rose against the light on the distant horizon, he waited for death.

His mistress had not forgotten her faithful companion. As soon as she reached the fishing-smack where the sick woman was she begged the sailor to go back and see to Bronze. He went, and as he neared the rock he saw the brave dog awaiting death. Just as the sailor, straining his weary arms to reach the shore, came in sight of it, a great wave surged over the dog, breaking upon him and sweeping him away. He rose, grasping in his teeth the basket of weeds and shells. He had waited until the last. Driven from the post which he would not forsake, the love of life awoke in him, and of his own will he struggled against death.

Three times he sank, three times he rose. The sea was now strong, and deep and swift of pace, rushing madly in; and he was encumbered with shells and the weighty basket with its sea-weeds, which yet he never yielded because it had been entrusted to him by his mistress. The sailor, weary though he was, bent to the oar, while he shouted words of cheer to the brave dog battling with the waves. And to his joy, before faithful Bronze was sucked down by the hungry waves, he grasped his collar and pulled him, spent and panting, into the skiff, grasping still the basket in his teeth. And then the sailor rowed wearily and slowly through the gathering night to the fishing-smack, where Miss Gladys, as a ministering angel, was tending his ailing wife. With joy she welcomed the companion of her solitary wanderings, and when she heard the story of his faithfulness, even unto death, she threw her arms round his neck and caressed him, resolving never again to put his fidelity and obedience to so terrible a test.

"THAT'S HOW."

AFTER a great snow storm, a little fellow began to shovel a path through a large snow bank before his grandmother's door. He had nothing but a small shovel to work with.

"How do you expect to get through that drift?" asked a man passing along.

"By keeping at it," said the boy, cheerfully; "that's how!"

That is the secret of mastering almost every difficulty under the sun. If a hard task is before you, stick to it, and little by little it will grow smaller, until it is done.

If a hard lesson is to be learned, do not spend a moment in fretting; do not lose breath in saying, "I can't" or "I do not see how;" but go at it and keep at it—study. That is the only way to conquer it.

If a fault is cured or a bad habit broken up, it cannot be done by merely being sorry, or only trying a little. You must keep fighting until it is got rid of.

The Puzzler.

BIBLICAL ENIGMA.—No. 4.

I AM composed of 29 letters:
My 1, 12, 19, 4, 13, 28, 15 was a province of Syria.
My 5, 17, 1, 8, 11, 7, 8 was a Corinthian convert under Paul's preaching.
My 8, 21, 16, 4, 24, 10, 14 is a bird which feeds mostly on winged insects.
My 12, 16, 19, 6, 17, 5, 15 is an evergreen tree.
My 16, 12, 1, 25, 3, 26, 20 is a fallen angel referred to in Revelations.
My 17, 1, 27, 9, 12, 26, 14 is a beautiful natural phenomenon.
My 22, 2, 17, 10, 29, 13, 23 was a reservoir of water at the foot of Mount Zion.
My whole is part of a verse of the Bible.

☞ Answer in two weeks. ISOLA.

CROSS-WORD ENIGMA.—No. 7.

My first is in waltz but not in dance,
My second is in saber also in lance;
My third is in ship but not in boat,
My fourth is in ditch but not in boat;
My fifth is in gain but not in loss,
My sixth is in turf but not in moss;
My seventh is in some but not in more,
My eighth is in window but not door.
My whole gives the name of one both great and good. YOUNG SCRIBBLER.

☞ Answer in two weeks.

HIDDEN TREES.—No. 2.

1. ARE you fond of tea, Kittie?
2. Mary will do a kindness cheerfully.
3. Repent, ye wicked ones.
4. Here is Caleb on your horse.
5. I saw a camel Monday afternoon.

☞ Answer in two weeks. C. S.

PUZZLER ANSWERS.—March 11.

FARMER'S ENIGMA No. 1.—

"He who by the plow would thrive,
Himself must either hold or drive."

TRANSPOSITION No. 1.—

LET fate do her worst there are relics of joy,
Bright dreams of the past which she cannot destroy,
Which come in the night-time of sorrow and care,
And bring back the features that love used to wear.
Long, long lie my heart with such memories filled,
Like the vase in which roses have once been distilled;
You may break, you may shatter the vase if you will,
But the scent of the roses will hang round it still.

BIBLICAL DOUBLE ACROSTIC No. 2.—Initials, Corinth; finals, Goliath.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forgot to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money in *the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

THE GREAT STORM IN EUROPE.

LONDON telegrams of the 12th inst. tell fearful tales of the disastrous storm which occurred last week all over the Continent of Europe. A furious tempest, accompanied by such torrents of rain that the great rivers were swollen and many villages swept out of existence, extended from Havre to the eastern limits of Slavonia. One dispatch says:—"The present week has been the stormiest which has been experienced in England during the past hundred years. There have been terrible gales, storms and floods in England, France, Germany and Belgium." The damage was of course great and wide-spread—ruin and death leaving their marks on both densely and thinly populated districts. The devastation spread over land and sea—for while villages and crops were destroyed inland, many vessels and their crews were engulphed in the aerial vortex along the coast. The storm caused terrible inundations in Germany. Houses were unroofed, the steeples of churches blown down, telegraphs prostrated and railroad tracks blown away. Earthquake shocks were felt in several places during the prevalence of the storm. The inundations in many places over the Continent have injured the young crops, so that a new sowing will be necessary. In Bohemia and Hungary enormous tracts of country and above a hundred townships have been flooded. "In Hungary the total loss, as foreseen, will amount to $10,000,000, of which one-half falls on the agricultural interests. Sixteen hundred thousand acres of arable land in Hungary are still inundated." The loss of property by this unparalleled and widespread storm is incalculable, and the terrible catastrophes accompanying it will long be mournfully remembered.

ANOTHER TERRIBLE TORNADO.

THE village of Hazel Green, on the Southern borders of Wisconsin, was almost entirely destroyed by a tornado on the 16th inst. The tornado came up on the afternoon, and seemed at first like a very black cloud which divided and then reunited. It plowed the ground six hundred feet long and four or five feet wide, taking up stones, dirt and debris of every kind. The head of the column was a huge stone, eight feet long four feet wide, and one or two feet thick. This with other matter was suspended in the air and hurled on the village, striking with greatest force Masonic Hall, a huge stone building, which it crushed to the earth. Fortunately the hall was empty, though a meeting had been called for half an hour later. A large number of smaller buildings were destroyed, and many almost miraculous escapes are recorded. In one house the entire family were instantly killed, and when taken out a young girl had the baby in her arms, both dead, while her mother had some samples of cloth, clotted with blood, which she was showing when the disaster occurred. A span of horses were taken up by the whirlwind sixty or seventy feet in the air, carried a distance of several hundred feet and left dead, not more than ten feet apart. The following is a list of the killed and injured:

Killed—Mrs. E. Richards; Johnson Richards, aged 18 years; Lizzie Richards, aged 16 years; Mrs. T. H. Edwards and child; Alfred Jackson, aged 4 years; Thomas Allen and son, and Mrs. John Looney.

Injured—Joseph Clementson, leg broken; Edward Thompson, hip injured; child of Fred Plude, arm broken; Amanda Morcom, head cut; Thomas Magor, badly cut in the face; Mrs. Tregonin, arm injured; Joseph Mason, slight injury on the head; child of William Piddick, head cut; Dora Thompson, arm injured; Mrs. Joseph Jackson, injured; Mrs. James Edwards, face hurt; James Treganza, injured slightly; Frank Thompson, arm bruised; Miss Eliza Rodda, badly injured. Several in the family of Thomas Allen are reported as badly injured.

Hazel Green was a village of 1,000 inhabitants. Since the destruction of most of the buildings, a great horror has fallen on the people, and it is believed that it will never be rebuilt.

HOME NEWS PARAGRAPHS.

THE Rhode Island Democrats have nominated Gen. Geo. L. Cooke for Governor.

A party of 400 people from the Northwest are being publicly entertained in Georgia.

It is charged that part of the Kentucky Central award went to Mrs. Belknap; Mrs. Marsh is wanted as a witness now, but was allowed to escape to Canada.

Over 30 Representatives in Congress are sick, including Mr. Cox, most of them from the bad ventilation of the House.

Last week the Inflationists of New York met at Syracuse and adopted a platform, claiming to be the real Democracy, resolving to send delegates to St. Louis, and calling for laws requiring the payment of all debts in paper money; Richard Schell was President.

The State Democratic Convention to elect National delegates is appointed for April 26 at Utica.

The Colorado delegation to the Republican National Convention at Cincinnati, it is understood, will go unpledged.

The completion of the Atchison, Topeka and Santa Fe Railroad shortens the time-table from New York to Colorado about twenty-four hours.

The gold and silver mines recently discovered near Pike's Peak, have proved very rich, and stamp mills and smelting works are about to be established at Colorado Springs.

The Society of Alumni of the Virginia Military Institute proposes to erect a monument on the parade ground at Lexington to the memory of the cadets who fell during the war.

Pronouncing matches are rapidly taking the place of spelling bees in California, the prompter spelling out the names of local towns, and the competitors being obliged to pronounce them correctly.

A Chinaman on the passage to California jumped overboard intending to kill himself, but in some unaccountable manner was lodged in the wheel-house of the steamer, where he clung tenaciously, although the utmost exertion was necessary too escape the death he had sought. He was nearly dead when discovered. Upon being restored he cut his throat effectually.

A miner named Munson recently found in the Globe mining district, Arizona, a solid mass of metallic silver ore lying on the surface of the ground and weighing 2,200 pounds. A careful and low assay of it showed it to be almost a mass of pure silver and worth $20,000 at least.

The Convention to form a Constitution for the Centennial State of Colorado completed its labors and adjourned sine die March 10. The instrument will be submitted to the people on the first day of July, and if approved by them, Colorado will vote for the next President of the United States.

At a meeting recently held in San Francisco by a society for the promotion of the Christian religion among the Mormons, ex-Gov. Wood of Utah and Oregon, the Chairman, said that the best method of carrying out the object of the society was to court martial the Mormon leaders and then hang them as criminals.

A deer in Moriah, N. Y., close by the North Woods, has distinguished himself by nearly killing a man. The animal, a fine buck, rushed upon the man suddenly and trampled him.

In the year 1875 Chicago had 526 divorce suits, out of which 284 divorces were granted; 70 were denied, and 171 cases were not disposed of. The cause of all this misery was—In 174 cases, desertion; in 157, cruelty; in 111 adultery; in 69 drunkenness, in the remaining 15, mixed.

There are 1,234 men, 36 steamers, 27 vessels, and 18 factories engaged in the oil and guano business of Maine. During 1875 no less than 712,000 barrels of fish were taken, an increase of 90,000 over 1874, and 1,800,000 gallons of oil made, an increase of 21,000 gallons. The amount of guano prepared was 22,000 tons.

There is a prospect that the Hudson River Iron Works will soon start up again, under the management of the new proprietors.

The dirt and stone work on the new Amsterdam reservoir cost $27,755.39. This, taken with the land damages, engineering and other incidentals, will probably swell the cost to about $40,000.

The missing Spaniard, Senor Jose Holgardo y Cruces, who was supposed to have been kidnapped, has been found at the Eastern Hotel, New York City under an assumed name, where he has been living in a secluded manner since the night of his disappearance.

Daniel Drew, formerly one of the kings of Wall St., is bankrupt. His gifts to Wesleyan University and the Drew Theological Seminary seem to have vanished with his fortune, leaving those institutions in precarious condition.

Frederick Douglass is to deliver an address at the unveiling of a monument of Abraham Lincoln on the 14th of next April in Lincoln Park, Washington. The monument has been erected from funds contributed by freedmen.

The Albany and People's Gaslight Companies of Albany, have made another reduction of twenty-five cents per 1,000 feet in the price of gas, making fifty cents of reduction since the 1st of December. The second reduction went into effect on the 1st inst.

J. H. Stanley, the town clerk of Leroy, N. Y., has enjoyed a remarkable tenure of office. At an election he was unanimously re-elected for his fiftieth consecutive term.

St. Patrick's Day was observed in Providence, R. I., by religious exercises in all the Catholic churches, a parade of the Ancient Order of Hibernians, which was reviewed by the Mayor, and by banquets, balls and entertainments in the evening. There were also public demonstrations in Woonsocket, Pawtucket, Phœnix and Newport.

The towns of Lima, Springwater, Ossian, Sparta, West Sparta, and Groveland, in Livingston Co., N. Y., voted "No license" at the recent town meetings.

The Democratic Executive Committee met at Raleigh, N. C., March 15th, and appointed Raleigh as the place and the 14th of June as the time for holding the State Democratic Convention.

A large meeting of gentlemen representing various branches of the dry goods trade was held at Boston, March 15, and an association was formed for the protection and advancement of the interests of the trade to be called the "Boston Dry Goods Association."

Dr. James W. Willse, the superintendent of the State Asylum for Insane Criminals in Auburn, N. Y., died March 13th, at his home in that city.

The twenty-fourth annual commencement of the Women's Medical College of Pennsylvania was held in Philadelphia, March 6th. The degree of the College was conferred upon twelve ladies.

Messrs. Woods, Yeatman & Co., owners of the Cumberland Iron Works in Steward Co., Tenn., have suspended. Their liabilities are about $250,000, which will probably be covered by the assets. The largest portion of their creditors belong at Nashville, while others are in Louisville, Cincinnati and St. Louis.

The Onondaga County Milk Association has resolved to sell to the poor of Syracuse 100,000 quarts of milk at three cents per quart.

The farmers residing in the town of Granville, Washington Co., having a large supply of potatoes still on hand, are offering them for sale at 12 cents per bushel.

The Black Hills fever is commencing to rage in Rochester, and it is carefully fostered by the programmes, advertisements, bills, &c., of Western railroads.

The locomotive and eight cars of a freight train on the Atlantic and Pacific Railroad went through the bridge over the Merrimac River on March 15th, killing Christopher Lesson, engineer, badly bruising Harrison Preston, fireman, and destroying a good deal of property.

The election in New Hampshire has resulted in the re-election of Gov. P. C. Cheney, Rep., by three thousand majority, and large Republican majorities in both branches of the Legislature. A very large vote was polled and the entire Republican ticket elected.

FOREIGN NOTES.

THE British ship Eumenides, Capt. Beard, from Port Royal, S. C., Feb. 17 for Greenock, capsized on the 12th of March. The second mate and seven of the crew have arrived at Queenstown. The remainder of the crew and the captain, 13 in all, were drowned.

In the House of Commons, London, March 16, when motion was made to go into Committee on the Royal Titles bill, the Marquis of Hartington rose and moved in amendment that, while willing to consider a measure enabling the Queen to make an addition to her titles, the House considers it inexpedient to impair the dignity of the Crown by the assumption of the title of Empress. The debate lasted seven hours, and was excited and acrimonious. Sir William Harcourt and Messrs. Forster and Duff opposed the bill, and Mr. Roebuck and Lord Elcho supported it. Finally, the Marquis of Hartington's amendment was rejected and the motion for going into Committee on the bill was adopted by a vote of 305 Yeas, to 200 Nays.

The cremationists of Germany will hold an annual meeting in April, at Gotha, where the Government has officially sanctioned their mode of disposing of the dead and permitted its public use.

Upon the score of economy, the directors of the South Yorkshire coal mines have ordered that hereafter blasting must be discontinued when men are down in the pits, as the continued deaths by accidents render skilled labor very dear.

In the House of Commons at London, March 16, the Postmaster-General, Lord John Manners, stated that it was the intention of the Department after the present year to make arrangements for the conveyance of the mails to America similar to those adopted by the United States, viz.: to make no contract, but send the mails by vessels whose efficiency is proved, and pay according to weight.

In France the storm has been particularly severe, inundations being reported from all the rivers, causing a great deal of loss and suffering.

Queen Victoria will start out for her tour in Germany on the 28th inst. It will be a quiet family excursion, as she desires no public receptions, and will meet relatives by blood or marriage at every step.

The United States steamer Franklin, which sailed on March 14, from Southampton, Eng., for Cherbourg and Gibraltar, has been obliged to put into St. Helen's Roads, Isle of Wight, on account of the continuously unfavorable weather.

The London Times correspondent at Ragusa says a telegram from Cettinje states that the insurgents under Peko and Socica attacked the Turks March 6, at Muratovizza while returning from Goransko. The Turks were routed and pursued to Lipuik, losing about 800 men, and horses, ammunition, and cannon. The correspondent declares that the information comes from a trustworthy source.

THE SEASON, CROPS, PRICES, ETC.

Mt. Pleasant, Jeff. Co., O., March 15.—We have had a remarkably open winter; less snow than any season for 15 or 20 years. Very little cold weather, the mercury touching zero only once. Rain in abundance; mud *ad infinitum*, roads almost impassable. Stock has gone through the winter better than usual, owing to the abundance of rough feed in the country. Wheat looks better for the season than for several years past. Hay is worth $10@15; corn, 40c.; oats, 35c.; potatoes, 30@35c. Month hands command $12@17; work scarce. Hogs are selling at 5½c.; cattle, 4@4½c.; grass and other vegetation started. Considerable plowing already done. The season has been pretty good for maple molasses making, though the sugar trees have been destroyed to a great extent in these parts, but those remaining are mostly opened this spring. Farmers who are cursed with debt are having a hard struggle to keep their heads above the wave; unless times improve, a great many will have to sell out at a sacrifice soon, or else do worse.—B. C. C.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 18, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	68,542	Molasses	2,454
Whisky	2,339	Rice, bbls	967
Corn meal, bbls	703	Cut meats, pkgs	13,127
Corn meal, bags	1,590	Lard, pkgs	6,340
Wheat, bush	238,754	Tobacco, hhds	1,804
Corn, bush	34,928	do. cases	2,520
Oats, bush	218,101	Butter, pkgs	14,150
Rye, bush	300	Cheese, bxs	19,200
Malt, bush	70,515	Cotton, bales	17,000
Barley, bush	25,500	Rosin	2,850
Beans, bbls	11,848	Spts. turp., bbls	872
Grass seed, bags	9,364	Dried Fruits, pkgs	285
Beef, pkgs	2,638	Eggs, bbls	20,240
Wool, bales	859	Peanuts, bags	7,280
Hops, bales	2,708	Dressed Hogs	902
Pork, bbls	8,141	Leather, sides	94,527
Tallow	525	Sugar, hhds	585

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else.

BEANS AND PEAS.—Exports of beans past week, 2,411 bbls.; since Jan. 1st, 14,833 do.; same time last year, 5,250 do. Exports of peas past week, 9,046 bush.; since Jan. 1st, 20,883 do.; same time last year, 119,172. The few sales of marrows have given them a shade of firmness in holder's views. Mediums are dull and prices are weak. It is thought that the bulk of the interior reserve will soon be stored and better rates may rule. Still, warm weather does not increase trade in mediums, and we do not look for any sudden material advance. Pea beans and kidneys dull at quotations; Canadian peas quiet, but a little stronger. Other peas dull and weak. State marrowfats nominal at $2.

We quote: Beans, pea, new, prime, $1.30@1.65; other, $1.10@1.20; medium, new, prime, $1.15@1.20, good, 90c.@$1; very poor, 50@80c.; marrow, new, prime, $1.65@1.70; other, $1.40@1.50; white kidney, prime, $1.60@1.70; fair to good, $1.40@1.50; red kidney, new, prime, $1.35@1.40; fair to good, $1.0@1.20; California Lima, choice, $2.40@2.50. Peas, Canadian, bbls., new duty paid, $1.15@1.19; gulk, in bond, 90@$1; green new, ⅔ bush., $1.50@1.55; Southern B. E., ⅔ 2 bush. bag, $2.60; split peas, Canadian, free, ⅔ bbl., $5@6.

BEESWAX.—Choice lots are wanted at strong figures. Southern at 34c.; Western at 32½@33c. Exports since Jan. 1st, 27,347 lbs.; same time last year, 33,728 do.

BROOM CORN.—For prime stock there is a fair inquiry for choice lots; other grades dull.

We quote Brush, short green, 9@10c.; hurl, green, 8½@10c.; green, medium, 5@7c.; red and red-tipped, 3@4c.

BUTTER.—We are now on the last end of the State butter crop; and as the remnant is reduced to an inconsiderable quantity, the market indicates a strong closing up. Both sellers and owners are to be congratulated upon the way the heavy yield has been handled during the past season. The result ought to be instructive to producers showing, as it does, that they must depend upon the masses for the movement of supplies. The average low or under grade stock for the past make gives this point more prominence than would have otherwise been the case had the crop been one of higher condition. As it is, good prices have been obtained for the fine portions and fair rates for fair to poor lines. One of our recent paragraphs explained why stock should be marketed reasonably early in most instances, and we would now call attention to another point of interest to dairymen. It has been seen by the general run of the market that there has hardly been a week that offered the full complement of fine. Uncontrollable circumstances in the weather last packing season interfered with the operations of many who have a steady reputation for turning out choice marks. But, in many previous years there has not been a winter that has not shown room for a larger supply of fancy, or for that matter, strictly fine. Great stress is laid upon the fact that marketmen and ordinary grocers use the common or intermediate grades; while it is true that they undoubtedly work off the bulk of such lots, it may be remarked that nearly all of them have a class of custom which calls for extra quality, and is willing and able to pay top-going quotations. So don't be afraid that we can be overloaded with a prime article; prices are bound to balance according to the popular purse or exigencies of the times. Therefore, when stock is attractive, the owner has at least the benefit of an active trade that will not settle upon a low class of produce. The following revised table shows the advances that have occurred in State since our last. Western is bringing very satisfactory prices and sells readily. New butter is quotable in a small way as follows:

Pails, State, prime, 40c.; fair to good, 35@37c.; half-firkin tubs, prime, 38@40c.; fair to good, 33@36c.; pails, Western, creamery, prime, 40c.; fair to good, 35@37c.

We quote old:

State dairies entire, extra, 35@37c.; entire, good to prime, 32@34c.; fair to good, 30@32c.; firkins, selected fresh, 35@37c.; good to prime, 32@34c.; fair to good, 27@32c.; half-firkin tubs, selected, 40@42c.; good to prime, 36@38c.; fair to good, 32@36c.; poor to fair, 22@32c.; State, Welsh, tubs, fall made, 30@33c.; dairies, 33@34c.; good to prime, 29@31c.; fair to good, 26@28c.; poor to fair, 20@26c.; Pennsylvania, store packed, 18@23c.; Western, dairy tubs, selected, 30@31c.; good to prime, 28@30c.; tubs select-

ed fresh, 30@31c.; good to prime, fresh, 28@30c.; fair to good, fresh, 24@27c.; poor to fair, fresh, 17@24c.; Western, early packed, selected, 25@27c., good in lines, 23@24c.; fair in lines, 20@21c.; poor, 17@19c. Roll butter, Mich. & N. Ills., fancy, 29@30c.; good to prime, 27@28c.; fair to good, 25@27c.; poor to fair, 20@24c.

CHEESE.—There is more doing on export account, chiefly in good medium grades, which are available in instances at lower figures. Fine State is held at steady, but little wanted. The home trade is light.

New State factory, fancy, 14@ — c.; fine, 13½c.; do. good to prime, 12@13c.; fair to good, 10@12c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12½@13c.; good to prime, 11@12c.; fair to good, 10@11c. Western factory, cheddar, fine, 12½@13½c.; good to prime, 11@12c.; flat fair, 8@10½c.; poor to fair, 7@8c.

COTTON.—Is unsettled and weak with a light export movement. March, 12 31-32@13c.; April, 13 1-16c.; May, 13 11-32@13⅜c.; June, 13⅜@13 21-32c.; July, 13 27-32@13⅝c.; August, 13@14 1-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.		*Ala.*		*Orleans.*		*Texas*	
Ordinary	9	5-16	9	5-16	9	9-16	9	5-16
Strict ordinary	10	3-16	10	3-16	10	3-16	10	3-16
Good ordinary	10	13-16	10	13-16	10	15-16	10	15-16

Stained.

Good ordinary	9 7-16	Low middling	11 1-16
Strict ordinary	10 9-16	Middling	11 15-16

DRIED FRUITS.—There is more doing in a jobbing way in apples, but large parcels sell slowly, with prices barely steady. Peaches are still very dull. Blackberries weak and neglected.

Apples—State, sliced, 10@10½c.; quarters, 9c.; Western quarters at 8½@8¾c.; Southern sliced, 1875 crop, 10@10½c. for prime. Tennessee qrs., 8¾@8½c. Blackberries, new, 11 @ c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12@12½c. for halves, and 10@11c. for quarters. Plums, 20c. Raspberries, 27c. Cherries, 21@22c.

EGGS.—Thus far the Lenten season has not been fraught with much encouragement for egg dealers. It has been difficult most of the past week to hold prices at 16c. for best Western fresh. Anything off in quality through long storing has had no attention. Receipts are out of all character for the season or the extra wants of the season. We quote:

Jersey, single barrels, ₽ bbl., 16½@17½c.; State & Penn., 16@16½c.; Western, prime, 15½@16c.; do. fair marks, 15@15½c.; do. old stock, 12@14c.; Southern and Southwestern, 15@15½c.; Illinois, 10@12c.

ESSENTIAL OILS.—We quote:

"H. G." oil peppermint, $4, in glass; Hale & Parshall do., $4@4.20 do.; pure in tin, $3.50; sassafras, 55c.; wintergreen, $3.12; spearmint, $3.50; pennyroyal, $4.

FEATHERS.—Stock small, prices firm. Live Western geese 54@56c.; mixed, 35@45c. Common poultry feathers not wanted.

FLOUR.—There is an active export movement through the influences working on wheat, and prices are higher and strong.

Superfine State, $4.20@4.75; extra do., $4.90@5.60; superfine Western, $4.20@4.57; extra do., $4.90@5.75; No. 2, $3.20@4.00; extra round-hoop Ohio, $4.50@5.25; trade brands do., $5.30@7.25; white wheat extras, $5.80@7.00; St. Louis, $5.25@9.00; City Mills extra, $5.00@6.50; Southern at $4.10@4.65 for superfine; $4.80@6.15 for poor to choice shipping extras; $6.25@8.75 for trade and family brands. Corn meal, lower and hard to sell; Western yellow, $2.60@3.20; Jersey & Penn., $2.70@3.25. Brandywine, $3.25@3.35.

FRESH FRUITS.—Exports of apples past week, 100 bbls. Since Jan. 1st, 3,051 do.; same time last year, 10,516 do. Choice red and other prime winter apples are diminishing. Russets begin to fill up the gap and open with very good prices. Stock is keeping well except some of the tender sweet sorts. These, however have only a side interest in the N. Y. apple market. Baldwins are quoted at $4.25, wholesale; Spitzenburgs, $4.75@5.00 do.; Greenings, $3.75@4.00 do.; Russets Roxbury, $3.50@4.00. Cranberries are firm for the small remnant. Somebody has the art of keeping catawba grapes in fine order. We seldom see them actually quoted at 9c. at this late date. Florida oranges are active when prime. A good many of poor grade are here. Prime loaf bbl. crates bring $4.00@5.00 each. Strawberries from Charleston and Florida, range at $1.50@2.50 per quart. Pretty good orders on packages are being filled for Florida. Hot house strawberries are quoted at $3.00@4.00 per quart. Peanuts are doing well. Stock of fine mainly Virginia,

Apples.—Spitzenbergs and Baldwins, fine, $4@4.50; Greenings, —@—; mixed, good, $3.50@3.75; other $2.50@3.25. Oranges, Florida, per crate, $6.00@8.00. Grapes, Catawba, good to prime, per lb., 6@8c. Cranberries—Jersey, choice, bush. crates, full measure, $4.25@4.50; good to prime, $4@4.25; "pony" crates, $3.50@4.00; choice bbls., $13@14. Nuts—Peanuts, Virginia, per bush., 1.55@1.70; Wilmington, $1.80@2.00, do. Tennessee, 95@$1.15. Hickory nuts, shellbark, $1 do.

GINSENG.—We quote Southern at $1.15@1.25; North and Western, $1.10@1.15.

GRAIN.—For wheat, with reports from the other side of unfavorable weather and spring farm work delayed, leading to higher markets, there has been an active export trade here and prices decidedly higher. Latest sales at $1.20 for soft ungraded Minnesota spring; $1.20 for Nos. 2 and 3 mixed Milwaukee spring, $1.17 for No. 3 Milwaukee spring in fresh receipt; $1.15 for No. 3 Chicago spring in store; $1.30@1.33 for No. 1 Minnesota spring; $1.30 for choice old No. 2 Milwaukee; $1.27@1.25 for do. do., full inspection; $1.26@1.25 for do. do., fresh receipt; $1.23@1.23½ for No. 2 Chicago spring, fresh receipt; $1.23 for prime old do. do. in store; $1.15 for mixed Iowa spring; $1.07@1.15 for ungraded do.; 85c. for very inferior do.; $1.30 for fair amber Western; $1.35 for good white Canada, in bond, afloat; $1.31 for Canada club, in bond, afloat. Rye held firmly at 90c. for prime State, and 80@85c. for Western. Barley strong, with two-rowed State at 77½@85c.; No. 2 Bay, $1.07@1.12½; No. 2 Canada, $1@1.10. Barley malt difficult to sell, and quoted at $1.15@1.35 for Canada; 90c.@$1.05 for two-rowed State. Corn is lower, but closed strong, with a good export trade; mixed Western, 62@62½c.; yellow do., 62@62½c.; yellow Jersey, 59@61c.; yellow Southern, 62@63½c. Oats are higher and strong; sales at 41@41½c. for mixed Western; 41@43c. for mixed State.

HAY AND STRAW.—With the opening of river navigation and the larger supplies in consequence, prices are unsettled and easier.

Bale hay is quoted:—Shipping, 75@80c.; retail qualities, 95c.@1.05; clover, 60@70c.; salt, 60@70c. Straw is quoted at $1.05@1.15 for long rye; 75@80c. for short rye; 60@65c. for oat.

Exports past week, 511 bales; since Jan. 1st, 6,130 bales; same time last year, 7,576.

HIGHWINES.—Selling at $1.10.

HONEY.—Remains in its old state of seeming immobility. Prices are very low, and it is doubtful if even cheaper rates would start it at this advanced season.

We quote:—White clover comb, 18@22c.; buckwheat and other dark comb, 10@12c.; strained, 10@12c.

HOPS.—There is a fair trade on export account, with prices unchanged. The receipts this week have been much larger than expected and have included more choice stock than had been supposed was back in the interior; this has led to more cautious dealings.

N. Y. State, 13@19c.; Eastern, 11@17c.; Wisconsins, 11@17c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias, 17@20c.

MAPLE SUGAR.—As before, the sale is confined to a few buyers, who must have the novelties of a season. The World very appropriately remarks that: "This year, above all others, ought to be a profitable one for the maple groves, as the Centennial visitors will be likely to give attention to this delicious special forest product of ours."

New prime sugar ranges at 14@16c.; fair to good, 12@13c.; old, 8@12c.

POULTRY AND GAME.—As before, fresh-dressed poultry is in light supply. Lots of frozen begin to appear; quoted at 17@18c. for turkeys and 14@15c. for chickens. Philadelphia and South Jersey dry-picked poultry is quoted at 21@23c. for chickens (the outside rate for lots of all choice chickens), 17@22c. for turkeys (the inside rate for heavy), 30c. for large capons and 26c. for small capons and slips.

Chickens, Bucks Co., good to prime, 19@20c.; Jersey, good to prime, 17@19c.; State, good to prime, 16@18c.; Western, good to prime, 15@17c.; fair to good, 12@15c.; poor, 8@10c. Turkeys, Jersey, good to prime, 17@20c.; State, good to prime, 17@19c.; Western, good to prime, 16@19c.; inferior, 8@12c. Ducks, Jersey, good to prime, 20@22c.; State, good to prime, 19@21c.; Western, good to prime, 18@20c.; fair to good, 16@18c.; poor, 10@13c. Geese, Jersey, prime, 12@15c.; State, good to prime, 12@14c.; Western, good to prime, 11@13c.; do., poor to fair, 8@11c.

Live poultry is fairly steady, there being some room for both turkeys and chickens, owing to the light supply of dressed.

Turkeys, Jersey, ₽ lb., 15@16c.; do. Western, 14@15c.; Geese, Jersey, ₽ pair, $2@2.50; do. Western, $1@1.50; ducks, Western, ₽ lb., 65@75c.; ducks, Jersey, ₽ pair, $87@1.25; fowls and chickens, State and Jersey, ₽ lb., 15@16c.; do. Western, 13@14c.; roosters, 8@10c.

Wild ducks are in poor order. Wild pigeons are in fair supply. We quote $1.6@1.25 for Southern Canvasback; 45@60c. for Mallard; 60@70c. for Western Redhead and 30@40c. for common yer pair; wild pigeons, feathered, ₽ doz., $2; English snipe, $4@4.25; plover, $3@3.25; hares, ₽ pair, 20@25c.; rabbits, 30@40c.

PROVISIONS.—Exporters have been operating freely, and prices generally are higher and strong. Mess pork is quoted $22.90@23 for spot lots, $22.95 for March, $22.95 for April, $23.15 for May, $23.35 for June. Extra prime, $19, and prime mess $21@21.50. Boxed, dry salted shoulders, 9c. Tierced pickled hams, 13@14c. Bacon at 12½c. for Western long clear, 13c. for city do., 12½c. for Western long and short clear, together, 13½c. for short clear. Lard—Western steam at 13-75c. for spot lots and March, 13-75c. for April, 13-85c. for May, 14-07½c. for June, and 14-15c. for July. Stearine at 14½@11½c. for choice. Tallow at 9c. for prime. Beef hams at $24@26. Beef—New extra mess at $13.50; do. plain mess, $12.50; new tierced at $25 for prime mess, and $25 for India mess. City extra India mess, $32@32.50.

SEED.—For clover there is an excited and much higher market, with small receipts and an active home trade demand; prime and choice State, 16½@17c.; Canada sold at 14½c., in bond.

TOBACCO.—There are liberal arrivals of Western leaf, but prices are now so low that holders are disposed to store supplies in preference to pressing business. Export demand moderate. Seedleaf is hard to sell, but without change in price.

VEGETABLES.—Exports of potatoes past week, 5,265 bbls.; since Jan. 1st, 55,389 do.; same time last year, 26,147 do. A further reduction in price for potatoes shows the further depressed condition of the market. Exports of onions since Jan. 1st, 4,000 bbls.; same time last year, 1,148 do. White onions are higher. Southern green peas have a wide range, owing to condition; quoted $1@1 per bush.

Early Rose, bulk, ₽ bbl., 87c.@$1.25; Peach Blows, $1.12@1.37; Prince Alberts, 87c.@$1.12; common, 50@80c. Sweet potatoes, $2.50@3.00. Cabbages, ₽ 100, $4@6; red, $6@10. Squash, Marrow, bbl., 75c.@$1; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@3.50. Russia Turnips, ₽ bbl., 75c.; white, 60c. Carrots, $1.00. Southern spinach, ₽ bbl., $2.50@2.75. Kale, $1@1.25.

WOOL.—There is rather a weak market generally, with demand entirely for small lots, as needed to replenish assortments. Sales of No. 1 Ohio fleeces at 48c.; medium fleeces, 48c.; Oregon, 33c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., March 18, 1876.

THE cheese market this week showed sales of a few farm dairies at 10@12c., and one factory—the Brockett & Feeter—110 boxes at 12½c.

About 75 packages of butter were offered and sold, the best grades of which—made from new milk—brought 25@31c. Common grades sold at 25@28c. Many dairymen who have been holding their butter for some weeks back closed out their stock.

We have advices from Europe to the fourth week of February. Our London correspondent says:

Fine English cheese scarce and dearer, as also Dutch. American, fine, in small compass; a special dairy sold at 68s., to arrive; more doing in low at 30@45s. The prices are as follows:

American extra, 65@66s.; fine, 63@64s.; good, 56@60s.; common, 36@46s. English cheddar brings 80@96s.; Wiltshire double, 56@80s.; Cheshire medium, 56@66s.; fine, 76@86s.; Scotch, 60@76s.

Fine butter is scarce. Good intermediate Continental and American sell well, as also the intermediates.

Jersey sells for 100@148s.; Dorsets, 174s.; Danish and Swedish, 100@174s.; Friesland, 150s.; Normandy extra, 140@164s.; American and Canadian, 90@126s. ₽ cwt.

LIVE STOCK MARKETS.

" last week	7,907	60	563	20,502	27,328

BEEVES.—Trade on Monday last opened slow at a reduction of ½c. ₽ lb. on the opening rates of the previous week. Prices ranged from 8¾@13½c. ₽ lb.; weights, 5¾@10 cwt. The quality of the herds above quoted was generally coarse, ranging from poor to good, with only a few choice. On Wednesday trade was fair at 9@12¾c. ₽ lb.; 6@8¾ cwt. Thursday, no change in the general tone of the market; prices were 8@11c. ₽ lb.; 5¾@8¾ cwt. The markets closed weak on Friday at 9@11½c. ₽ lb.; 5¾@8¾c. From 65@68 lbs. net, were allowed to the cwt. Spanish herds, corn-fed, sold at 9¾@9¾c. ₽ lb. Texan oxen at 8@9¾c. ₽ lb.; State do., 8@12¾c.; Western do., 9@10¾c. Native steers sold at 8@12¾c. ₽ lb.; grade do., 12¾@13¾c. Bulls, live weight, at 4@4¾c. ₽ lb. Mixed herds, 9@11¾c. ₽ lb. Dry cows, $45 ₽ head. Bulls, 4¾c. ₽ lb., gross weight.

COMPARATIVE RATES.

Quality.	This week. Cents.		Last week. Cents.	
Good	12	@13¾	12	@13
Fair	11	@11¾	11	@11¾
Poor	10	@10¾	10	@10¾
Poorest	8	@ 9¾	8	@ 9¾
Gen. selling rates	9¾	@10¾	9¾	@10¾

MILCH COWS.—The quality of the cows on sale during the past week was not good enough to meet the demand, and in consequence sales were slow and low. Nine cows sold at $37@55 ₽ head; 4 do. at $50@60; 11 do. at $65@79.50; 3 do. at $102; 4 do. at $55, calves always included; 6 springers were sold at $65@72 ₽ head.

VEALS AND CALVES.—Smooth quality veals scarce and in fair demand at 9@11c. ₽ lb. Coarse quality meal-fed calves were also fair of sale at 7@8¾c. ₽ lb. On a very light run of grass calves trade was slow, those to hand being generally held. State veals sold at 9¾@10½c. ₽ lb.; Pennsylvania do., 9@11c.; Jersey do., 10@10¾c. State calves, 8@8¾c. ₽ lb.; Western do., 7@8c.

SHEEP AND LAMBS.—On a light run trade opened slow on Monday last and the markets closed weak, with several flocks unsold; quality was generally fair, with a choice top; prices ranged from 6¾@8¾c. ₽ lb. for sheep. Lambs not quoted. Trade slow on Wednesday; sheep sold at 6¾@7¾c. ₽ lb. Thursday, sheep sold at 6¾@7¾c. On Friday the markets closed dull; sheep sold at 6¾@7¾c.; lambs, 7¾c.; spring do., 11c.; Illinois sheep sold at 6@7¾. Kentucky do., 7¾c.; Ohio do., 6@8¾c.; Virginia do., 6¾c.; State do., 5¾@7¾c.; Missouri do., 6@6¾c.

HOGS.—There have been no live hogs on sale during the past week, up to Thursday noon; city dressed slow at 10¾@10¾c. ₽ lb.; Western do., 10@10¾c.; these were the opening rates. Trade closed dull, with city dressed at 10¾@11¾c. ₽ lb., and 2 car loads of Ohio hogs, live weight, sold at 8¾c.

HORSE MARKET.—City trade small but fair in sound, fair quality horses. Twenty-one roadsters, with moderate trotting action, sold at $200@425 ₽ head; 7 trotters sold at $500@975 ₽ head; 3 pairs of choice quality heavy draft horses sold at an average of $300 ₽ pair; 11 coarse quality do. sold at $200@350 ₽ pair; 52 poor quality light harness horses sold at $25@75 ₽ head. 13 ordinary quality do. sold at $95@135 ₽ head. Thirty-one horses arrived per Erie Railway via Oak Cliff Station.

QUINN, Practical Horticulturist, (Author of "Pear Culture for Profit,") and should be owned and studied by every one interested in Gardening. It is an able, practical, profusely illustrated work of 268 12mo. pages. Sent, post-paid, for $1.50. Address

D. D. T. MOORE, Publisher,
78 Duane St., New York.

WILLARD'S PRACTICAL BUTTER BOOK costs but $1, and is the standard. Order it. RURAL PUBLISHING CO., 78 Duane St., N. Y

"GENERAL FAVORITE" No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

PERSONAL ITEMS.

RICHARD GRANT WHITE is well again.

DR. LEONARD BACON is seventy-four years old.

CLARA MORRIS will go to Florida for her health.

STEWART L. WOODFORD will stump Connecticut.

QUEEN VICTORIA wears black, with a white tulle veil.

EX-GOV. JOEL PARKER of New Jersey, is in Philadelphia.

LOTTA now owns a villa at Oakland, opposite San Francisco.

THE membership of Mr. Spurgeon's church numbers 4,813 persons.

THE Prince of Wales has left India. He will call at Malta and Lisbon.

DR. HUGGINS has been elected President of the Royal Astronomical Society.

MRS. NELLIE GRANT-SARTORIS does not expect to visit her parents before autumn.

MISS ROSA BONHEUR, the painter, is the guest of Lord Cochrane at Dumfries, Scotland.

ROBERT LAIRD COLLIER has in press in London a book called the Essence of Christianity.

THE Empress of Austria is about to visit her sister, the Duchess d'Alencon, in England.

M'LLE DE LA RAME, better known as "Ouida," has been married to a Russian gentleman.

AT Professor Tyndall's wedding were Thomas Carlyle, Professor Huxley and Dr. Hooker.

THE death of Mrs. A. H. Bowman, Mrs. Belknap's sister, is announced from Louisville.

THREE sermons were preached in Boston in honor of the memory of Charlotte Cushman.

W. F. STOREY denies that Tilden, Wood and Randall have tried to buy the Chicago Times.

MARTHA MCQUIRK died in St. Joseph's Home for the Aged in N. Y. City, March 13, at the age of 106.

THE Right Hon. W. E. Childers has returned to Ottawa, and is the guest of the Governor-General.

PROFESSOR G. C. FOSTER, F. R. S., has been elected President of the Physical Society of London.

EX-GOV. WALKER of Virginia, has been invited to deliver the Fourth of July oration at Waverley, N. Y.

JESSE WELLS, a Shaker of the Watervliet Community, aged 98 years, died while on his knees in prayer.

CHAS. P. SCHNAUFFER, four times married and a Brooklyn grocer, is suspected of having murdered his wife.

ALEXANDRE DUMAS favors the making of a new French flag out of all the rival ones, with the tricolor as a base.

BESSIE TURNER'S brother, William, does not charge any admission fee at his lecture, but takes up a collection.

THE Grand Cordon of the Order of the Redeemer has been bestowed upon King Alfonzo by the King of Greece.

PROF. TARGIONI has been appointed by the Italian Government director of an entomological station at Florence.

THE Queen of Holland, who has considerable literary ability, is writing a book on the beauties of the coasts of Southern France.

SPEAKER KERR is again extremely low in health, and it does not seem possible that he will long endure without another respite from labor.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

Dairy Salt.

THE AMERICAN DAIRY SALT COMPANY

J. W. BARKER, Pres't and Sec'y. THOMAS MOLLOY, Treasurer.

General Office, No. 1 Clinton Block, Syracuse, N. Y.

Sole Manufacturers of the Celebrated Onondaga Factory Filled

DAIRY AND TABLE SALT.

Respectfully call the attention of Dairymen and others to the quality of Salt now being manufactured by them.

Having for many years past been engaged in perfecting the various processes for the manufacture of this salt, and by adopting the best modes and machinery for the purpose, they feel warranted in saying to the consumer that the article now produced is superior to any other, either of foreign or domestic production. The following is an analysis of our salt and the Ashton, made in April, 1875, by Messrs. Waltz and Stillman, Chemists, of New York, under the direction of a Committee of the Butter and Cheese Exchange of New York, the samples being selected by the Committee from lots found on sale in market:

	Ashton.	Onondaga.
Water	0.7880	0.6280
Insoluble Matter	0.0564	0.0364
Sulphate of Lime	1.2272	0.7217
Sulphate of Magnesia	0.0769	.....
Chloride of Calcium	.....	0.0473
Chloride of Magnesium	0.0591	0.0346
Chloride of Sodium	97.7598	98.5243
	99.9674	99.9822

Circulars in regard to the various other tests made with this salt in comparison with the best foreign article, also certificates from a large number of the best dairies in the State as to its quality, may be had on application to J. W. BARKER, Secretary, Syracuse, N. Y., to whom orders for salt may also be addressed. It is also for sale by the Agents of the Company in principal Western Lake Ports; by ST. JOHN & AVERY, 101 and 103 Broad St., New York; REBRIGHT GEER, 109 Pier, Albany, N. Y.; E. W. PECK & CO., Burlington, Vt., and by dealers generally throughout the State of New York.

Inquire for ONONDAGA FACTORY FILLED SALT.

NEWS CONDENSER.

— Rain is spoiling California crops.

— Smallpox is raging in New Hamburg, N. Y.

— A powerful revival is in progress at Newburg, N. Y.

— A Jackson (Tenn.) mother is eleven and a-half years old.

— Good Templarism is all the rage this season in Kentucky.

— An Irishman supplies Chicago with most of its lager beer.

— Corn, as a crop, has greatly supplanted the grape in the Madeiras.

London pays nearly one-third of the whole income tax of England.

— Rich deposits of tellurium have been found near Colorado Springs, Col.

— The town of Granville, Washington Co., N. Y., has voted against license.

— Connecticut has 3,196 liquor dealers, and their traffic amounts to $15,000,000 a year.

In Rockland, Me., a cornet band composed entirely of women, is being organized.

— This year, for the first time, all Russian theaters will be kept open during Lent.

— The great Calvert sugar refinery of Baltimore is to be re-established with large capital.

— Paris has over 2,000 clairvoyants, 30 of whom are said to make $10,000 each per annum.

An Oregon farmer recently plowed up an Indian skeleton, together with 300 $50 gold slugs.

— A society has been organized in Fisk University, Nashville, for the evangelization of Africa.

— The expenses of the Five Points House of Industry (N. Y. City) last year, were about $32,000.

— The population of Paris in 1874 was 1,851,792. On the first of January, 1876, it was only 1,799,250.

— Linta Hose Co. No. 3 and Fountain Hose No. 4 of Binghamton, N. Y., will visit the Centennial.

— Gold Hill, Nevada, mourns for its pioneer cat, which recently died at the ripe age of 18 years and 6 months.

— Upward of 500,000 new grape-vines, mostly of the raisin variety, will be planted in Fresno Co., Cal., this spring.

— The entire front building of the Rochester Brewing Co. was destroyed by fire March 11. Loss estimated at $30,000.

— The licenses to shoot game in Scotland amount to $3,000,000 annually—much more than all the game is worth.

— Since January, 1858, when the British divorce act went into operation, the number of petitions has averaged 338 per year.

— In England the country bred boys average 1¼ inches more in hight and seven pounds more in weight than the city boys.

— On March 11, 300 laborers on the New York, Bay Ridge and Jamaica RR., struck for $1.50 a day. They were receiving $1.

On account of the hard times the seniors of the Wesleyan Female College at Macon, Ga., have resolved to graduate in calico dresses.

— The new city and county hall at Buffalo, was formally opened March 13th, with speeches by a number of prominent legal gentlemen.

The troops of Fort Osborne, Ont., have been out twice for drill upon snow shoes and have attained considerable efficiency thereon.

— Cooper's novels are having a great run in Russia. Translated into that language, 8,000 copies of the leading stories were sold in a year.

— The Argentine Republic exports wool, mostly to Havre and Antwerp, to the amount of 250,000,000 pounds a year, and owns 80,000,000 sheep.

— The Women's Mission Societies of the United States have contributed about $270,000 during the past year, most of which went to foreign missions.

Thus far this season 43,470 bales of cotton have been handled at Vicksburg. The entire business of last season amounted to only 35,000 bales.

ESTEY'S COTTAGE ORGANS are the best.

Wit and Humor.

SPARKS AND SPLINTERS.

A CRYSTAL ghost—A glass shade.

FAST horses—Those that are safely secured.

IN these days no lady appears perfectly unruffled.

WHAT do cats have which no other animal has? Kittens.

WHAT is the latest thing in dresses—Night dresses.

WHEN is love deformed? When it is all on one side.

WHEN is a boat like a pile of snow? When it is adrift.

WHEN are eyes not eyes? When the wind makes them water.

WHY is matrimony like a landed estate? Because it is a proper-tie.

CAN a curl over the forehead be called "Locke on the Understanding?"

IRON is a good tonic for debilitated young ladies, but ironing is better.

THEORY may be all very well, but young doctors and lawyers prefer practice.

"WHAT did you give for that horse, neighbor?" "My note." "Well, that *was* cheap."

MAN is an animal that bargains. No other animal does. No dogs exchange bones.

WHY is a man's life safest before he has had dinner? Because he can't di-gest then.

WHAT is the greatest affair of the heart known to science?—The circulation of the blood.

THE lady whose blood curdled in her veins has ever since been very sour in her disposition.

"THE only way to look at a lady's faults" exclaimed a super-gallant, "is to shut your eyes."

A CANDID old bachelor says:—"After all, a woman's heart is the sweetest in the world; it's a perfect honeycomb—full of sells."

WHY should soldiers be more tired on the 1st of April than on any other day in the year. Because they have just had a March of 31 days.

A MINNESOTA girl is named Happiness Quinn, and half the young men in the neighborhood wear black eyes for indulging in certain rights, among which are life, liberty, and the pursuit of Happiness."

IF there is anything in the world calculated to make a man forget he's been to hear Moody and Sankey on the previous evening, it is to bounce cheerily out of bed in the morning and light on the business end of a tack.

AFTER the ceremony the other evening in Seaford, Md., the happy groom handed the minister a twenty-five cent shinplasterer, saying, "I reckon twenty cents are about the right thing, ain't it?" and then waited for his nickel.

A GOOSE that sees another drink will do the same, though he is not thirsty. The custom of drinking for company, when drinking is dispensable and prejudicial, seems to be a case of the same kind, and to put a man, feathers only excepted, upon a footing with a goose.

A VIVID FIGURE.—Joaquin Milller, in describing how he fell in love with a girl at a railroad accident, makes a strange dramatic point where he says:

"I see her before me lie senseless and pale.
With her bustle ripped up on the ravenous rail."

ROGER M. SHERMAN was arguing a case, and made a point which the judge did not see. "Mr. Sherman," said he, "I would thank you to state, the point so that I can understand you." Bowing politely, Sherman replied, in his blandest manner:—"Your honor is not probably aware of the task you are imposing upon me."

IT takes the Chinese to bring out the inherent beauties of that favorite ballad, "How doth the little busy bee:"

How belly small chin-chin sting bug
Im-im-plove ebly sixty minit all a time,
Go, pickee up sting bug juice all day,
All kin' places 'loun flowels just got busted.

"I HAVE my own 'pinion on zis question," remarked a seedy looking individual on State street last evening. "What is your opinion?" asked a gentleman standing near by. "My 'pinion, zur," replied the man, "is zat every feller's got his own right (hic) to go on a tariff 'e wants to." No one ventured to dispute his views.—[*Chicago Journal.*

"How much is my bill?" inquired a sad-eyed youth in a Chicago confectionary store the other day. The proprietor looked over his books a minute and then replied—"Sixteen dollars and fifteen cents." As the young man drew forth his wallet to meet the account he sighed deeply and said, "I tell you this is tough!" "How so?" asked the confectioner. "Oh, she's gone back on me." "Who?" "Oh, she—the girl that eat all the candy," continued the unhappy youth, "and I tell you it's hard to pay for so much sweetness after its gone and soured on a fellow." The candy man acknowledged that it did seem kind of rough.

WILBOR'S COMPOUND OF
PURE COD LIVER OIL AND LIME.
Wilbor's Cod Liver Oil and Lime.—Persons who have been taking Cod Liver Oil will be pleased to learn that Dr. Wilbor has succeeded, from directions of several professional gentlemen, in combining the pure oil and lime in such a manner that it is pleasant to the taste, and its effects in lung complaints are truly wonderful. Very many persons whose cases were pronounced hopeless and who had taken the clear oil for a long time without marked effect, have been entirely cured by using this preparation. Be sure and get the genuine. Manufactured only by A. B. WILBOR, Chemist, Boston. Sold by all druggists.

THE JONES' SYSTEM.
DIRECT SALES TO THE USER.
ALL SALES ON TRIAL.
FREIGHTS PREPAID.
No risk to the purchaser, as no money is paid until you are satisfied. The Jones' system will bring your goods at lower prices. Will you try it or continue to sustain monopolies? For free Price List of Scales, address JONES of Binghamton, N. Y.

AGENTS WANTED for the BEST BIOGRAPHIES of MOODY AND SANKEY. This is the cheapest and best thing out. Don't sell any other till you see this. Large discounts to agents. Address MUTUAL PUBLISHING CO., Hartford, Conn.

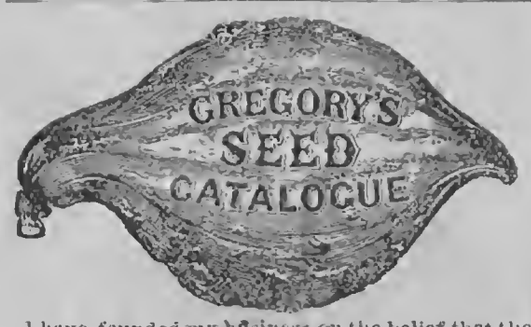
STEAM ENGINES FOR CHEESE FACTORIES, &c.
"The Iron Slave," First Premium N. Y. State Fair, 1875. Also many other great improvements in Cheese and Butter-making Apparatus. Send for Circular.
CHARLES MILLAR & SON, Utica, N. Y.



I have founded my business on the belief that the public are anxious to get their seed *directly from the grower*, and I therefore offer FREE to every man and woman in the United States who cultivates a farm, tills a vegetable garden, or plants a flower garden, my large, Illustrated Catalogue of Vegetable and Flower Seeds for 1876; it contains, in addition to the choicest kinds produced in Europe, *one hundred and fifty varieties of vegetable seed grown on my four seed farms.* Customers of last season need not write for it. As the original introducer of the Hubbard, Marblehead and Autumn Squashes, Phinney's Melon, the Marblehead Cabbages, and a score of other new vegetables, I solicit your patronage. All seed sold under three warrants. A hundred thousand Catalogues will be issued and sent out on the first of January.
JAMES J. H. GREGORY, Marblehead, Mass.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.
This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.
We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.
We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.
Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,
Most respectfully yours,

The Centennial.

THE CENTENNIAL BUILDINGS.—MACHINERY HALL.

To a great many visitors at the Centennial Exposition, Machinery Hall, of which we give a large illustration on this page, will be the most interesting portion of the Exhibition. The building consists of the Main Hall, 360 feet wide by 1,402 feet long, and an annex on the south side of 208 feet by 210 feet. The entire area covered by the Main Hall and annex is 558,440 square feet, or 12.82 acres. Including the upper floors, the building provides 14 acres of floor space.

The principal portion of the structure is one story in hight, showing the main cornice upon the outside at 40 feet from the ground, the interior hight to the top of the elevators in the avenues being 70 feet, and in the aisles 40 feet. To break the long lines upon the exterior, projections have been introduced upon the four sides, and the main entrances finished with facades, extending to 78 feet in hight. The east entrance will form the principal approach from street cars, from the Main Exhibition Building, and from the railroad depot. Along the south side will be placed the boiler houses, and such other buildings for special kinds of machinery as may be required. The west entrance affords the most direct communication with George's Hill, the point affording the best view of the entire Exhibition grounds.

WOMEN AT THE CENTENNIAL.

The women of New York propose to present a banner in the Women's Hall of the Centennial Exposition. At the close of the Exhibition the banner is to be transferred to Memorial Hall, to be preserved as a permanent memento of the great Centennial. The considerable sum which it is hoped will remain after the purchase of the banner, says the address to the ladies of the State by the Albany Central Committee of ladies, it is proposed to devote to an object which needs only to be named to commend itself to the mind and heart of every citizen of this republic.

Mount Vernon, so justly dear to us all, will soon be among the things that were, unless means be provided to arrest its decay and secure its preservation. "What then can we do more appropriate to this interesting period of our national life, or more worthy of the patriotism to which we can justly lay claim, than to take measures to preserve for those who are to come after us this precious relic of our early history? Influenced by these considerations, let us unite for the accomplishment of this grand object as becomes the women of the State of New York, and raise without delay the amount of money required to secure forever the preservation and good keeping of the home and grave of our immortal Washington."

Among the names of the Committee from the State outside of Albany appear the following:

Mrs. Bishop Huntington, Mrs. Horatio Seymour, Mrs. Rutger B. Miller.

OPENING CEREMONIES AT THE CENTENNIAL.

The programme for the opening ceremonies is in course of preparation. The grand platform will be erected midway between Memorial Hall and the northern entrance of the Main Exhibition Building. The proceedings will commence with a chorale by a large amateur choir, to be followed by prayer. There will be a cantata by an American composer, with a bass solo for a well-known Philadelphia singer, and a march composed for the occasion by Carl Wagner will be performed by the orchestra under the direction of Theodore Thomas. Mr. Wagner has been paid $500 for this march. Gen. Hawley, President of the Centennial Commission, will then make a brief address to the President of the United States, during which he will rehearse the prominent facts connected with the occasion and will request the President to formally open the Centennial buildings. After the President has made a reply to Gen. Hawley, they will descend the platform together, followed by the guests, and will enter the Main Building. They will then pass half-way down to the eastern end, recognizing France and the United States, who occupy that quarter, and then, retracing their steps, will traverse the nave to the western end, and emerging at that point, will cross the flowers and asphalt of the intervening square and enter Machinery Hall, where the official ceremonies will terminate. The cortege will then disband. Cannon and other firearms will be discharged the moment the President leaves the platform and all the chimes will commence ringing. All the steam whistles in Machinery Hall will be sounded and other noise-creating agencies will be put in operation at the same time. The cards of invitation have been handsomely designed by Dreka of Philadelphia, and will soon be completed.

A DOLL ONE HUNDRED YEARS OLD.

Most of the babies from one hundred years ago have passed away; but here we have the record of a doll, made as a temporary plaything for a child of 1774, which has endured the mutations of time and is carefully preserved as a relic. The doll was a New Year's gift, January 1, 1774, to little Sarah Horn, she being then but three years old, and living in the City of Philadelphia. Her father was a sergeant in the Pennsylvania Marines. The doll was the gift of an uncle, who was a wood-carver. It was more than a foot in length, and was a handsome piece of work, being carved from wood and representing a woman in the costume of the period, high-heeled slippers, high head-gear and all. When Philadelphia was evacuated Mr. Horn's family went to Bordentown, N. J., and were there when Mr. Borden's house was burned. At the battle of Monmouth, the family with others were hidden in a swamp near that battle ground. The doll shared the fate of the family, but was preserved in the swamp by its little owner with tender care. It has been held as an heirloom ever since. In 1858 it was brought from New Jersey by Mrs. South, a descendent of Sarah Horn, who married Elias Tice, and was given to a member of the family. During the Morgan raid it was in Batavia, and was again the object of tender solicitude on the part of its then young owner, who concealed it in her clothing to keep it from falling into the hands of the enemy. The doll is now in the possession of Temperance Tice, whose home is in Indianapolis. It deserves a place in its early home — Philadelphia — during this Centennial year.

NOTES ABOUT THE CENTENNIAL.

Massachusetts still wants additional space for its educational exhibit.

Eleven more buildings for the use of States, associations, &c., are to be erected immediately.

The French goods for the Exhibition will be sent to Philadelphia direct in four large ocean steamers.

A flower bed, 40 feet in diameter, will load the air with perfume in the vicinity of the Horticultural building.

Farm Economy.

USE AND BENEFITS OF PLASTER.

From a very able and interesting essay on this knotty subject, by Prof. G. C. Caldwell of Cornell University, in the Tribune, we copy the fellowing:

Next to the use of plaster on clover, its application to young corn is perhaps the most common practice. About a tablespoonful is given to each hill by some farmers just as the corn appears above the ground, by others not till it is two or three inches high, while others still apply it before the corn has come up at all. The general testimony of farmers who use plaster in this way is very emphatic in its favor. Some who have left rows of corn unplastered by the side of others that were plastered as usual assert that the difference in favor of the plastered rows was unquestionable.

As to the manner in which plaster acts when applied to the soil, I shall have to confess at the outset that the mode of its action has not yet been satisfactorily explained. There are many ways in which it may act, but it cannot be proved positively that it does act in any one of these ways alone in any given case. It may serve to feed the plant with lime and sulphuric acid; but there is generally a sufficient supply of both of these elements of plant food in the soil, and, moreover, the crops most benefited by plaster are not those that make the heaviest demand on the soil for lime and sulphuric acid. It may serve to fix atmospheric combined nitrogen, and bring it within the reach of the plant, but the quantity of plaster that remains on or near the surface of the soil, where it would be in a position to act in this way, is too small for the accomplishment of this work to any such degree as to make it of much service to the plant. Furthermore, the clover plant, which is most benefited by an application of plaster, is remarkably indifferent as regards the supply of combined nitrogen in the soil, so that the fixation of ammonia there would be of no special service to it. It has been found that plaster in the soil may increase the solubility of potash, a very important element of plant-food that is present there to a large extent in forms with difficulty soluble, and therefore not readily available to the plant; but, if this be the only explanation of its action, that plaster helps to bring a greater supply of potash within the reach of the plant, then application of ashes should produce the same effect as one of plaster. This has not been found to be the case, at least with clover. The difficulty is, however, in a measure removed by another effect produced by plaster; not only does it make the potash in the soil more soluble, but it also appears to assist the plant in some way to take up an additional quantity of the potash which it has first brought within easier reach. The plaster not only helps to cook the dinner, but also to get it eaten. If two plants are made to grow in solutions containing all the needed elements of their food, including potash, and one of these solutions contains sulphate of lime and the other does not, a much larger quantity of potash will be taken up by the plant that is growing in the solution containing plaster than by the other. Plaster also helps to bring other elements of plant-food, such as phosphoric acid, ammonia, and magnesia into solution, so that it may give aid to the plant in obtaining its supply of other food besides potash.

As to the very common impression that plaster draws water, it must be said in truth that while it appears to be impossible that this substance should exert any action of this kind, yet such a wide-spread opinion on the part of those who have used plaster is not to be removed by simply laughing at it. I have had the account from a gentleman, who is one of the most trustworthy contributors to this department of the Tribune, that as he has walked in the morning across a pasture that was plastered in strips his boots would be wet with dew only while crossing the plastered strips, and this was observed, too, long after the plaster was applied. I find it hard to believe this story, and yet I cannot disbelieve the man. There is a mode of action of plaster on vegetation that is somewhat akin to that of drawing moisture. Many substances, when taken into the sap at the roots, may serve to make the same quantity of water move more slowly through the plant from the roots to the leaves, where it escapes into the atmosphere by evaporation. This upward movement of water and its evaporation from the foliage is hindered to a greater extent by plaster than by any other substance that ordinarily enters into the sap. Thus it appears to be a most efficient agent for hindering the waste of water, so to speak, and making it last longer. In this way it may produce practically the same effect as that of a body which would actually attract moisture to vegetation or to the soil. I have thus passed in review very briefly the several modes of action of plaster by which it may possibly serve to increase the growth of vegetation, but I cannot designate any one of them as the one way in which it does act, either in any given case or in all cases. If superphosphate produces a great increase of the crop to which it is applied, we know that the effect is produced by the phosphoric acid or the nitrogen of the fertilizer. If Chili saltpeter is used with good effect we know positively that the result was due to the nitrogen of the nitric acid in the saltpeter; but it is quite otherwise with plaster, and till favored with more light I cannot do better than to allow the possibility of its action by all the modes which I have noticed, not excepting even the possibility that it draws moisture, or rather saves water.

EXPERIMENTS WITH SUPERPHOSPHATE.

Mr. E. R. Towle of West Berkshire, Vt., relates in the Boston Cultivator some very interesting and successful experiments with superphosphate made by himself and his neighbors. He says: I use it on potatoes, soil a gravelly loam, previously in grass, turned over last spring, and no manure used, only superphosphate in the hill. The yield was increased about 50 per cent. above that where no fertilizer was used, and the crop was of good quality and quite free from the depredations of the white grub, that made sad havoc with many fields in this vicinity.

A farmer in another town obtained the following results with potatoes: Soil, green sward and gravelly loam. Plot with no manure yielded at the rate of 173 bushels to the acre, quality inferior. Plot with horse manure harrowed in, 240 bushels, and another plot with manure and a tablespoonful of superphosphate in the hill, at the rate of 300 lbs. per acre, 360 bushels to the acre, the tubers being of uniform size and excellent quality. The last plot gave an increase of 120 bushels per acre over that treated with manure, and 187 above that with the fertilizer. One hundred and twenty bushels at 30c. a bushel would be $36, minus $10.25 for superphosphate, leaves $25.75 as profit above cost of fertilizer.

Last year the corn crop was very poor, owing to the backwardness of the season, and although a fair growth was obtained the corn did not ripen, and in consequence some was not husked, and much that was husked has since hurt in the crib. The farmer alluded to found the superphosphate to give as good a yield as where hog manure was used in the hill, and also that it matured earlier. Notwithstanding the cold and wet season another farmer in a town adjoining raised as sound corn with this fertilizer as he had ever done before with manure, and both were particularly pleased with its effects in the garden.

A friend in my own town planted one-half acre to corn with no other fertilizer but a large spoonful of superphosphate in the hill. The ground until the year previous had been in pasture, and had become thoroughly overgrown with brakes. It was first plowed and sown with buckwheat, which rotted the turf, but no manure was applied. The growth of corn was very large and the crop became well ripened. I saw, selected from this half acre, 25 long traces hanging in a row, the best exhibition of seed corn I ever saw at one time. This field was sheltered somewhat from prevailing cold winds, with an inclination to the east, which was favorable for the season, but I consider the results as most extraordinary, and perhaps may be due in a measure to the fact that the land had been so long in pasture, although it was stated to me that it was exhausted by continued cropping, probably without manure, some 40 years ago.

PASTURING MEADOWS.

A paragraph is traveling quite extensively through our agricultural exchanges, recommending pasturing meadows as a means of making them more productive. It gives the name of a practical farmer who has tried it, and is sure he knows that pasturing is the preferable practice. All which shows that there are exceptions to all rules. It is possible that under some circumstances pasturing meadows may be really beneficial; but it by no means follows that it is to be generally recommended. For the great majority of meadows pasturing at any season is undoubtedly injurious. The roots, both of clover and timothy, are very liable to injury by the tramping of cattle at any season. Cropping the herbage diminishes the vigor of the plant. If fed down in spring, it will usually be impossible to get more than half a crop. If fed closely after haying, the natural shelter of the plant and roots for winter is destroyed.

The exception to this is where blue grass or red top completely occupy the soil. Their fine roots are scarcely injured when the ground is dry, and the removal of surplus grass leaves the surface more open to the warm sunshine of early spring. The intense cold of winter on a dry soil will not injure the roots of such a meadow, and there is a positive advantage in having the ground clear and open to the warmth and light of spring.

How much clover is injured by close pasturing may be seen by watching the bad effect which a wagon track has made across the field. The crowns of the clover roots will be found broken down, and the plants make about as feeble and stunted a growth as corn plants would under similar circumstances. The hoof of a horse or cow is little less destructive to clover wherever it touches. Of course, in rich full feed cattle will wander but little and the injury will be less; but whoever expects to get the best result from having his fields seeded with clover should see to it that stock of any kind is kept out of them, and that their crop is allowed to obtain nearly its full growth before cutting.

Field Crops.

JUNE GRASS OR BLUE GRASS.

The Canada Farmer recently published an illustration and description of the qualities of this well known but variously esteemed grass. In Kentucky the Blue Grass is considered the very best of grasses. In an address before a Shelby County Grange, published in the Farmers' Home Journal, Chaplain Blaydes gave the following three prominent characteristics as especially commending it to favor;

First—Its capacity to yield an abundant pasturage. This characteristic of the variety named is apparent to all whose attention has been directed to this matter, as it will yield rich grazing the year round, and may be almost classed with the evergreens. All this conspires to give it a very high place in our favor for winter grazing. It is a familiar fact that in what is proverbially known as the Blue Grass region, this grass has attained a very high state of cultivation, specially for winter pasturage; while in an adjoining and sister state (Indiana), there are a number of counties in which this grass is fostered with a view to both summer and winter grazing.

Second—Its fattening qualities are conceded by all to be equal, if not superior to that of any other grass, and for cattle it has no equal among all the grasses, giving rise to the most savory of meats. Especially for milch cows does its excellence manifest itself, in the rich flow of sweet and oily cream from which the choicest butter is made. I once heard a brother farmer remark that he had a large woodland pasture, set in blue grass, which he usually used for summer grazing; but being advised by a friend to cut the pasture in two and keep one-half of it for winter pasture, he was prevailed on to act out this suggestion, and he remarked that he turned about thirty head of cattle on in the early part of winter, and they remained on it during the winter, without having been fed any, except only when there was snow or sleet on the ground, so that they could not get to the grass. "And," said he, "they kept in good beef order throughout the winter." I mention the foregoing circumstance as it is an attestation of the superior fattening qualities of this most excellent variety of the grasses. Much more might be said in this direction, but I will pass on to the next prominent feature of this variety.

Third—Its capacity to hold the soil from washing away is perhaps more than double that of other grass. Embracing with its network of ten thousand thready rootlets, it thus clasps almost every atom of the soil, and, when it has thus taken possession of the soil, it admits of no rival, forming a heavy, rich, green sward on the surface. Thus, it may be seen that our soil is safest from the ravages of the watery element when in the keeping of this most beautiful variety of grasses.

THE COST OF CORN AND OF OATS.

At a recent meeting of the Lenawee Junction Mich. Farmers' Club reported in the Michigan Farmer the committee which had been appointed to determine whether it was profitable to raise corn, made their report.

Mr. M. Davis, one of the committee, said his crop turned out about 100 bushels to the acre. The cost of one acre was $18.00, and he had placed the value of the corn at $25.00, and the stalks at $5,00, or the receipts at $80, making the profit $12, on the acre. This estimate had been made on the work as though there were only one acre in the piece, which of course raised the expense higher in proportion than if it had been on a larger field.

President Sayles being another member of the committee, had made his estimate as follows. Hired it all done by the month, but had charged by the day against the field. The average day's work in plowing one field of stubble ground was two acres and the charges for it $3.00, or $1.-50 per acre. The harrowing was done at 10 acres per day, and with the same price for man and team, would be 30c for once over, or 60c for twice over the ground which was done. The marking cost 30c. per acre. He planted six acres per day with a corn planter, which he called $1 50 per day or 25c per acre for planting, and charged 20c. per acre for the seed. He used a two horse cultivator for all the cultivating, and averaged through the season 8 acres per day, which at $3 per day, and four times over the ground make a cost of $1.50 per acre for cultivating. He paid $1.25 per acre for cutting up the corn and 5c. per bushel for husking, or $4.50 per day and the drawing and cribbing the corn $1.45 per acre, making a grand total of $11.55 as the cost of one acre of corn. The corn yielded 90 bushels per acre, and he had allowed as credit to the field, two cents per bundle for the stalks, and got 160 bundles, or a total of $3.20, to be deducted from the cost, $11.55, which left as the net cost of the corn in the crib, $8.35 for the 90 bushels, or 9 5-18 cents per bushel. He had also another piece on sod ground, which he had manured well, for which he had charged the field $6.00 per acre. Had charged $2.00 per acre for plowing, as he used three horses; harrowing, $1.20 per acre; marking, 30c. seed 20c; planting, 25c; cultivating $1.50; cutting up corn at $1.25, all same as received in the other field; husking at $6.00 per acre, and cribbing, $1.80, making a total cost of $20.50 per acre of 120 bushels the actual yield, or 17¼ cents per bushel. He replied to a question that his system of farming was to allow no weeds to go to seed, and of course he has less cultivating to do on that account. He had, however, neglected to charge to the field its proportion of the taxes on the farm, and its interest on its money value.

The committee on the oat crop were then called on for their report. C. C. Whitmarsh first made a report on his crop, just as he had done the work. The ground 20 acres, had been prepared for wheat the fall before, and he only used the cultivator. The account stood as follows:

Five days with cultivator	$15 00
Two days with roller	5 00
Two days drilling	6 00
Seed—1¾ bushels per acre	18 90
Harvesting	40 00
Drawing, threshing and loading	50 00
Total cost of crop	$135 90

He had credited the crop with

815 bushels of oats at 39c. per bush	$317 85
The straw he called worth	50 00
Total income	$367 85
Deducting the total cost	135 90
Profit on the crop	$231 95

This makes a net profit per acre of $11.59¼, and a net cost per bushel of 16¾c.

Martin Bowerman had a report of 4½ acres, and his account stood:

Dr.

Three days plowing	$9 00
Half day sowing and harrowing	1 50
12 bushels seed at 67c. per bush	8 04
Harvesting	7 50
Drawing to the barn	4 00
Threshing, all told	13 00
Total cost	$42 04

Cr.

265 bushels oats at 40c. per bush	$106 00
Straw	20 00
Total income	$126 00
Deducting cost	43 04
Net profit	$82 96

This made $23.70 profit per acre. The net cost per bushel was only a fraction from 16¼c.

FARMERS AND THE CORN PREMIUMS.

Conrad Wilson in the last number of the Christian Union makes some interesting comments on the responses he receives from farmers relative to the Centennial Corn Premiums.

It is evidently the intention of many to test this cereal more thoroughly during the coming season than ever before.

One man writes to me from Ohio that he has a clover field of ten acres that was thoroughly top-dressed last fall with a view of planting it to corn this spring. He has always made corn a leading crop, and once got nearly a hundred bushels from an acre. He now intends to make an extra effort, and whether he wins a premium or not he is confident of getting an abundant yield, and *that*, he says, with much truth, will be itself a prize worth contending for at any time, and still more so on this occasion.

Another farmer, in Kentucky, writes that he intends to compete for several of the offers, and especially for the largest yield from a single grain, because he thinks he will thereby get a better quality of corn, and heavier weight, and will prepare the way for a larger yield by the acre in after years.

An enterprising widow who has a flourishing farm in a Western State writes that her late husband, "previous to his recent death, was for many years connected with the Board of Agriculture, and received the highest premium for the most productive farm in the State," and adds that she "intends to compete for these Centennial premiums."

Other letters of similiar import to these are continually coming to hand, and all of them indicate the same growing interest in the culture and development of the corn crop.

Onions are extensively and profitably grown by some farmers. On clean soil they cost no more per bushel than potatoes.

Dairy Husbandry.

NATIONAL BUTTER AND EGG ASSOCIAT'N.

THE Third Annual Meeting of the National Butter and Egg Association was held at Davenport, Iowa, the first week in March. From the report of its doings in the Prairie Farmer, we gather the following items:—The meeting seems to have been a success, though few producers were present, the attendance being mainly of leading dealers from New York, Philadelphia, Baltimore, Chicago and other cities.

In the address of the President—GEO. E. GOOCH of Chicago, it is stated that two-thirds of the butter made in the West brought less than 16 cents per pound to the producer, and the belief was that if it had been made by the creamery system at least from 25 to 30 cents could have been obtained for it.

EXPORTS OF BUTTER AND CHEESE.

The Sec'y, R. M. LITTLER, gave a statement from official sources, showing that the exports for the year ending June 30, 1875, to have been: Butter, 6,360,287 pounds, valued at $1,506,996, and of cheese 101,010,853 pounds, valued at $13,659,603. The exports of cheese to Great Britain and Ireland were nearly 90,000,000 pounds. The imports to this country during the same time were of butter 1,199,620 pounds, valued at $319,470, and of cheese, 3,120,112 pounds, valued at $518,357. The duty on both butter and cheese is four cents a pound.

OLEOMARGARINE.

The committee in regard to the adulteration of butter with oleomargarine reported that as there was now no adulteration of butter with this material, there was no need of legislation on the subject; but a resolution was adopted recommending that oleomargarine, when on sale, should be branded as such.

GOLD MEDAL FOR BUTTER AT THE CENTENNIAL.

The committee on securing a display of dairy products at the Centennial, recommend that a gold medal of the value of $50 be awarded for best package of butter of no less than 50 pounds, to be shown at each of the two special displays, June 20 and October 17, and this recommendation was adopted.

PACKAGES, SHIPPING, &C.

L. E. FITS of Chicago urged the importance of the best packages and packing of butter for market. Butter should be graded and sold on its merits. Mr. HERMANCE of New York believed that commission merchants should keep shippers informed as to the state of the market, prices, &c., but it was not safe for him to predict prices. Shippers should not get into such a competition as not to allow a safe margin. Five per cent. commission is as little as is safe in the business.

Mr. RICHARDS of Chicago urged the importance of shipping butter when fresh; he opposed the policy of holding it in hopes of higher prices as resulting in losses.

In regard to packages, it was stated that the New York summer trade prefers oak firkins, which should be of good weight, 20 pounds. Correct tare should be marked or branded on the package. Fall trade requires tubs. Roll butter should not be shipped in large packages, but in kegs and tubs. Prints should not be packed with large rolls. Welsh tubs are liked. Chicago prefers tubs to half firkins. The oak for packages should be grown on high and dry ground as that from low, wet ground, allows the brine to soak through and spoil in appearance.

FREIGHT ON BUTTER.

The freight on butter from Chicago to New York, it was stated, was $1.10 per 100 pounds, with no reduction for large quantities. Bacon is shipped for 50c. and cheese for 65c. The rate from East to West is lower than from West to East. Counting out packages, the net freight from Chicago to New York is $1.35, or $1.40 per 100 pounds. The reason given by the representatives of the railroads was the greater value of butter and the increased cost and weight of refrigerator cars.

CHICAGO RECEIPTS OF DAIRY PRODUCTS.

It was stated that during 1875 Chicago had received nearly 15,000,000 pounds of cheese and over 30,000,000 pounds of butter.

The election of officers resulted in the following: President—GEORGE E. GOOCH of Chicago; Sec'y—R. M. Littler of Davenport, Iowa; Treas.—E. L. Kemp of Baltimore, with one Vice-President from each State.

The next Annual Meeting is to be held at Chicago on the first Wednesday in March, 1877, and a special meeting October 17, 1876, at Philadelphia, the time of Special Dairy Show at Centennial.

OPENING THE CHEESE FACTORIES.

THE silly advice of J. H. REAL of Philadelphia, urging cheese factories to delay commencing work until the first of May, shows an ignorance of dairy matters which raises a smile on the faces of most dairymen to whom the project has been presented. Mr. REAL proposes that the cows be made to stop having calves until May; or if they come in milk earlier, he would have the dairymen make butter at the farm or give the milk to hogs or other domestic animals, or we suppose throw the milk away—anything, so that it be not made into cheese. This course, he thinks, will enable dealers to get rid of their stocks and cause a scarcity in the market, and as a matter of course enable dealers, who have stocks of cheese of their own, to realize a large profit in the disposal of their goods. But cows at this season (March 8) are rapidly "coming into milk," and no persuasion of dairymen or Philadelphia dealers will be able to induce them to delay the necessities of nature. Again, the cheese dairymen depending upon the opening of the factories at an early day, have no convenient buildings and utensils for setting milk and making butter, and hence the milk must be fed to animals or thrown away during March and April.

New York dairymen are not likely to look with favor upon this proposition of the youthful REAL. A correspondent of the Little Falls Journal says:—"Mr. REAL advances four categorical reasons why the opening of factories should be delayed, the sum of the argument being that decreased production will induce enhancement of prices. So far as it goes, this will apply equally well to any other branch of trade or business; but we do not hear of *grain merchants* advising farmers to keep back their grain and feed hogs with it, for the express purpose of raising the price of grain in the warehouses throughout the country. Nor is it common to hear of woolen manufacturers recommending the contraction of production, in order that artificial prices may be realized for their fabrics on hand.

If the proposal to delay opening the cheese factories were followed, its only result would be to put money into the pockets of dealers who have stocks of last year's cheese on hand, without in the smallest degree benefiting dairymen. Whatever may be said against April cheeses, it is undeniable that they generally bring the highest prices; and while this continues dairymen are not likely to inflate the butter market by abandoning cheese making to turn their milk into butter. The proposal to make cows come in later is not likely to be followed by dairymen who understand their own interests; for early cows pay best, since their full yielding season continues much longer. For instance, cows "coming in" the middle of May, will commence to shrink the same time as those that calved in the beginning of April.

Dairymen must consider their own interests while they are endeavoring to improve or keep up the high standard of the American cheese market, and it is not to be supposed that they will relinquish their most profitable produce without obtaining an equivalent in return.

GEO. W. DAVIS, a noted factoryman of Herkimer Co., N. Y., in referring to REAL's foolish proposition, says:—I have had 20 years' experience in the dairy and ten years in a cheese factory of from 500 to 800 cows, and it has ever been the fact that the early and late milk has given the best cash returns; and why? Simply because the demand was greater in proportion to the supply. Would the dealers pay more for the early make if they could not pass them into consumption? certainly not. But Mr. R. claims that they hinder the sale of grass cheese. The very reverse has ever been the argument by dealers here and I fail to see the point that what has preceded should lessen the price of better goods. One point more—the propriety of utilizing the early milk in the production of meats. This theory with us was exploded forty years ago, and hence the practice of slaughtering the calves at four days old. And again: we are told that if a part of the cheese product was cut off, we should realize more for the remainder.

Now suppose this Mr. REAL should approach the grain grower whilst busy with his reaper: "Sir, had you not better leave a part of this fine crop of wheat and turn in the swine, to the end that you may have more pork and better prices for what you do harvest? Would he indorse that? No. And yet it would be a parallel case to the subject in question.

We should advise our youthful Philadelphia friend to gain a little more experience in the ways of dairying before sending his letters of advice to New York dairymen. The cheese factories of New York are now being rapidly opened, and cheese is being made as in former years. Mr. REAL's plan may do well enough for Philadelphia dairymen, but it won't work in New York.

PLAN FOR SETTING MILK.

X. A. WILLARD:—You will do me a favor by giving me an answer to the following question: In your opinion, what is the best and most convenient arrangement on sale, and where can it be had, for setting milk in a spring house for making butter only from 200 or 300 cows?—ALBERT W. MORSE, *Easton, N. Y.*

ALL the recent plans for setting milk are very fully described in the "Practical Butter Book," lately published at this office. We could hardly answer our correspondent definitely without knowing more in detail concerning his building, conveniences for water, &c., &c.

Sheep Husbandry.

SHEEP HUSBANDRY IN COLORADO.

EDS. RURAL:—Permit me to answer in the RURAL some of the many questions asked me by anxious inquirers in the East, frequently by mail. I came to Colorado with my family in June, 1874, to get relief from asthma, from which I had suffered much for thirty years, and found here complete relief. This climate I believe to be a specific for this most distressing complaint.

I removed here from the far-famed Genesee Valley in the western part of the State of New York, and brought with me three car loads of pure bred Spanish Merino sheep, bred with much care for ten years, from choice selections of several of the best flocks in Vermont. Shipping in excessive hot weather and acclimating, my losses were about 5½ per cwt. Since they have become acclimated they have done remarkably well. In the winter of 1874-5 I fed to my entire flock of about 1,000 (part Mexican) about six tons of hay, costing $10 per ton. The Mexican sheep ate very little hay. It being the first winter in Colorado for my Merinos, they required more than usual. January was considered the most severe cold since 1869; but with the exception of about ten days of severe cold, it was much the finest winter I had ever seen—very little snow and many fine, sunny days. Messrs. THIMBLE & TODD wintered 1,500 Mexican ewes, herding them near Fort Collins, in the cache at La Paredre Valley. Mr. THIMBLE informed me recently, he had lost none and fed very little hay, and his sheep wintered finely. Several other sheep men wintered near here, from 800 to 1,000 each, with no loss, and fed no hay or grain.

My friends East considered me an authority upon sheep husbandry in Colorado, but I must say my expectations have been fully realized. One man can easily herd 1,500 on the plains and 1,000 among the foothills. First-class herders usually get about $20 per month and board. It is necessary to have sheds to protect sheep from winds and occasional storms which may, at some seasons of the year and at rare periods, be severe, though many flocks are wintered or corraled nights in board and some in open pole pens without any cover, and daily graze the year round. The best time for our lambs to drop is from May 10 to June 10, it then being warm, fine weather, and the ewes have plenty of green feed and give abundance of milk. I think with good care and proper management, 80 per cent. of lambs can be easily raised from Mexican ewes; I have heard of 125 per cent. increase. Mexican ewes are very prolific. Nearly all Mexican flocks here are crossed with Spanish Merinos, and much more attention is being paid to procuring pure bloods for this purpose than formerly. Many sheep men have been imposed upon by sheep dealers and peddlers from the East, selling them grades for pure blood Merinos and giving pure pedigrees. One pure blood for grading up a flock of native or Mexican ewes, is of more real value than a hundred grades; hence the necessity of obtaining pure bloods to cross on Mexican ewes. The increase in wool when pure bloods are used is about doubled the first cross. The Mexicans clip here from 2½ to 3 lbs. and cost from $2 to $2.50 per head, delivered here in Northern Colorado. The third cross have cut in some cases over eight lbs. to average the flock, and in some choice ones over 10 lbs. of fine wool, which sells here for about 2c. less than in Boston. The Merino cross make a very hardy sheep, well adapted to this country. The half breeds make excellent mutton.

This is naturally the home for the sheep. I fully believe it to be as fine a stock country as any in the world, though not in productive capacity, and it seems peculiarly adapted to sheep husbandry. Capital is being rapidly invested here in this industry, which it is expected will pay from 80 to 100 per cent. above expenses with proper care and prudence. Colorado is supposed to be capable of sustaining 30,000,000 sheep, and if the introduction of Alfalfa (now being introduced) should prove a success where it can be irrigated, as many now confidently anticipate, its pastural capacity will be immensely augmented—sufficient to sustain 100,000,000 or more, of sheep. It has been estimated from a few experiments, that one acre of Alfalfa (Lucerne) will sustain 20 sheep, but I think it a more safe calculation to say ten to an acre, which will very materially increase the capacity of this country for growing stock and wool. Alfalfa can be cut three times here in a season, yielding six tons of dry hay per acre, and is much preferred by stock. It can be mowed once in six weeks and produce much pasture after the third cutting. Its rapid growth, and preference by stock, make it a most desirable forage plant for this country. It is believed from careful estimates, there are now in Larimer County alone at least 100,000 sheep, and that the natural increase, and annual importation from New Mexico and the States, will double the number annually in this country until it is stocked to its full capacity, and thus swell the aggregate of this most productive industry in Colorado, as before stated, to at least 100,000,000 of sheep, producing 450,000,000 lbs. of wool. We hope to make this the banner County, if it is not already, in the production of wool, and wool growing promises fair to be the leading industry in this Territory. And I believe near and on the foothills are to be found the best water and the most desirable place for sheep ranches, though sheep do very well on the plains far away from the foothills where water can be obtained, but wood and timber are not as convenient. Inside the foothills and even among the mountains, there are many forks and valleys well adapted to grazing which are being rapidly occupied by flockmasters and stockmen.

Now, when it is well known that sheep graze here the year round, requiring little if any hay or grain, it is easy to see that this industry is very remunerative. Sheep husbandry is a very safe business; sheep keeping very healthy here. Soon the most desirable ranches will be occupied and these rich and most nutritious grasses now annually wasting, will be fed off by stock and made to produce immense herds of horses, cattle and sheep, and millions of pounds of wool, thus enhancing the wealth of Colorado many millions of dollars. Mr. A. F. CLINTON, formerly Secretary of the Wool Growers' Association, writes:—"The climate of Colorado is admirably adapted to sheep husbandry. It is temperate, which, for raising sheep in large numbers, is an absolutely essential point. The marked success of our sheep men, who have been only some four years in the business at most, with no previous knowledge of its requirements, fully prove the suitability of the climate and grasses. The Buffalo and Gramma grasses are special favorites and deservedly so, as for native grasses, they contain more fattening and life-giving properties than I have ever seen."

It is grass in summer and cured hay in winter, and no drouth kills it or diminishes its nutritive qualities. The risks attendant on wool growing in Colorado are nominal—serious losses only arising from ignorance or carelessness, or both. Those wishing to come to this country to engage in sheep husbandry cannot fail, with proper care and intelligence, as nature has provided the rest. Water excellent and ample for stock, and grasses good all the year. Sheep husbandry is attracting much attention in Colorado, as it has been satisfactorily demonstrated that wool growing here is a most profitable and lucrative employment. It is yet in its infancy, but is being rapidly developed. This spacious pasture land, once the home of the savage Indian and countless herds of buffalo, has now become available for the sustenance of many millions of domestic animals, thus adding many millions of dollars to the wealth of those who occupy it. The native red men have been removed from nearly all of Colorado, by the Government, to reservations set apart for them, where supplies are generously furnished them. They are being taught agriculture on some reservations, and there is no more danger here from them than in the East. The railroad facilities make it easy to approach almost any portion of Colorado suitable for grazing, and offer a grand opening for the wool grower and stock raiser to follow their chosen occupation with comparatively little labor, and the certainty of ample and remunerative profits on the capital invested.

Colorado embraces 67,500,000 acres, about two-thirds—or perhaps three-fourths of which are grazing lands. The balance is mountainous and much of it rich in the precious metals, which adds greatly to the wealth and prosperity of the Territory. For about 300 miles west of the Missouri River, rains fall sufficient for crops, while west of that line Agriculture is not remunerative without irrigation and only a small portion, or perhaps one-twentieth of the whole, can be irrigated from all the streams available. These lands west of the rainy belt are the lands that produce sparsely the Buffalo and Gramma grasses, that are believed to be the most nutritious of all grasses. Stock growing west of the rainy belt is considered much more remunerative than where sufficient rain falls for crops, because there the grass remains green until the frost kills it, and then it is bleached and drenched with rain, snow and dew, depriving it of much nutrition—while west of said rainy belt the grasses dry up perfectly cured hay before frosts come, and we seldom have any dew, rain or snow to bleach or wash them in winter, consequently they retain their nutritive qualities the year round. The entire growth of grasses for the year is generally in April, May and June, and they usually dry up in July and August. Locations near the Rocky Mountains or foothills are considered preferable for stock in winter—the mountains affording protection, but principally on account of the cool, pure water and supplies of wood, timber, lumber and stone, which the mountains supply in abundance.

With such an immense country well adapted to wool growing in our own land, is it not surpassing strange that we import fifty million lbs. of wool and as much more in woolen manufactured goods annually? If the present tariff on wool and woolens is preserved intact, so as to impart confidence in this industry, will not the time soon come when we shall grow all the wool, and more, that this nation may need for home consumption? I think so. JOHN SHELDON.

Fort Collins, Larimer Co., Colorado.

REMARKS.—Thanks to Mr. SHELDON (whom we recognize as a former successful sheep breeder and wool grower in Western New York,) for his very interesting, suggestive and instructive article. We shall be glad to hear from him occasionally, and trust he will furnish us a paper on cattle raising and grazing in Colorado.—[ED.

Industrial Topics.

WASTE CITY FERTILIZERS.

The Germautown Telegraph says:—The discovery that dry clayey earth was a thorough deodorizer, an article utterly destroying all bad odors, would, it was hoped, work a great revolution in the closet system of cities; and, while aiding in promoting public health, would provide farmers with one of the best and cheapest of fertilizers. In this way the earth-closet was invented, and it was hoped that its use would be almost general.

It is clear, however, that these institutions have not become as general as was hoped and expected, and farmers have derived no benefit in the way of cheap fertilizers from their introduction. A few years ago a company was organized in connection with this idea, from which great things were expected. It was called the Fertilizing and Sanitary Company. They furnished the closets, supplied the dry earthy material, and cleared away the whole contents once a week for the sum of twenty-five cents. They manufactured from this material an excellent fertilizer, which they sold in barrels at $50 per ton, and which was found to be superior to guano at the same figures. But we have heard nothing of this company for some time. Certainly the idea has not been contagious. There has been no attempt to compete with it in the profits; and we rather think the whole thing is dead. The closets themselves are in use occasionally, but not near to the extent that was hoped for on their introduction.

The reason probably is the same as that which is so often given for so many other of our shortcomings. That which we can do with the least amount of labor, even though it may be not the best way of doing things, is sure to prevail. The daily application of earth is a sort of task, and one which the careless are almost sure to neglect; and the continued weekly visit of the scavenger would soon be voted a nuisance, unless the structure could be so arranged that the visitor would be unseen during his visitations. It is so much easier to trust to running streams carrying off through sewers the whole refuse of our households, or to have a visit only in a year or so from the nightman, that some risk of health is willingly run rather than to have this continuous labor. It is to be regretted that this is so; to be regretted not only for the sake of public health and many other public reasons, but also on account of the loss of so much valuable matter to our agricultural operations; but we fancy that unless the difficulties of continuous attention and frequent visitations can be removed, we are not likely to profit much by this very interesting discovery of the absorption of odors by dry soil.

NOTES ON THE RURAL FOR MARCH 4th.

Potatoes as a Food for Stock.—The article on page 150, from the New York Sun, takes the ground that potatoes are a good food for most farm stock. I can go into no chemical discussion of the matter but I consider that if you take potatoes and boil them and when well cooked, and while yet warm mash them, mix with them corn and oats ground together and bran, in proportions of 4 parts of potatoes, 1 of corn and oats and 3 of wheat bran, you will have a splendid food for young pigs and growing chickens, and in fact the best kind of a summer food for laying hens; the trouble is the amount eaten. I had 100 chickens and fowls and one small pig last fall, and they would eat a barrel full of the mixture in two days.

A Workshop on a Farm.—The more the better. It is a capital place to bring out one's talents. A friend of ours, who market gardens 30 acres, considers that his shop brings him, or saves him $150 per year.

Peerless Potato.—I endorse all that is said of this variety, it is the standard late potato here; many call it as good as the peachblow, but we do not think so, we consider the Compton's Surprise the best late potato, and the Peerless second. As we have to fight bugs, we want potatoes that yield well. A. M. Van Auken.

Fort Howard, Wis.

NEW WAY TO KILL GRASSHOPPERS.

Fears are entertained that the Western grasshopper or locust will prove destructive the coming season in some localities. The following method of destroying grasshoppers devised by Ferdinand Riemann of Montana we take from the Rocky Mountain Husbandman:

It is well known that the ordinary coal oil is one of the surest means of killing grasshoppers, and during the payment of the bounty in this county it was used quite extensively to kill the insects before marketing them. And coal oil is the chief of Mr. Riemann's plan for killing the grasshoppers. He says that the smallest particle that will adhere to one's finger, if touched upon the body of an insect will cause almost instant death. He takes a piece of cotton cloth a yard wide, and about twenty feet long. One side he fastens to a rope, the ends of which extend over the cloth a foot or two. To the bottom of the cloth he fastens, say one foot apart, lead sinkers, of sufficient weight to keep the cloth firmly stretched. The cloth is then soaked in coal oil until thoroughly saturated, and with a man at each end this apparatus is slowly dragged over the ground occupied by the insects. Every grasshopper touched by the oil is instantly killed. The cloth is soaked from time to time, as one's judgment dictates. Mr. Riemann says the first soaking consumes a good deal of oil, but afterwards much less is required, and he estimates that one and a-half or two gallons is all that is necessary to kill the grasshoppers on eighty acres. The process is to be applied as soon after hatching as possible, when the grain is small. Where it touches the grass or weeds more or less oil adheres, and this kills such insects as come in contact with it. Mr. Riemann tried the method last spring, and it worked to his complete satisfaction, destroying the grasshoppers upon his premises, and what injuries were sustained by his crops were traceable to insects that came upon him from other localities.

QUESTIONS ANSWERED.

Eds. Rural:—I would like to have you, or some of your readers, answer a few questions for my benefit: First—Is it advisable to have the posts in a barn more than 16 feet high, where there are to be bays on either side of the floor? Second—Is there any roofing better than pine shingles, or more economical? Third—What are the best fastenings for cattle that are to be kept in the stable winter or summer?—w. *Jamestown, N. Y.*

One of the greatest expenses in building is roofing. The higher the posts the less cost for room gained. Eighteen feet posts with basement make an excellent barn. J. R. Garretsee of Rochester, N. Y., has a new style of roofing which promises to be superior to shingles, also cheaper. It is made of grooved boards, tightly battened and clasped.

Gifford's patent stanchions, made in our correspondent's own town, by W. C. Gifford are the best we know of. Is a prophet not without honor in his own town that Mr. Gifford's neighbors send to us to recommend his stanchions?

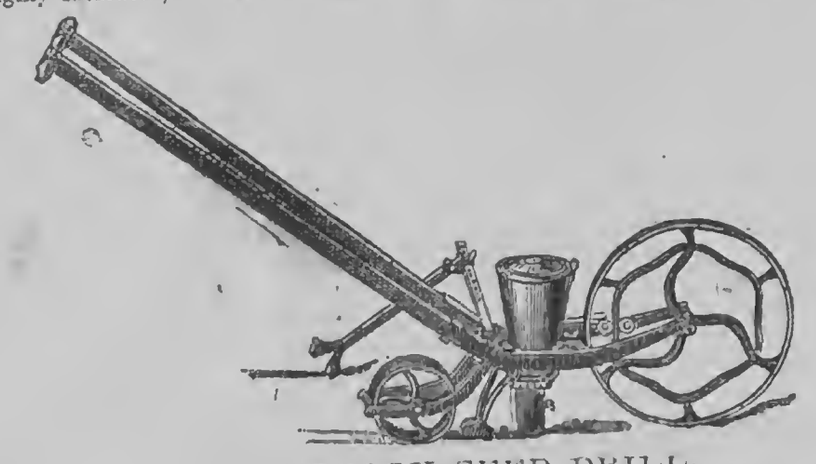
CHICAGO GRAIN TRADE.

Chicago, the largest grain market in the world, handles about 90,000,000 bushels annually and has now in operation eighteen steam elevators, with a capacity of 15,350,000 bushels, or more than the average product of 1,000,000 acres of the fertile wheat-producing lands of the continent. Their capacity varies from 200,000 bushels to 1,500,000. The entire cost of the eighteen elevators now in operation was about five million dollars, exclusive of the cost of the grounds on which they stand.

Industrial Implements.

THE HOLBROOK SEED DRILL.

As the season for out-door garden operations approaches, farmers and gardeners begin to prepare for seeding and weeding. At the outset a good garden drill is found to be indispensable.



THE HOLBROOK SEED DRILL.

No skill nor practice can distribute the finer seeds so evenly as a good drill will do, and even distribution saves a great amount of vexation and labor, and often the total or partial loss of a crop. This is especially true of onions, which, with many farmers, have become an important and staple crop. Holbrook's new Regulator Seed Drill, an engraving of which is herewith given, it is said fills all the requirements in a drill for garden or farm use. It can be easily and quickly adapted to seeds of different sizes and weights, and by means of the open seed conductor the seeds may be plainly seen against a white surface while it is in operation. This is a peculiarity of the Holbrook Drill, and enables the operator to be sure at all times that his machine is working truly. A great number of farmers and gardeners in all parts of the country have these drills, and all speak favorably of it. Those wishing a drill should write to the manufacturers before deciding which to buy.

The price is only $12, and it will save that sum in one day where onions, or other small seeds are to be sown, doing the work promptly before weeds start, and distributing the seeds more evenly than they could be by hand. It is manufactured by E. E. Lummus & Co., 32 South Market St., Boston, Mass.

THE TAYLOR SULKY RAKE.

Ruth, the gleaner, is not a prominent character in modern society. There may be characters like Ruth; but no gleaning is left for them to do, and so they all begin their story as the original Ruth ended hers—by getting married. Thrifty American farmers have learned that it pays well to glean their harvest fields, and improvements in machinery have made this work comparatively cheap and easy. Among those who have taken the lead in this is our genial friend B. C. Taylor of Dayton, Ohio, who has for twelve years been manufacturing sulky rakes of various styles and patterns, has made and sold 45,000 of them, taken over 1,200 first premiums at Agricultural and World's Fairs, and is now preparing to supply larger orders for 1876, than in any previous year.

As each rake will, on an average, save more than its value in grain per year the gain to farmers must be immense. With a moderate crop the wastage on unraked stubble is often equal to a tenth, sometimes an eighth of the whole amount. Of these approved rakes, Mr. Taylor makes six different styles, adapted to different parts of the country and different kinds of work. All have cast steel teeth, tempered in oil, and oval in shape, giving the greatest possible strength for the weight. Each tooth is entirely independent, held firmly, and can be taken out and replaced by a new one, in case of accident, by any farmer. These rakes have competed successfully with all others in the country, and the number sold is evidence that they are liked. We learn that Mr. Taylor has orders for and is shipping a large number of rakes abroad this year. It seems a pity when a boy and horse will rake over fifteen or twenty acres per day with one of these rakes that the work should anywhere be left undone or done by hand.

The No. 1 Rake is the style generally in use in all parts of the country for heavy work in grain or hay, corn stubble or brush, or newly cleared ground. No. 2 is with high wheels, and longer and heavier teeth, adapted to the heavier work on the Pacific Coast. No. 3 is a "drop tooth," the teeth sliding and dropping into depressions. This is adapted to very uneven ground, though other styles will work well with any ordinary depressions. No. 4 is a self-dumping rake, discharged by the horse, and is so arranged as to be operated by hand or foot at option of driver. No. 5 has less machinery about it than any other, and is gotten up in the simplest and most inexpensive manner. Farmers who have not a good rake will find it to their interest to send to B. C. Taylor, 228 West 5th St., Dayton, Ohio, and receive circular with full description of each style and price. If there has been no agent in their neighborhood, probably several of these rakes could be sold the coming season.

The Horseman.

HEAVY DRAFT HORSES.

The price of these animals has risen in England, and there is a demand for them in the United States so that it is safe to breed them for a regular source of income. Having raised a great many in England, and lived in a part of that island where some of the finest were sold to supply the London demand, I can say with confidence that in the course of years more might be made than from trotting strains or thoroughbreds, because in breeding fast horses there is only one now and then in twenty or thirty which come to make the large sums so coveted, and those which fall in speed sell low, whereas, if draught horses are bred there are comparatively no failures, every colt at four years old being sure to sell for from $400 to $600. Thus, as said in Virginia or anywhere further South, the colts would, up to that age, cost nothing but their grazing, excepting a little feed the first winter, from which any one can see much more could be gained than by breeding animals of uncertain results, for the fashionable cattle of the present day, with their unnatural treatment, cannot be depended on to breed or live.

There is no mistake in saying there is no extra expense at all required with these brood mares and colts, two men would do everything necessary for a breeding establishment, which would bring out annually 50 horses worth $500 each. In short they would cost no more than the mules in Kentucky and would make double the money. As the price of oats, corn and other produce runs, everybody must be aware that breeding horses must be far more profitable than plowing and sowing so much, and especially where as in so many districts the natural grasses make such fattening pastures and would also cut good hay the same as English old meadows and old upland do. Sheep and cattle can be kept and raised profitably with horses, in fact, all permanent grass is benefited by being grazed with a variety of live stock, and each kind of animals do better for having the others to help eat the grass, and the heavy draught horses are better among sheep than the high-blooded race-horses, as the latter will often in play run sheep and injure them.

If some of the great monied men of the cities would invest in land which, from the expense of free labor, cannot be employed to advantage in growing cotton, they might get it for as little as the Yorkshire breeders of England pay annually for rent, which in a few years would improve by grazing, or they could get good new land in grass regions which would be as cheap according to its productive power. However, this would not matter, as if it took five acres or even ten to support as much stock it would cost no more than one acre, and, if adapted for the purpose, it would improve every year.

Sheep cause pasture to thicken, and if they were well managed in conjunction with horses and some cows too, the wool, mutton and beef would all tell together. Horses, too, of the great powerful "van horse" stamp will pay well and would come in should the heavier "cart horse" breed be over and above produced, which though is not at all probable. When instead of gambling and speculating in stocks or railways, &c., wealthy men turn their attention to real estate as the aristocracy of England do, and on account of the difference in difficulty of finding tenants make fine stock raising establishments, the soil will cease to be bereft of all its fertility, and the tide of prosperity in agriculture will turn.

Around the Republic.

FROM AND ABOUT FLORIDA.

IN REPLY TO CRITICISMS OF AN EX-EDITOR.

EDS. RURAL NEW-YORKER:—I have been much amused, and occasionally somewhat indignant, at your Ex-Editor (Jacksonville) correspondent: but, after all, I suppose it is pity more than anything else that he is entitled to. To have grown into such a chronic state of grumbling and fault-finding, it must have been made a constant study with him for years back to have arrived at such a degree of perfection—but perhaps his health is such that he can only see us "through a glass darkly." Enjoying good health myself, I do sincerely pity and sympathise with those who are otherwise. But why will such persons persist in writing for the press and try to throw their dark, fault-finding, gloomy state of temper over all creation, as well as themselves.

Northern born and Northern raised, I moved down here last June for the purpose of engaging in gardening and horticulture. Came from Nebraska here—am better pleased and better satisfied than I expected to be, and think it the best move I ever made. Have been here not quite nine months; in the mean time hunted up a location, bought lumber, and built myself a decent and respectable house. Cleared out an old deadening, experimented on vegetables of different kinds through last fall and winter, lost a month through sickness last fall, and now have a good-sized garden under way, from which I shall soon commence shipping vegetables North. Besides, I have a nice lot of seedling oranges and lemons growing, a few three-year-old trees set out, an asparagus bed started, and a few hundred grape cuttings rooting nicely. But Mr. Ex-EDITOR thinks Florida is all a sand bank, and that guano is worse than nothing to attempt to fertilize with. Let him give me a call, Mr. RURAL. I will show him tomato vines as dark green, thrifty and promising as any he ever saw, now hanging full of blossoms and standing from 15 to 20 inches high—cucumbers running nicely, and many vines with 6 to 8 cucumbers already on them. And what was the magic wand to put the spell on them? Two or three waterings with a little guano water. Sand we have here, but it is a very profitable kind of sand to those who have the will and energy to *intelligently manipulate* it. Let me see what was it I had for dinner yesterday, all from my own garden and of my own raising. New potatoes, young and tender turnips, green peas, and to top off with, strawberries, large, melting and delicious, and with the true flavor and aroma so often found wanting in many places. Again, Mr. Ex-EDITOR says he has never been anywhere in the State except Jacksonville, and yet he thinks that by talking to a few disappointed men besides himself he knows all about it. That he is sadly mistaken, many of us who are now prosperous and comfortably situated well know. ARCHER.

Archer, Alachua Co., Fla., March 13.

A SOUTHWEST MISSOURI EL DORADO.

BILLINGS, Christian Co., Mo., Feb., 1876.

OWING to the large number of letters I have received from New York, Pennsylvania, Wisconsin, Indiana, Ohio, Iowa and other States, asking for intelligence about the land in Southwest Missouri, and owing to the very little time at my disposal, I feel it sometimes difficult to answer all separately and satisfactorily. I therefore deem it wise and becoming to give my correspondents all required intelligence as briefly as possible and by means of the press.

The winter is never extremely cold here. The days in summer are never so intensely warm that we cannot wear a cloth coat, and the nights are so refreshingly cool that we can always sleep under a blanket. We have no mosquitoes, no grasshoppers and no insects of any kind to annoy us or to take away our crops. We challenge America to produce better water than the water of Christian County. What shall I say of the products of the soil—of the lovely vineyards and gardens full of vines and fruits and vegetables of every kind—of the fields covered over with a plentiful harvest—of the beautiful and almost endless prairie, giving countless tons of fine hay, and fat cattle of every kind to the farmer; of the lofty and majestic forests; of the subterraneous stores of zinc, lead, and precious minerals of every kind, and of the wells of pure water spontaneously bubbling up by the roadsides, sometimes forming grand and noble rivers, rolling proudly on and turning many and different kinds of mills before mingling their limpid waters with the far-off, foaming sea! A minute and worthy description of this mighty mining, grass, fruit, corn and cattle country would far transcend the limits of a letter, and trespass on the time and space of the press.

It has often been a source of no little surprise to me why some of our great capitalists do not come out here and invest in land that is destined to make one of the greatest farming countries in America; and I am not a little pained, from time to time, when I reflect upon the large number of poor families living in our large cities and depending, in a great measure, upon a man's daily wages for support, and that, too, at times when employment is very irregular. Why do not such persons come to this "El Dorado" of plenty and purchase a little land, where they would be independent and happy in a few years?

HUMEA ELEGANS.

There are at present in this township those who came here five years ago with very slender means and whose individual property to-day is worth more than $7,000. I will answer all letters willingly, as will also my friend, Dr. A. G. LANE, a farmer and physician, who has a beautiful farm adjoining this town, and who, from his extended and exact knowledge of this country, would be able to give satisfactory responses to all letters that may be written him.

We most cordially invite all who desire to locate in a country more fertile than Egypt, a climate milder than Italy, an atmosphere more salubrious than that of New York, to come to this favored place of ours. We have schools, colleges and churches; and so bring your children to educate them, also your young men and maidens, that you may establish them in homes of beauty, plenty and content.

GEO. A. CULBERTSON

The Apiarian.

MANIPULATION OF BEES.

THE great bug-bear among young bee keepers is the danger of being stung. To remove this danger Rev. J. W. Shearer in the Bee Keepers' Magazine gives some suggestions which will be invaluable to those handling bees

Bees filled with liquid sweets never volunteer an attack. How can bees be made to fill themselves with liquid sweet? In many ways. Whenever bees in a hive are frightened, they at once fill themselves with honey to prepare for any emergency that may arise. Bees fill themselves with honey before leaving the hive in natural swarming. This is the secret of the ready handling of a swarm. They have prepared themselves in this case. Sometimes a few unfilled bees join a swarm and are troublesome, but generally the whole body of a swarm are well filled and peaceable so that they can be handled without danger. When the manipulator wishes to make bees fill themselves with honey the simplest way is to make rolls of dry cotton cloth, five or six inches long, to slip under the entrance of the hive. Light it with a match, place it on a piece of tin to prevent charring the stand, and shove it under the entrance of the hive. In a few moments the bees will have filled themselves with honey. The hive can then be opened and the bees handled with impunity

Every bee-keeper should have these rolls always ready. In the midst of a honey harvest hives may be opened without danger, but when little or no honey is gathered the bees are much more cross and need to be subdued before attempting to handle the combs. Bees are always handled more easily in the middle of the day. Then many of the bees are abroad, and the honey board or quilt and frames are loosened without jarring the combs. The propolis with which they are glued is soft after the hive gets warm. In the morning and evening it is brittle. There is a popular, but most erroneous, idea that bees may be best managed at night.

Never open your bees at night, for they are more cross than in the middle of the day. They are necessarily more jarred in loosening the frames and more easily excited. When they fly out many will not return to the hive. They will remain on you, crawl up your sleeves or under your clothes, and are much more difficult to get rid of. In the day they fly and rejoin the swarm. The most expert apiarian is almost sure of being stung if he open his bees at night. Bees are quickly subdued by sprinkling them with sweetened water or sirup. They greedily devour it and become peaceable. This method is not generally to be recommended, because if other bees are near they are apt to be attracted by it, and robbing is induced, especially if they are gathering but little honey.

II. Golden rule about stings:—Move gently, never dodge or strike at a bee, if stung never flinch, and remove the sting with a knife blade or thumb-nail pressed firmly against the flesh, dragging or rubbing it outward from the flesh.

Do not become excited or blow your breath upon them. In ordinary management one who does not flinch even when stung is not poisoned half so severely as one who does. The flinch of the manipulator is evidence to the bee that the sting is effective, but if he does not flinch, the bee, unless greatly excited, seems to conclude that it is ineffective, and immediately attempts, by working around and around to extricate itself without losing its sting, which is certain death. Often has the writer tempted bees to sting him and watch their efforts at extrication when convinced that they were mistaken because the sting caused no movement. A sudden effort to dislodge a bee will almost surely cause a severe sting.

Do not catch the bee and attempt to jerk it from the flesh, for in most instances, time is given to make the wound far severer than at first intended. Nerve yourself and do not flinch if stung. Thus the severest part of the thrust is avoided. The bee will at once attempt to extricate itself by crawling around and around. Never seize the sting between the thumb and finger to extract it. This mode of extracting squeezes all the poison from the poison-bag into the wound, and the effect is as great as possible. The poison runs slowly through the point of the sting into the wound, and if quickly pressed or rubbed outward from the flesh as described, but little poison is received. Pinch the wound, or press it with a hollow key so as to force out as much of the poison as possible. Apply some kind of an alkali to counteract the poison, such as soda (which should be kept wet for an hour), hartshorn or ammonia. An alkali is needed to counteract the poison. Try the remedies proposed and use that which seems to suit your case best. Soda, hartshorn or ammonia is best. One who attends to the foregoing suggestions will soon learn to care very little for stings. The practical apiarian soon learns to care but little for the sting. He learns to open his hives, even in the dead of winter, without fear, seldom receiving a sting and when received attended with little suffering.

RYE FLOUR FOR BEES.—Rye flour placed where bees can get it will supply them with pollen and induce breeding several weeks earlier than the first blossoms appear.

Floricultural.

IS IT A VULGAR TASTE?

LAST summer, among our few visitors was a lady (of education and refinement I judge) who, while walking about our grounds, asked—"Do you know what color I would paint those if they were mine?" She pointed to several rustic seats. I could not guess. "Red—a bright red," was the serious reply, Old Uncle DAILY, who was one of the little party, turning upon her a gaze that might have proceeded from a mild pity—possibly from an incipient alarm—at length laughed; and we all laughed except the lady herself who, as soon as she could be heard, earnestly sought to *prove* to us the propriety of her taste, though with but indifferent success. Seeing, however, that she was in real earnest, all listened respectfully, dissenting only by holding our peace.

Anxious as we were to avail ourselves of every suggestion in the improvement of our grounds—we yet rather inclined in this instance to heed the lesson taught the unfortunate artist who, having at infinite pains produced a speaking picture, thought to improve it by soliciting, and altering it in accordance with, the suggestions of every passer-by.

A few weeks after, during a ride—we were almost unconsciously admiring a portly, happy mansion surrounded by tidy, attractive grounds—when, reaching a front view, what should rivet my attention but a number of rustic settees and chairs, placed most comfortably—several upon the porch, several under the shade of trees—they were a bright red! What a coincidence! But though I laughed at our lady friend's *idea* of red rustic chairs, I laughed not at the realities but, [illegible]y enough, thought them precisely th[illegible] Was it a vulgar taste? I have a gre[illegible] hor[illegible]d RURAL, of being considered vulg[illegible] me, how shall I determine in aesthetic ma[illegible]s, what is refined, what is vulgar? Is there any book that tells? Some revile *white* houses because they look like ghosts. "Neutral tints" are said to be refined—that is, muddy colors—dusty, soiled colors—colors produced by spoiling bright lavenders, sky-blues, rosy-pinks and pea-greens. SOLOMON in all his glory was not arrayed as one of the lilies of the field. Was it a *white* lily referred to? Then SOLOMON would have looked like a ghost! Was it a red or a blue lily? Then SOLOMON would have looked vulgar! *Are* there any lilies of "neutral tints?"

What is there so unspeakably glorious about sunsets, that every poet must go crazy over, and youths in love so especially admire, but their fiery colors? Have poets vulgar tastes, and is love in this one respect demoralizing? Hyacinths, tulips, carnations, roses, camellias. Here we have the brightest shades of red, blue, yellow. Are they vulgar? And if so, how is it that ladies put them in their hair and imitations of them in their hats? Or is the same color which is "refined" in a lady's hair or on her hat vulgar on one's house?

Now, I want to paint my house, and I have a growing fancy for red or blue, or both. I do not like the "neutral tints," and *white* is ghostly. How am I to avoid both Scylla and Charybdis? Will you not confer the great favor of helping me? The more I think over it—the more I grow confused. In my perplexity, I called upon our country parson and stated my case: "Why," said he, after great patience in listening, "the only thing upon the face of the earth that is ever *vulgar* is the mind of man." But parsons—except they be such parsons as Mr. BEECHER—are rarely posted in the proprieties of refined life.

E. S. O.

FLORICULTURAL NOTES.

Humea Elegans.—We have already described this plant. The cut, from the spring catalogue of Messrs. E. G. HENDERSON & SON of London, unlike catalogue cuts generally, belittles the inflorescence which forms a "drooping pyramid of innumerable ruby-red, grass-like florets" four feet or more in hight. It is a half-hardy biennial, easy to raise from seed, and its silky panicles last from early summer until frost, though losing, late in the season, much of their brilliancy of color. It is, at least, worthy of a trial.

Invigorating Fluid for Plants.—4 ounces sulphate ammonia; 2 do. nitrate potassa; 1 do. white sugar; 1 pint hot water. Keep corked. One tablespoonful to a gallon of water, twice a week. We find the above written in the back of an old floricultural book in pencil. It strikes us rather favorably, but never having tried its effects we give it for what it is worth

Chimonanthus Fragrans.—The Gardener's Monthly says:—The buds are formed in the fall and grow larger with every warm winter's day. If these branches are cut off and placed in water in a warm room, they will expand in a few days, and fill the room with their delightful fragrance. A new branch so treated every week, will keep up a succession all winter.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

FORCING HARDY ORNAMENTAL PLANTS.

March 20.—There is such an endless variety of tender exotic plants in cultivation that one has no particular need of forcing hardy kinds with artificial heat. Still there are few species which are worth all it costs to force them into bloom at an unseasonable time, for we have really nothing else which exactly fills their place in the conservatory. Among the most desirable of all the easily managed and showy kinds which I have ever tried, the now common *Deutzia gracilis* and *Astilbe Japonica* are most satisfactory. That thousands of other persons also value these plants very highly is shown in the immense numbers sold by our florists every season.

Pots of these forced plants may be seen by the hundred in every one of our markets, all through the months of April and May, and there seem to be purchasers for all that are sent in for sale. I, for one, do not wonder at the demand for these beautiful plants, with their profusion of delicate little snow-white flowers, crowded upon graceful stems, each spike, or raceme, being a complete boquet in itself. The "Graceful Deutzia" is a low-growing, hardy shrub, seldom reaching more than two feet high, producing a number of small, slender stems in a clump, each springing from the base of the main one, or the roots, and no matter how short or slender the roots, they all produce flowers in abundance.

For the purpose of forcing, none but young plants are used, say those of one or two season's growth from cuttings, or old [illegible] which may be taken up and divided into as many divisions as there are stems. In the fall the plants designed for forcing may be taken up and heeled in, in some convenient place where they can be obtained when wanted. I usually put the desired number in my root cellar, which is cool enough to prevent growth, but does not freeze. About the first of February, or a little earlier, a few plants are brought into the greenhouse and potted, where they soon come into bloom. Other plants are brought out from time to time as wanted, in order to keep up a succession of flowers until those left out in the garden come on in their regular season.

The Japan *Astilbe*, sometimes called *Spiraea*, is an herbaceous plant with thick, fleshy roots, producing open, branching spikes a foot high, of pure white flowers, which, before they open, look like clusters of small seed pearls. The roots may be treated in the same manner as the Deutzias, and they bloom as freely when forced in the house. Both kinds are so readily propagated that our florists sell those taken from the garden for a little more than the cost of handling. Cheap and common as these plants are about our larger cities, I fear there are many persons in the country who have neither, but would be delighted to possess one or both.

For several weeks past I have been cutting sprigs of the Graceful Deutzia for table bouquets, and although it has long been a favorite of mine and occupied a prominent place in my garden and greenhouse, still as each season comes around it seems to have lost none of its beauty through long familiarity and association.

THE SPROUTING-LEAF PLANT.

March 21.—There is a singular looking plant in bloom in my greenhouse, which is known to florists and botanists as *Bryophyllum calycinum*. The name of the genus is from the Greek words for sprout or bud, and leaf, hence for the want of a better common name I call it the "sprouting-leaf," and the ease and rapidity with which it may be propagated from the leaves fully warrants the appellation.

A leaf thrown down upon moist soil, or cut up into sections and set edgeways in it, will soon produce numbers of small plants upon the upper edges. But it requires two or three years under ordinary greenhouse culture to produce a blooming plant, and then I think few persons would call the flowers handsome, although the habit of the plant is so graceful, with its hundred of pendant, shell-like blossoms, that one cannot fail to admire it. The specimen now in bloom in my greenhouse is growing in an 8-inch pot, and it has four flowering stems from 3 to 4 feet high, with at least 100 buds and fully-expanded blossoms on each. These flowering spikes showed themselves early in the winter, the lines appearing on short, lateral branches, and from the first they appear, like their shells, of a greenish color, spotted with brownish red. These buds are really nothing more than a globular calyx inclosing the embryo flowers which will appear later. The inflated calyx continues to slowly enlarge until fully an inch long and five-eighths of an inch in diameter; then from the lower end the reddish-brown petals of the tubular flower protrudes nearly or quite an inch more, the native bloom being a little more than two inches long. The leaves are of that thick, succulent character common to all of this family, and composed of from three to five pinnate leaflets. They are very brittle. Consequently plants set out in the garden, where exposed to winds, will soon be denuded of their foliage.

This Sprouting-Leaf is an excellent plant for the amateur propagator to begin with, for it will encourage him to attempt the multiplication of other kinds which are far more difficult to manage, besides it is a really showy thing and worthy of a place among a choice collection of window plants, as well as those of the more pretentious conservatory.

STARTING THE TUBEROSES.

March 22.—In our more Northern States the summer is rather too short for bringing tuberoses to perfection, and it is frequently the case that bulbs planted out in spring will scarcely commence blooming before they are cut off by the frosts of autumn. Now, to hasten the blooming and forward growth a few weeks, the bulbs should be placed under conditions which will excite the production of roots and leaves in advance of the regular planting season. This may be done in the kitchen or other warm room, if no better or more convenient place is at command. Shallow boxes filled with soil may be used for this purpose, the bulbs being put in close together and then watered occasionally as required. Other kinds of tender bulbs, such as the *Gladioli* and *Tigridia*, may be forced a little in the same way, if earliness of blooming is desired.

THE COLORADO POTATO BEETLE.

March 23.—Some of my neighbors call me a false prophet in regard to the potato beetle question, inasmuch as I asserted that the appearance of the Colorado pest would make potatoes scarce and high-priced in our markets. Last year these beetles made their first appearance in many localities in the Eastern States, doing but little damage on some farms and none whatever on others in the same neighborhood. The potato crop, upon the whole, was a large one, and the price in market has been very low during the entire winter, hence the cry that the potato beetle "don't amount to much after all." But they have come among us to *stay*, and the almost total neglect to destroy them last season in my own immediate neighborhood, as doubtless in many others, left a very numerous progeny to go into safe winter quarters and be ready for the first appearance of potatoes this spring. The resetting of fences and clearing up of old rubbish about the farm has already shown that the race still live and in numbers sufficient to show their power the coming season in reducing the potato crop. If our farmers think they are going to drive this pest out of their fields by a little leisure "whistling" at the "varmints," they will be most wofully mistaken, else I am no prophet.

Arboricultural.

BUYING vs. GROWING TREES.

There is little doubt that in thousands of families seeds of apple, pear and other fruits have been saved, and, either already in the ground or in some good place where their vitality will not be injured, will be planted out and ready to grow with the opening of warm, spring-like weather. There is a fascination about this business, and no doubt some valuable varieties are occasionally thus originated. In the great majority of cases, however, these seedlings are grown purposely to bud or graft, and in ninety-and-nine such cases out of one hundred the business does not pay.

If doing without fruit were the alternative to growing one's own trees, the case would be far different. As it is, the question is not fruit or no fruit, but only one of economy, with the advantage all in favor of purchasing fruit trees of nurserymen. Competition has reduced prices of nursery stock as low as they ought to be—lower than farmers can grow small quantities for taking the requisite care of the trees, grafting or budding, transplanting and other like items. The few farmers who have tried to grow small patches of nursery stock, expecting to sell what they did not need, have found that by the time the trees were old enough to transplant they had cost fully as much or more than it would take to replace them from the professional nurserymen. Such at least has been our experience and observation. In no branch of business is the importance of doing things largely greater than in growing nursery stock. Most of the work in the fields is done by horse labor in long, straight rows. Root grafting is done in winter by expert hands, who turn out ten times as many grafts per day as unskilled workmen could do. In every way the man who does a good deal of work has the advantage of him who does only a little.

Where the trees are designed for planting at home, the argument for buying as against growing is still stronger. In such cases *time* is an element of the first importance. Buying trees, grape-vines, currant and berry bushes means having the fruit one to five years earlier than growing from the seed. Often in this time more than enough fruit can be sold to pay the first cost, besides the immensely greater importance of having a supply for the family. There are hardships enough in a pioneer life; but doing without fruit, except partially, the first or second years, need not, and ought not to, be one of them. Fruit is so necessary to good health that its introduction should be one of the first duties in any distant settlement, instead of waiting till wealth made the purchase of trees easy. To wait for trees to grow from the seed is the next thing to postponing them indefinitely. Sometimes, however, by the mere purchase of cions to be grafted into wild fruit already found in the neighborhood, trees may be got in bearing very early and at a trifling expense. We are as anxious as any one can be that the people of new settlements should save in every way which does not mean doing without fruit. That is the loss of so much enjoyment, often of health itself, that economizing in fruit is to a certain extent robbing life of what makes it best worth living.

DWARF FRUIT TREES FOR GARDENS.

Standard fruit trees with their lowermost branches springing from the stems several feet from the ground may be preferable in an orchard, but we still prefer the dwarfs, or at least low-headed trees for the garden. In fact, the older we grow the less inclined are we to climb or risk our neck on ladders in gathering fruit. It is quite likely that in times past when dwarf pears were all the rage, that the mania for these trees led to some extravagant notions in regard to their productiveness and value, still we are not inclined to give them up, nor to think that all kinds of dwarf trees are a "humbug and delusion," as some horticultural writers have assumed to believe.

Our best specimens of pears of various sorts are annually gathered from pear trees worked on quince stocks, or what are termed dwarfs. But if we were about to plant a pear orchard of considerable extent we should probably select standard trees for the purpose, as they require less care and attention, and are perhaps less liable to disease. We think, however, that the failures experienced by many who went into the dwarf pear and apple tree culture, a few years since, with extravagant ideas in regard to profits, have led our pomologists generally to discourage the propagation and cultivation of dwarf trees of all kinds. There is, without doubt, some choice in the kinds of stocks to be employed in propagating dwarf trees, and only the best should be used; but let us not give up the low-headed dwarf trees, at least for garden culture. We want trees with branches starting near the ground, so that old folks and children can gather fruit without having to climb forty-foot ladders. If it is necessary to protect such trees from late frosts in spring, it is much easier to do so than with lofty specimens. The same is true in regard to destroying noxious insects, pruning and various other operations, which are sometimes necessary to insure a good crop of fruit.

It is well known that dwarf trees generally come into bearing much sooner than standard, and this saving of time is quite an important matter when a family has to wait for fruit until the trees grow from bud or cion to a bearing size. Trees trained low will usually come into bearing earlier than those trimmed up, even on the same kind of stock, and the only real advantage of using a dwarf kind of plant for a stock, is to save the trouble of checking by artificial operations, such as pruning and pinching back the young shoots in summer. Those who desire these low-headed trees have only to purchase one or two year old plants at the nurseries, and force the branches to push out low down on the main stem, and from that time forward avoid trimming up; but, instead, annually shorten all leading or terminal shoots. In many localities it is difficult to obtain large pears and apples from standard or tall trees, as they are likely to be blown off by the wind before mature, but with low-headed or dwarf trees this loss is avoided.

BUDDING PEACH TREES.

S. B. V.—Our nurserymen seldom propagate peach trees by grafting, as budding in summer is altogether preferable, not only for the peach but other stone fruits. Your inquiry "how to bud or graft one-year old peach trees," leads us to think that you have lost one year in time, by omitting to bud the stocks last fall, or when four to six months old, as is usually done by those who know just how to propagate peach trees.

Peach stones, properly wintered over, and planted in the spring in rich soil, will generally produce stocks large enough for budding by the first of August, or September at the latest, at which the operation should be performed, the inserted bud uniting with the stock, but remaining in a dormant state until the following spring. Now, if you have delayed this very important operation, and have the one-year old stocks on hand, they can be budded next fall, but one season's growth is lost, and the budding will have to be performed with more care to insure success than if it had been done last fall.

The stocks might be grafted this spring, but we would not advise you to attempt it, as it requires the skill of an expert to successfully graft the peach, especially in the northern states. Give the stocks good culture, pruning off a few of the lowermost branches if there are any near the ground. Later in the season, or when our readers begin to think about budding, we will give proper and full directions in regard to performing the operations. Should we do so now, one-half or more of our readers would have mislaid the article before they wanted to put the information it contained into practical use.

Pomological.

PEACHES.

Can any one of the editors or readers of the Rural give any information concerning these three new peaches, viz.:—the Alexander, Amsden's June and the Early Beatrice, and also tell us which would be most likely to succeed in Eastern Massachusetts?

Hale's Early is generally pronounced a failure here—it rots so badly. A good early peach as hardy and productive as the Crawford or Rareripe is greatly to be desired in this climate.

I have a number of peach trees set on a light, gravelly hill, not one of which the past three or four exceptionally severe winters has injured in the least, while Kittatinny blackberries, Rogers' grapes of different numbers, also the Walter, Croton, Senasqua and other new grapes were killed, root and branch, in the same grounds. I feel encouraged to set more peaches, and for that reason make the above inquiry. I think our Eastern farmers, who are near the best markets in the country, would find it profitable to devote more attention to this excellent fruit, which used to be so abundant in this section only a few years ago.

High lands, not over rich, but moderately fertilized with wood ashes or sulphate of potassa, with perhaps a little nitrogenous manure, I believe might be utilized as peach orchards. Almost every farmer has such spots, useless and unremunerative for grass or tillage, which, with a small outlay and intelligent supervision, might be made to yield a handsome return.

The yellows are not so troublesome as a few years ago, and, from my own limited experience with this tree, I see no reason why we cannot again raise this delicious and healthful fruit in New England as abundantly and more profitably than ever before.—P., *Brockton, Mass.*

At the winter meeting of the Western N. Y. Horticultural Society Mr. Ellwanger, who is excellent authority, spoke very favorably of the Early Beatrice peach, which, with the Early Louise, he called the earliest peach known. The Alexander and Amsden's June are American peaches, very early, but their character is not fully established.

There is no doubt that well-ripened peach wood will endure much colder weather than is generally supposed. Very often on rich soil, and especially where manure has been largely used, the growth of peach trees is watery and immature. Such wood will be destroyed by a moderate degree of cold. We suspect, also, that the reason for the killing of the grapes our correspondent mentions may be found in over-bearing and leaf blight, which prevented the vines of the current season's growth from ripening. Well-ripened wood is the best protection against severe cold. Vines which blight in summer will be quite apt to winter-kill during the following winter.

A SUCCESSFUL ORCHARD.

S. C. Davis of Orleans County, N. Y., has 90 acres in orchard, containing 2,500 apple trees, 500 of which were set in 1858, and the remainder in 1862 and 1868. The young orchards cover 55 acres, and are chiefly composed of the Baldwin, Rhode Island, Greening, and Roxbury Russet, with some autumn apples. He has besides these 2,700 trees or bushes of the Orange Quince, covering 10 acres, and planted six and ten years ago. The crops from these quinces the last two seasons were 50 and 53 barrels. Besides these, there are 2,000 peach trees, 350 planted in 1858, the rest in 1865 and 1868. The first 350 have yielded in all years over $4,000. There are also 2,000 standard pear trees, 1,000 of which are Bartletts. From the first planted (100 in 1864) 100 barrels have been picked.

Domestic Economy.

CONDOLENCE FROM THE KITCHEN.

GINGER SNAPS AND COOKIES.

"M. L. S." DEAR LITTLE WOMAN:—I know of course you are a woman, or you never would have paraded your grievances about ginger cookies so trustingly before the public, as you did in the RURAL of Feb. 19th. Whether you are little or big I do *not* know, but I call you "little"; because—because—well, because I'm a woman too, and feel sory for you, (not on account of your being a woman, but because you can't make ginger cookies). I do think it is a real misfortune to be particularly fond of some certain dish, and not be able to go to work and "get up" that dish in appetizing order. Now, if you'll promise never to tell, I'll tell you something. I love potpie—old-fashioned potpie, such as my mother used to make when I was a little girl. I love it, just as well as I did then, but, alack and alas! I can't make it. What light, tender, huffy crust, that belongs to the potpie I like, never emerges from the recesses of my dinner pot. Never? Yes, once I *did* make a mistake, and was actually complimented upon my "splendid potpie." I felt rather guilty as I quietly accepted the praise, for I didn't know and couldn't have told how it came to be so good; and I have tried and tried, since then, to make the same mistake, but I can't make it. My pieces of potpie crust would do very well to scare chickens off the garden with, but for grown up mortals without wings I consider them too solid a diet.

Now, how shall I get back to those cookies, again? I suppose I must proceed very gingerly, or our good Editor, though I'm sure he likes spice, will tire of seeing them in print. But he surely cannot blame us if we young housekeepers who know a little something about cooking, would like to know MOORE. To say the least, the subject is a sweet one (the cookies, I mean), and I suppose to be good should be shortened. So I'll tell you at once my object in referring to your unfortunate trials in this department of cookery. I want to give you my recipe for

GINGER SNAPS, OR GINGER COOKIES.

Two cups of molasses, one cup and a-half of shortening, one tablespoonful ginger, one tablespoonful soda, enough sour milk to dissolve soda. Roll very thin and you have splendid ginger snaps, or, not rolled so thin, they will be nice cookies. Now another thing—I speak from experience. Before putting your cakes in the oven, just hold your hand inside a moment, and if it is ordinarily hot, hot enough to bake bread—*don't put in the cookies*. Wait and watch, until your oven gets hot, hotter, hottest, and when it arrives at the superlative degree, and not till then, dare to slide a tinfull into its dark depths. I have found this to make all the difference, and have had just such cakes as you describe, all because I was simple enough to bake them in a moderately hot oven. This secret of my recipe is, *bake quickly*. Try this, please, and see if the next time one chances to jump out of JOHN'S pocket, if half the youngsters in the church don't start after it, it will look so tempting;—and I'll warrant you the minister's mouth, itself, will water for a taste of it too, if he loves ginger cookies as well as you and I do.

HATTIE F. BELL.

TO COLOR BROWN.

A WRITER in the Maine Farmer gives this recipe for coloring brown:—Steep hot, but not boil, one-half bushel butternut bark, until the strength is out. Then steep the goods one hour and air; then put in and steep one-half hour and let them cool. Add one ounce copperas to the liquor and bring it to a boil. If not dark enough use more copperas. Various shades may be produced in this dye by varying the bark and copperas. One part butternut and one part walnut bark answers well for a brown. The above is for four pounds of goods.

Here is another recipe from the same paper: The scaly moss from rocks and ledges is a good material for coloring brown. Gather the moss and place it in a brass kettle or tin dish, upon which pour cold water, then let it boil on the stove three or four hours. Then skim out the moss, put in the goods, and boil until you have the requisite color. It will never fade.

SELECTED RECIPES.

Plain Family Paste.—Two pounds of flour, half a pound of butter, half a pound of lard; mix as directed for puff paste. This makes a very good paste for ordinary use.

Sago Pudding.—Two large spoonfuls of sago boiled in one quart of milk, the peel of a lemon, a little nutmeg; when cool add 4 eggs, and a little salt. Bake about one hour and a-half. Eat with sugar and cream.

German Potatoes.—Mashed potatoes well seasoned and plenty of cream. Make in little cakes an inch thick, (made some hours beforehand they are better), beat an egg and dip them in it; brown nicely on both sides.

Short Cake.—One cup porridge, one cup water, and one and a-half cups barley meal or wheat meal (Graham flour). Make into a cake not more than half an inch thick and bake fifteen or twenty minutes in a hot oven.

Ginger Snaps.—One pint of molasses, one cup of sugar, one cup of butter or lard, one tablespoonful of ginger and cloves each, one tablespoonful of cayenne pepper; flour enough to roll out very thin. Bake on flat tins.

Potato Puffs.—One pint of milk boiled, one-fourth pound of butter or lard, one tablespoonful of sugar, six good potatoes mashed hot, flour to make a thick batter. Let rise very light, then knead into soft dough, roll thin, put two together; let rise two hours and bake in hot oven.

Bread Balls.—Break the bread in small pieces, and moisten with milk or a little warm water, season with salt, pepper and nutmeg, adding a little fine sage or parsley and a small piece of butter, mix and form into small cakes or balls; roast with beef or chickens, or fry after meat in a skillet.

Butternut Cake.—Four eggs beaten separately; two cups sugar, one of butter, one cup butternut meats, one-half cup sweet milk, two and one-half cup flour (heaped), one teaspoonful soda, two of cream tartar. Rub the black scales off from the meats before putting them in the cake. Bake in two loaves.

Mock Cream.—Boil a pint and a-half of milk, sweeten and flavor to taste. Beat three eggs very light; add to them three heaping teaspoonfuls of flour, and a teaspoonful of salt. Stir this into the boiling milk. Spread this, when cold, between two layers of the cake as made for Washington pie, and you have a nice cream pie.

How to Use Argand Burners.—The flame of an Argand burner possesses the greatest intensity of light when the quantity of air is supplied at such a rate as to bring the flame just beyond the smoking point. When more air is supplied, the flame becomes more and more pale, bluish and less luminous, while with a great excess of air, it burns with almost no light, like a Bunsen burner.

Hygienic Information.

REMEDY IN DIPHTHERIA.

DR. HOPKINS, in The Physician and Pharmacist, strongly urges the employment of acid tannate of iron as a local remedy in diphtheria. It may be prepared, he says, by the addition of one ounce of the muriated tincture of iron to one of a strong solution of tannin, and applied by means of a brush to the diseased throat, or elsewhere as the case may be; or, what is perhaps a still better way, apply the muriated tincture of iron in full strength to the diseased part with a brush, wait a few moments, then apply the solution of tannin in the same way, this forming a union of the two at the point of disease, having at the same time the advantage of chemical action, if there be any. On examination a few hours after, the line of demarcation will be seen distinctly drawn by the discoloration of the diseased tissue, showing exactly the extent of the disease, the very thing desired; with a tendency to separation, which will go on rapidly, if the system be properly treated with a nourishing diet and tonic and stimulating remedies. Dr. Hopkins regards this remedy as "above all others."

TRANSFUSION OF BLOOD.

IN the Buffalo Medical College, Professor Mason performed an operation on the 6th of February, in illustration of the transfusion of blood. Two dogs were rendered insensible with ether. One end of a thin rubber tube, filled with bicarbonate of soda to keep the blood from coagulating, was then inserted into the carotid artery of the larger one, and the other end into the jugular vein of the smaller dog. The tube was securely fastened. A vein was opened elsewhere in the smaller dog and his blood drawn off until respiration ceased and the dog was to all intents and purposes dead. By the aid of an air-pump artificial respiration was kept up in the body and the blood turned on through the tube from dog No. 1. In a few minutes when about four ounces of blood had been transferred into the carcass of the dog he began to breathe. His respirations gradually returned and in a short time were nearly as strong as before the operation.

HYGIENIC NOTES.

To Cure Hoarseness.—When the voice is lost, as is sometimes the case, from the effects of a cold, a simple, pleasant remedy is furnished by beating up the white of one egg, adding the juice of one lemon, and sweetening with white sugar to the taste. Take a teaspoonful from time to time. It has been known to effectually cure the ailment.

Lemonade for Scarlet Fever.—An eminent physician of a Western city says he has cured ninety-nine out of every hundred cases of scarlet fever by giving the patient warm lemonade with gum arabic dissolved in it. A cloth wrung out in hot water and laid upon the stomach should be removed as rapidly as it becomes cool.

Remedy for Earache.—There is scarcely any ache to which children are subject, so bad to bear and difficult to cure, as the earache. But there is a remedy, never known to fail. Take a bit of cotton batting, put upon it a pinch of black pepper, gather it up and tie it, dip in sweet oil, and insert into the ear. Put a flannel bandage over the head to keep it warm. It will give immediate relief.

Cure for Diphtheria.—A correspondent of the Boston Journal writes that he has used the following remedy for diphtheria in a great many hard cases, and in not one has it failed to effect a cure. It is as follows:—Procure some pitch tar—not gas tar—put a little on a hot iron, invert tunnel over the smoke, and let the patient inhale as much as he can without strangling, for a few minutes, five or six times a day. During the intervals let the patient have small pieces of ice to keep as near the root of the tongue as possible.

Patrons of Husbandry.

AGRICULTURAL INTERESTS IN CONGRESS.

THE fact that Congressmen and Senators are giving increased attention to questions directly affecting the interests of farmers is due, in a great measure, to the influence of the Patrons of Husbandry. It is the organization of farmers which makes them powerful, and it is this which forces politicians to respect their wishes. Some of the Senatorial ways of attending to farmer's interests are awkward enough; but even then the politicians probably mean well, but err through natural and habitual stupidity. Thus the U. S. Senate has passed an utterly impracticable bill, authorizing the appointment of one commissioner to investigate insects injurious to farm crops, pay his own expenses and receive a salary of four thousand dollars per year. What the Senate expect from one man, devoting his time to so large a subject, it would be difficult to guess. His investigations would require much more laborious research than all the questions over which learned Senators puzzle themselves, and make long speeches to be distributed through the mails to their constituents. It is really funny; but Senator LOGAN, who opposed the bill, we presume, because he thought it too extravagant, remarked to some other Senators who favored it and are supposed to want the Presidency, "You are all in favor of farmers now."

We presume this idea is a true one, and as we are glad to have Senators and Congressmen anxious to favor farmers, it is important that they should go the right way to work. Such petty legislation as appointing one commissioner at a small salary to do work sufficient for a dozen or fifty men won't gain any body aught, except ridicule and contempt. If Senators want to really do one act which will give unbounded satisfaction, let them take the cheap postage bill as it passed Congress and adopt it without delay. Nobody but the stockholders of express companies could find fault with such an act as that.

WOMEN AND THE GRANGE.

"A MATRON" writes sensibly on this topic in the Patron's Helper of Iowa. She says: Many of our sisters, after reading the national constitution and by-laws, joined the Grange, that could never have been induced to join other secret societies, for the good reason that the Grange placed woman on an equality with her husband, father or brother, and she may advance as well as they, and I cannot see why our brothers now complain, when they knew the law before they joined as well as we.

You say, Bro. Jones, that the subordinate Granges elect the masters but not their wives. I cannot agree with you in that. They know when they vote for master they are also voting for his wife (if she be a matron) to be a delegate, and whose vote for right or against wrong is equal to the one her husband casts, and if they do not select the best-mated pair of delegates, who is to blame but themselves? "Whom God hath joined together let no man put asunder," and some of the sisters possess enough self-esteem to think it possible that a master may be chosen for his wife's qualifications, as best qualified to represent their Grange as *vice versa*.

If we want the the National Grange abolished let us be satisfied to wait until a majority of our subordinate members or Granges say so, the majority having the power to disgrace and ruin or honor and perpetuate our noble order.

If the majority believe woman was created solely for man's benefit, and her place always at home, they can soon have the subordinate Grange, *minus* women, by evading the law, and selecting for masters none but those, whose wives are not matrons, as is often done, or old bachelors, or widowers, or young men who are pledged not to marry while in office.

So you see the Grange has the power at the present, without changing the law, to leave us women out in the cold, or rather at home, to see that the boys, or hired hands, attend to the pigs, cows, sheep or horses, or, may be, to do most of it ourselves in order that our husbands shall go as delegates. But let me assure you, brothers, who enjoy leaving your wives at home, with your cares as well as their own, devolving upon them, they will not urge you so strongly, that you go, since they have tasted the sweets of equality. We would now feel it pretty hard to be left alone with so much to do, or worse, with unprincipled hands to oversee, and feel that it would be no more than justice that we, too, have rest for the body and food for the mind, which our husbands enjoy weekly, from home, while month after month passes that we are not off of the farm.

Could woman go with her husband she might improve, gain confidence in herself, and do much good in the end; but go alone is more than I would or could do, and I have had a trial of it and know of what I write. It is expecting too much of the sister delegates and will eventually rid the Granges of sisters, which some of our brothers consider a useless appendage to our Order, and I think some of them are working to that end, when they oppose "masters and their wives" as delegates. If our brothers will only have patience with our weaknesses, even if we are expensive now, I think they will find us apt scholars, and the expense of our tuition will be money bearing, hereafter, a large interest.

THE "SOVEREIGNS OF INDUSTRY."

THE growth of this Order in the United States, especially in New England, has been wonderful. In less than two years the Order comprises, in Massachusetts alone, 159 Subordinate Councils, with a membership of 15,000 persons—male and female. The objects of this Order, as has already been stated in these columns, is to accomplish for the mechanics and workingmen of the country, other than farmers, what the Patrons of Husbandry are doing for the agriculturist interest. As with the Patrons, women form an important and valuable feature in the order of S. of I. Experience has shown that their presence exerts a harmonizing and refining influence, strongly conducive to order and decorum. The number of co-operative stores under the management of the S. of I. in Massachusetts is now 65, with a capital of $50,000, and monthly sales reaching an average of $30,000.

FARM EXPERIMENTS IN THE GRANGE.

THE members of the Perry (Ga.) Grange have unanimously resolved that its members prepare and plant, each, one acre of land in wheat, this season; and the member reporting the best yield from his acre be entitled to and receive one bushel of wheat from each member of the Grange who may engage in said contest for the premium—each contestant to furnish the Grange with a description of his land, preparation, fertilization, kind of wheat sown, and all the particulars of cultivation. Also, as many as may incline to put in one acre of oats, subject to the same regulations and premium. Also, to raise one pig to the age of one year, and the one successful in raising the finest hog to receive a ham from each member. Every member of the Grange is considered as taking part in these contests, unless he notifies the Secretary of his declination.

GRANGE NEWS AND NOTES.

THE Order of Patrons of Husbandry has developed in this country more speakers and active parliamentaries than any school or combination of college ever started in any country. This fact shows what an educational power there is in the Order, if used to advantage.

THE Farmers' Friend says there is now a genuine Grange of genuine straight-up-and-down farmers in the city of Philadelphia. There are enough farmers within the city limits to compose two or three large Granges, as perhaps fifty square miles of the city are farming land. The Grange referred to is located in the rural portion of the city known as "Bustleton."

THERE are fifty-one Granges in Indiana which have saved their members on an average of $578.-50 to each Grange, and eighty-five others, $407.-25 to a Grange on an average, by making their purchases direct of manufacturers. Here we have a saving of $71,191.25 by only 136 of the 1,991 Granges in this State. We have no reliable information from the other, 1,857 Granges, but it is fair to presume that many of them have made large savings by direct dealing, and the whole amount would doubtless astonish the members themselves.

AMERICAN FLAX CULTURE.

TEN to fifteen years ago there was a partial revival of flax culture in this country, and the subject was somewhat extensively discussed by the Agricultural Press. The RURAL NEW-YORKER devoted special attention to the subject for awhile, and there was issued from its office, in 1864, "A Manual of Flax Culture and Manufacture, embracing full directions for Preparing the Ground, Sowing, Harvesting, &c.—Also, an Essay by a Western Man, on Hemp and Flax in the West: Modes of Culture, Preparation for Market, &c.; With Botanical Descriptions and Illustrations." Several thousand copies of this Manual (a 25-cent pamphlet) were sold at the time (we have one of the sixth-thousand edition before us), but soon after the close of the war the matter seemed to attract less attention, and flax culture has since been conducted on a comparatively small scale, and confined to limited localities.

The subject of flax culture is recurred to now in consequence of a recent conference in this city concerning it, which developed some facts relative to the importation of Russian flax, and the inducements for American farmers to engage in flax growing. We subjoin a report of this conference substantially as given in the Tribune daily newspaper, believing the facts stated will prove of special interest to many of our readers:

Messrs. MILLER and FLEMING of Dundee, Scotland, the former one of the largest flax spinners of that city, and the latter extensively engaged in the importation of Russian flax, recently met PETER COOPER and other gentlemen interested in the subject of American flax culture. Specimens of flax, hemp, jute and ramie grown in this country were examined by Messrs. MILLER and FLEMING, and pronounced to be of excellent quality, equal to the best Russian fiber. Mr. MILLER said that he could annually use in his business $1,000,000 worth of American flax of the quality exhibited. Mr. COOPER introduced Mr. WATSON, who has made the subject of flax-growing and manufacture a study for 20 years. Mr. WATSON submitted comparative statistics showing the rapid gains the United States had made over Russia in the exportation of wheat in the past few years. In fifteen years (1858—72) the United States shipped to England 27 per cent. of the wheat importation of that country, and Russia 24 per cent. In nine months of 1874 the United States supplied Great Britain with 58 per cent. of her wheat and Russia only 11 per cent. The same land that yields wheat will yield flax and hemp; and as this country has surpassed Russia in wheat growing, Mr. WATSON declares she can also surpass her in the exportation of flax. Yet this country annually imports from Russia $50,000,000 worth of flax and hemp, which could be raised on American soil!

That flax is the most profitable crop for the farmer is shown, Mr. WATSON says, by our agricultural statistics. For example, in Morrow Co., Ohio, flax yields $27.08 per acre; wheat, $14.51; oats, $10.37; corn, $11.41, and in all soils adapted to flax, from Minnesota to the Gulf, it was the most profitable crop raised. Prepared flax sells freely in the New York market at about $300 per ton, and a leading importer in this city states that when he can obtain Western flax in the quantities which he wants he will cease importing from Russia. With the new machinery—the flax-puller and decorticator for preparing flax—Mr. WATSON believes a revolution will be effected in the business, and that the machines will do for flax growing what the reaper has done for the grain trade of America. He confidently expects that when the culture and value of flax are understood by American farmers, they will successfully compete with Russia.

Mr. COOPER, who has also given the subject much attention for a number of years, and particularly the improvement of flax machinery, fully supported Mr. WATSON's views, and has great faith in the future development of this industry. Mr. MILLER expressed much interest in the statement made, and was convinced from his investigations that American flax, in the not distant future, would become a leading staple of foreign importation.

THE CENTENNIAL DAIRY RING, AGAIN.

THE exposure of the "Centennial Dairy Ring" in a recent number of the RURAL NEW-YORKER, has called down a long array of personalities and false statements in regard to the Dairy Editor of this paper, and in this way an attempt is made to answer the facts in the case. The Husbandman has an article entitled "Prof. ARNOLD and Prof. WILLARD," in which the *ridiculous* statement is made that the exposure of this attempted fraud upon dairymen has grown out of our jealousy of Mr. ARNOLD. This same argument, we now learn from J. H. REALL's version of the affair, was used by the Ring to influence the Committee of the Whole at the Philadelphia meeting, Feb. 23d.

The Rural Home (Mr. ARNOLD's organ) also renews its charge of *jealousy* in a long personal attack upon us. Now let us see what the facts are in regard to this matter. We have always been friendly to Mr. ARNOLD, and have labored for his advancement in various ways. Years ago, when he was a resident of Herkimer County and when he aspired to political honors, we spent many days in riding over Herkimer County hills to secure position for him. We were upon the Committee that gave him the prize on his first dairy paper of importance, and we urged his claims, believing honestly that his paper was best, though others thought differently. At a later day we urged and were instrumental in securing his appointment as Secretary of the American Dairymen's Association—an association which we helped to organize and for years labored to put upon a successful footing, but which Mr. ARNOLD only at a late day became connected with. And in many instances we have recommended Mr. ARNOLD and secured his appointment as a speaker before various dairy associations. Indeed, until this trickery in Centennial dairy matters we have never laid a straw in Mr. ARNOLD's path, as the Rural Home and Husbandman well know. The charge therefore which is now trumped up of jealousy, is simply ridiculous and maliciously false. It is only brought up to bias public opinion and turn attention away from the real facts in the case.

We do not propose to go over the several points in this Centennial affair. The statement made in the exposure is simply the fact. And it is not alone our view, but that of other members of the Committee. For our part we could not have dairymen misled in this matter. We are for upright, square work, and we can indorse no other.

We are opposed to Mr. ARNOLD as a Juror of Dairy products at the Centennial, believing him to be quite incompetent for the place. Factorymen and dealers everywhere express the opinion that none but a practical expert—one who is dealing constantly in dairy goods and who is well acquainted with foreign and home demand—is alone capable of taking this place. We have no ax to grind in this affair and have only sought the public good. Dairymen of late years have become disgusted with the manner in which Town, County and State Fairs have been conducted as to awards, and many have refused to exhibit. The Dairy display at the Centennial is to be no town show, but a great National Exhibition, and to discriminate between the qualities of cheese exhibited by 2,000 factories requires the best expert in this country, which we are certain Mr. ARNOLD is not.

We claim the right to an opinion as to the qualifications of men seeking important positions without asking the advice of the Rural Home. If the Editor of that paper desires to controvert the statements concerning the Dairy Ring, why does he not call out a statement from Mr. O. S. BLISS of Vermont, the Secretary of the Centennial Dairy Committee? Mr. BLISS is honest and straightforward. He has the record of the doings of the Committee, and if called upon can tell the whole story as it is. The Rural Home talks about gentlemanly journalism. If the low personalities and false statements dished out by its Editor be a sample of gentlemanly journalism, we have misapprehended the characteristics of a gentleman and of decent journalism.

We entered upon this work of a grand dairy display at the Centennial with "clean hands," and we shall keep them clean. We do not propose to see the dairymen cheated out of fair awards without protest, and we are not to be browbeaten by malicious personal invective. If the exposure of this affair shall break up all future attempt at running the dairy display in the interest of a few persons—which we have faith it will—great good will be accomplished, and the Centennial dairy display will be an honor to the Nation. We shall work heartily to this end, as we have from the beginning.—X. A. W.

ANXIETY OF MR. ARNOLD'S ORGAN.

THE proposal to appoint Mr. ARNOLD as one of the Jurors at the Centennial Exposition has aroused considerable feeling among dairymen, and especially in the West where his lack of practical qualifications for the position is well known. Many Western dairymen say they will not compete, as, aside from the ring business, they do not consider Mr. A. competent to act as expert in judging of dairy products. All this is intelligible; but the sudden anxiety of a Western New York hebdomadal to prop up Mr. ARNOLD's reputation is not so easily seen through. We will explain it by a little story.

A well-known Boston chemist says that many years ago a rough looking man came into his office, sat down and deliberately began to unroll a package. One paper after another was removed, and at last the man's eyes glistened as he saw some sparkling substance, which he eagerly thrust forward with the query: "What is that?" The chemist saw at once that the glittering particles were *not* gold. "That," said he, "is iron pyrites." "Well! what is it worth. Is it good for anything?" followed in quick succession. "It isn't worth two cents a ton," said the chemist very solemnly. The man's lower jaw fell several inches, the package dropped from his hand and he looked as if he would very much like to faint. "What a confounded big fool I have been! Why, Doctor, there's a woman in our town who has a whole farm full of that ere stuff, *and I've gone and married her!*"

If this story doesn't point its own moral, it need only be added that the publisher of the paper aforesaid has invested a good deal more money in "Prof. ARNOLD" than he can well afford, and both he and his numerous friends are now very much concerned lest he shouldn't get his investment again. If Mr. ARNOLD should prove no better than that "whole farm full" of iron pyrites, the consequences might be very sad indeed. The story is a very suggestive one.

RURAL NOTES AND QUERIES.

Patrons and the Centennial.—It turns out that the arrangements inaugurated by the Patrons of Husbandry for their Centennial Encampment will furnish almost the only plan yet proposed for visiting the great Exposition with any degree of economy or comfort. The rates to and from the grounds—only 15 cents both ways—or ten cents one way, are much lower than any other arrangement proposes, and the charge of 50 cents for lodging and 50 cents for each meal is fully fifty per cent. cheaper than that proposed in the city. A Philadelphia correspondent of the Times writes: The Grangers may have hay-seed in their locks, but they certainly have brains under their hair. When the Grangers of Pennsylvania met in solemn State Convention and discussed the question of accommodation and prices within the city, they came to the conclusion that things were likely to be dearer than would suit either the pockets or the wishes of a true agriculturist. It may be observed that the farmer in all lands holds on to his money with an exceedingly hard grip, because he really earns it by the sweat of his brow.

The State Grange.—Sec'y ARMSTRONG sends us a neatly-printed pamphlet containing report of proceedings at the third annual session of the N. Y. State Grange of Patrons of Husbandry held at Auburn on the 11th, 12th, 13th and 14th of January last. The statistics show the Order to be in excellent condition, numbering 375 Granges, and the number is steadily increasing. At the close of the book is a list of Granges, with numbers, names and addresses of Masters and Secretaries, and the time of meeting. Among the officers of the subordinate Granges we recognize many of the leading agriculturists of their respective localities, and this feature of the report is especially interesting. The pamphlet is a creditable piece of workmanship, and was printed at the office of the Husbandman, Elmira.

Perquisites in a New Place.—The people of Albany County, N. Y., are showing some queer transactions incident to the General Term of the Supreme Court. During the last five years this Court has only sat 186 days, or less than 38 days per year; but, according to the bills paid, it used envelopes at the rate of 500 per day, and about two tons of white paper for decisions, notes, etc. A barrel and a half of writing fluid and a keg of carmine were used, or at least paid for, also 180 dozens of black lead pencils and 27 dozens of red and blue pencils. The bill for stationery, etc., amounts to $5,270.90, and shows on its face that somebody has enjoyed great freedom in dealing with the people's money. Luckily our Supreme Court judges are elective and can be reached.

The Glut of Silver.—Our suspension of specie payments has obscured the fact that in most parts of the civilized world silver coin has become superabundant, and is only received at a discount. According to the general prices, the U. S. silver coin is now worth, in gold, only eighty-three cents on the dollar, which is several cents less than legal tenders have averaged the past year. If we could be satisfied with silver a return to specie payments might easily be effected. This, however, would place us at the same disadvantage as now in our trade with foreign countries, which adopt the gold standard of currency.

RURAL BREVITIES.

WHEAT is higher in all the markets of Europe.

ANGORA goats are rapidly multiplying in California.

THE sorghum product of Georgia is increasing. A good sign.

THREE Counties of Ohio produced 769,000 bushels of potatoes last season.

BROOM manufacturing has begun in Nebraska, to use up the crop grown last season.

IN London last December a collection of orchids consisting of 659 lots, was sold at auction for more than $11,000.

A HORSE has been cured of heaves by sending him South this winter. Who knows but this may become fashionable for horses?

Two thousand three hundred and sixty-two dollars were paid last year on account of sheep-killing dogs in one county in New Jersey.

A YOUNG lady of Marshall Co., Ind., with the aid of a younger brother, works a farm of 80 acres, and is the main dependence of the family.

OF clover seed, the shipments from Philadelphia to foreign ports this season are only 1,500 bags, against 6,000 bags at the same time last year.

IF exhibitors of Dairy products at the Centennial desire honest awards and an equal chance, now is the time to break up the *Centennial Dairy Ring*.

ROBERT C. REEVES, dealer in garden, field and flower seeds, 185 Water St., New York, sends us descriptive catalogue for 1876. It is an interesting pamphlet, and will be sent on application.

OVER 197,000 trees were planted in Minnesota during the tree-planting season of 1875, by contestants of certain premiums which had been offered to those planting the largest number.

A VERY serviceable black horse, forty-two years old, died in Keene, N. H., a few days ago. He had been worked constantly until within a year and a half, when he was put on the retired list and kindly treated, being kept on porridge of scalded meal.

DAIRYMEN, don't desert the Centennial Exhibition, but break up the *Centennial Dairy Ring* and secure honest awards with an equal chance to all, instead of judgment for the favored few who captured the Committee by "surprise in the night."

L. L. CROCKER of Buffalo sends us Spring Circular of his brands of superphosphate, guaranteed to be equal to the analysis. We have so often recommended the use of these fertilizers that we need only call attention to Mr. CROCKER's advertisement in this paper.

IF the various papers which are endeavoring to sustain the *Centennial Dairy Ring* want proof that ARNOLD voted to exclude other candidates from the appointment of Juror, and that, by his own vote, they were so excluded, let them call upon Mr. BLISS, the Secretary, for his record of the proceedings.

NEW JERSEY is a thriving State, but always a little dwarfed by being so close to New York. We are glad to note that it is to have a first-class monthly agricultural paper, the New Jersey Agriculturist, published at Brunswick, N. J. The price is only 50 cents a year, and the paper should be liberally sustained.

A BRITISH Empire Horse Supply Association has been formed in London with a capital of one million dollars to import horses from the United States. It is expected to buy horses here at an average price of £100, have a steamer which will carry 450 horses, make six round trips a year, and sell the horses in England at £250.

THE farmer who boasted that he wintered his horses on oat straw, "and the oats were not half threshed either," did not use an AULTMAN & TAYLOR Thresher. The famished rooster, pictured on our last page, and looking like the worst defeated party after a Presidential campaign, shows the kind of threshing they do. The grain saved from the stack is just so much more added to the granary and to the farmer's profits. Send to AULTMAN & TAYLOR for their circular of prices.

HALF-VOLUME REMINDERS.

A GOOD TIME FOR RURAL RECRUITING.

THE RURAL NEW-YORKER *this week enters upon a new half volume, and hence the present is a good time to add to its circulation and usefulness. Agent-Friends (to whom thanks for past efforts) are reminded that* NOW *is the season to increase lists, thus adding to their Premiums and at the same time augmenting the benefits of the* RURAL. *We trust they will continue recruiting therefore until every one in their respective localities who ought to take this journal becomes a subscriber. And will not subscribers generally—in fact all friendly readers—embrace this favorable opportunity to introduce the* RURAL *to the notice and support of neighbors and others interested in promoting the best interests of the industrial community?*

Note that Single and Club subscriptions, for either six months or a year, are respectfully solicited. New clubs may be formed to commence with April, and additions to present ones are always in order. Our liberal Premiums are continued, so that Agents and all persons making additions to our list will be rewarded for their efforts.

BUSINESS NOTICES.

Nellis' O. H. H. Fork and Patent Method for Mowing and Stacking Hay or Straw, will save the farmers its cost every season. Wanted Agents who can give reliable reference. Pamphlet free. Address A. J. NELLIS & CO., Pittsburgh, Pa.

THE **"Phœnix" brand Pure White Lead** is corroded by the only true method, known as the "*Old* Dutch Process," and is sold with the positive assurance of absolute purity.

Tested by Time.—For Throat Diseases, Colds and Coughs, "*Brown's Bronchial Troches*" have *proved* their efficacy by a test of many years.

GREETING TO A TRIED FRIEND.

BY F. M'MASTER.

My faithful friend, thy counsels wise
Hath taught us how to learn
Our daily task, this side the skies,
In household, field and barn.

Since first we met, two short decades,
Life's best that I may see,
Have passed and bore me to the shades
That fall round forty-three.

Week after week, year after year,
Through Winter's storm and sun,
The RURAL's always present here
Before the week is done.

Justice and Truth hath been thy base,
On which alone can stand,
Throughout these wondrous latter days,
A people or a land.

Be thine a bright Centennial wreath
In days that yet may be,
Untouch'd by sin's defiling breath—
Child of integrity.

When MOORE hath done his well-done task,
And pass'd to CHRIST'S reward,
Oh! is it too soon to ask
That some be raised to guard

These pages from defiling things,
As they have always been—
Till JESUS down from Heaven brings
His hosts to close the scene?

St. Mary's, Ont., Canada, March, 1876.

The Story-Teller.

FATE VERSUS DECEIT.

BY MRS. GEO. BARTLETT.

"'A MODEST MAN is the very soul of honor,' dear grandma used to say;—how I wish she could have known ARTHUR!" This was what FLORENCE SHERBURNE was thinking as she tripped up the stairway of her father's elegant house.

ARTHUR had just left. He had called to ask if he might send a carriage to take her that evening to Mrs. FORSTER'S reception; but FLORENCE was obliged to decline, because EDGAR LEFFERTS had invited her two days before. Why did it always happen so? She could not even carry the little bunch of rose buds ARTHUR had brought, because EDGAR had sent a bouquet; but she smiled to herself—her dress at least had been chosen according to ARTHUR'S taste. She had purchased a pink silk because he once had said pink was his favorite color.

"Pink, rosy red, love's own celestial hue."

"You quote MILTON."

"And my own taste also."

So FLORENCE chose this color. The reception was to be the most brilliant one of the season, and with every anticipation of pleasure Mr. SHERBURNE'S beautiful daughter arranged her toilet. She did not stop to peep into her heart, or to perceive that with every thought of pleasure ARTHUR CLAYTON was associated.

No one entered those elegant rooms that evening with a happier, gayer heart than FLORENCE, and perhaps none left it with the same sense of disappointment. She had been admired and sought, and she knew that EDGAR LEFFERTS wished to marry her; but why had ARTHUR spoken so little with her, and why had he left so early in the evening? This last question she asked EDGAR on the way home, and he had simply replied, he "had an engagement."

But on reaching home—what could have happened?—the servants were moving about in such a hushed but hasty way! "Miss FLORENCE, don't be frightened," said THOMAS, meeting her in the hall, "but Mr. SHERBURNE is taken ill." Yes, her father was lying unconscious, and the physician in attendance pronounced it apoplexy.

What a night of terrible anxiety followed! But the morning came, and found her father still breathing; he lived. For weeks his only child watched by his bedside; and every day EDGAR LEFFERTS called to inquire and offer his services, which FLORENCE, poor, helpless girl, was glad to accept.

And why did not ARTHUR come? Twice he called and left his card and then suddenly he went to Europe. And something was gone from FLORENCE SHERBURNE'S life. For long hours she sat by her father's bedside, and with her anxiety was mingled a sense of desolation.

Weeks passed, and Mr. SHERBURNE was slowly improving when the doctor urged a sea voyage. "A few months at Pau or at Madeira, will be of great advantage," he said. "And something is needed to bring back the roses to this little lady's cheeks," he added, looking at FLORENCE. And so a plan came to be made. Mrs. RUSH, the sister of EDGAR LEFFERTS, was going to Cintra. Mr. SHERBURNE, with his daughter and EDGAR, who had become quite necessary to the invalid, would form the party. EDGAR had asked for FLORENCE to become his wife; her father had urged his suit, and she, in a subdued, half-sorrowful way, had at last consented.

They went to Cintra—beautiful Cintra!—but its soft air and charming scenery gave no pleasure to FLORENCE. Her father was not recovering as she had hoped; often she wept in secret, and felt that her heart was shut up by itself, while she seemed surrounded by friends. But at the end of three months Mrs. RUSH wished to make a tour of the Continent, and was eager to make a display before leaving Cintra. So why not celebrate the wedding? She urged the point, and Mr. SHERBURNE was led to agree that it was best. The bridal trousseau was accordingly ordered from Paris, the day was fixed, and preparations were hastened.

The fortnight quickly passed, and the day before the wedding day had come. The weather was charming, the soft air beguiling one out, and Mr. SHERBURNE said, "My daughter, I should enjoy a drive this afternoon. Can you go?"

FLORENCE was soon ready. "Why," said Mrs. RUST, as they met in the hall, "you surely don't mean to do a thing so contrary to the rules of propriety?"

"Contrary, I know, to the rules of society,—but I shall go."

"My dear," said Mr. SHERBURNE, "this is the perfection of days—I shall enjoy the sea air;" and when they reached the shore, he proposed they should walk a little on the cliffs. Arm in arm they walked, the father thinking of the passing scene, the daughter striving to shut out thought. A jutting rock was just before, and turning it, a gentleman was seen standing on the beach. Mr. SHERBURNE fixed a steady gaze, but the heart of FLORENCE beat quickly.

"Why, my daughter, surely that is ARTHUR CLAYTON!"

"Yes, father."

"Why, ARTHUR, ARTHUR! who would have thought of meeting you here!" said Mr. SHERBURNE, stepping forward and extending his hand.

ARTHUR said he had arrived only that morning in the steamer; that he was certainly intending to do himself the pleasure of calling very soon.

"Well you are just in time—one day more and you would have been too late. Our wedding is to be to-morrow; but come early, for I am impatient to talk with you, and in the morning I feel much stronger."

At ten o'clock Mr. SHERBURNE sat alone in his room when ARTHUR came; it was two hours from the time appointed for the ceremony. He had come to Cintra for the express purpose of speaking with FLORENCE, not supposing the wedding to be so soon; but here he was, and now his heart failed him. It was all too late; it was but for him to look on and see her made the wife of EDGAR LEFFERTS. He tried to keep up a conversation, then he looked at his watch.

"The guests I suppose are assembling," remarked Mr. SHERBURNE. "My dear, dear child! I am glad she is to have a protector before I go." He gazed out the window with a dreamy, absent expression; a certain pallor ARTHUR noticed came upon his face, then tremblingly he raised his hand toward his head. "Oh, ARTHUR, I don't feel well; what can be the matter?"

The head suddenly drooped on one side and the breathing was heavy and difficult. ARTHUR hastily rang the bell and FLORENCE was soon brought. Mrs. RUSH came and some of the guests, and physicians were sent for. But in less than an hour Mr. SHERBURNE ceased to breathe. He was laid upon a bed, and his daughter threw herself upon her knees beside the dear, lifeless form. Her toilet had just been completed when she was called, and now the contrast of the white satin dress—the wreath and veil, with the tear-stained face and the bursting sobs,—was something piteous to see. Mrs. RUSH and EDGAR endeavored to comfort her, and at last ARTHUR led her to her own room.

The guests had all gone now, and the hush of death was upon the house. The day was closing. FLORENCE lay quietly on the couch where ARTHUR had placed her. After a while she opened her eyes and perceived he had come in; they were alone together.

"ARTHUR," she said, "don't leave me; be a brother to me and take me home to America."

"But, Miss SHERBURNE——"

"Call me FLORENCE, and tell me that you will not leave me."

"Indeed, I will not leave you if I have the right to protect you. FLORENCE," he continued after a pause, "I came to Cintra to ask of you one question, little thinking I was coming just of the time fixed for your marriage. Let me ask that question. It is not whether you love EDGAR LEFFERTS; but,—you recollect the reception at Mrs. FORSTER'S,—tell me, at that time were you engaged to marry him?"

"No, ARTHUR, I was not."

ARTHUR bowed his head on his hand and a deep sigh escaped him.

"Why do you ask? I remember that evening; how you scarcely spoke to me, and when I got home,——oh, ARTHUR, it was that night that papa was taken sick! And then you called, but you did not come in; and then—then you went away. And papa liked EDGAR, and urged me to marry him. What is the question you wish to ask?"

"I have asked it. That evening I was told that you had promised to marry him—that you were engaged to him. That was why I went away. For I loved you, FLORENCE; for a long time I had loved you; and I thought you cared for me."

"I did care for you, and—and—when you went away and did not ask me to marry you, I was disappointed."

"Oh, how I was deceived!—how miserably deceived," moaned ARTHUR.

There was a long silence. At last FLORENCE said, "ARTHUR, will you promise to take me home?"

"I am happy in making the promise."

Neither spoke again through the hours of the night. Wearied by her grief, FLORENCE at last fell asleep. ARTHUR sat in the window, thinking of the strange events of the last two days.

The bridal dress was never worn again; but at the end of a week a carriage drove up to the American chapel, and there ARTHUR was married to the bride he had so nearly lost. There was no wreath, no veil, no ornament,—but the plain gold ring was placed on a pale, thin hand, and the dress was a mourning traveling dress. Traces of tears were in the eyes of the bride, but a quiet look was there that seemed to say her happiness found repose in his love.

THE RECLAIMED.

THE only one in the house, a little child, knelt by her bedside praying, alone. Perhaps the experiences of ten years had laid their weight upon her young heart—she certainly was not older—and were it not for the impressions which sorrow always leaves upon its victims, she would have passed for a younger child. It was not a large house, for there were but three rooms in it and, besides herself, it had but one occupant. He was away—she knew not where, only that her fears told her he was where he ought not to be. She had prepared their frugal supper hours ago, and had waited anxiously and hopefully for the sound of her father's returning footsteps, but night crept on apace, and he came not to cheer the solitude or relieve the anxiety of his waiting child.

Tears had been falling from the bright blue eyes, dimming their luster, and sobs had burst from the roseate lips, telling her heart's agony; and now, near the middle of the night, the little one knelt, as her sainted mother taught her to do, and prayed for the absent one:

"Dear God, bless my poor, dear father. Make him good and holy as my dear, dead mother was. Keep him from drinking the wicked brandy any more, and make him love his little Mary as he used to."

This was the burden of her prayer. But how can we tell the expression of her weeping eyes and little hands raised imploringly to heaven in the earnestness of her petition? Her golden hair fell loosely down upon her shoulders, and it was a picture which made glad the angels who beheld it. They had seen the picture before, and the merciful Lord had seen it and heard the earnest petition of the blameless one.

Charles Ransom had been prosperous and well-to-do. He had begun life with bright prospects; and with a loving wife and interesting children, his home was one of the bright spots of earth. But sickness and death came and robbed him of his heart's jewels—of all but one—and left him desolate and disconsolate. Truly, he loved Mary, the one left him by a wise Providence; but his devotion to his wife had been so entire and absorbing—she had become so truly a part of his own existence—that when she was taken from him life seemed a dismal dungeon, and he could see no "silver lining" to the clouds which mantled his life's sky.

Despondency took possession of him, and, to drown the poignancy of his grief, he resorted to the wine cup, as many an unfortunate one has done before him, deluded with false hopes. Having once begun in this way, he soon went to excess. At first the piteous appeals of his child and the advice and warning of friends who loved him, seemed to have some restraining effect; but at length these gradually lost their power, and one by one his "friends" gave up his case as hopeless, and ceased striving with him, wrapping themselves in the mantle of their own fancied perfection and invincible powers to resist temptation, and resigned him to his fate.

There was but one who remained fast and firm, staunch and true to the work of his reformation, and that was his heaven-eyed, sunny-crowned Mary. She never faltered in her prayers or her entreaties. She heeded no repulse and was discouraged by no delay, but, with the simple faith of childhood she kept her eye fixed steadily on the boon she so fondly desired—the reformation of the one she held most dear on earth.

On this particular night, Charles Ransom had lingered as usual at the dram-shop, and, becoming intoxicated, was oblivious to his home, his waiting child, and everything but his thirst for liquor. This thirst it seemed impossible to quench. His money was all gone and, alas! he had reached, too, that other certain stage in the drunkard's life when his credit at the bar was also gone; yet he implored the landlord for more drink. With his tongue thick and his eyes rolling in an idiotic stare, he begged in vain for one more glass to satisfy his craving thirst. His pleadings at last made the virtuous landlord angry, and, with a terrible oath, he answered the poor inebriate that if he could not be still he would kick him out into the street.

This was the first time in his mad career that Charles Ransom had ever received such a threat, and, bewildered and stupid as he was, his native pride and self-respect began to be aroused. The bar-room was almost full of men, some of them his acquaintances, and to be rebuffed in this manner and before them, made the degradation doubly poignant.

He staggered to his feet and caught a chair, but ere his faltering arms could raise it high enough for the object at which he aimed, the infuriated dram-seller hurled a decanter with such unerring precision, that it felled the besotted man to the floor, with his head gashed and the blood oozing from it frightfully.

"Get out of my house, you vagabond!" cried the landlord as, not content with seeing his victim helpless on the floor, he applied kick after kick to his prostrate body. "Get out with your villainous carcass, I tell ye, and get off to your pauper hovel and your crying brat, and never put foot inside this door again or, by ——, I'll kill ye!"

This brutal speech sobered the drunken man almost as by magic and, with a bound which surprised the lookers-on and made them stand back, he rushed upon his assailant and strangled him until he cried, "Help, men, for the love of God! The fiend is murdering me!"

The infuriated man loosened his grasp and broke forth:

"Oh, yes, Bill Jackson, you thought I was killing you, because you know you richly deserve it, not only from me, but hundreds of others. You sold me drink and encouraged me to drink; you said it would not hurt me—that it would do me good, that it would drive sorrow from me and make me forget my griefs. You were the one who, when I said my temperament was one that could not stand much drink, told me there was no danger—that I should get used to it as yourself had done; and you lured me on, from one stage to another, until you got all my money; and now, when I have nothing and am poor, and degraded, and low, and sunken into the gutter where you have dragged me, you spurn me from your house, you kick and beat me and, worse than all, you call my child, whom, with all my degradation and sin, I love better than my life—you call my child a brawling brat! Curse you, Bill Jackson, for the ruin you have wrought. But I will go from your house; I will go home to my poor child, and may the good God, whom I have so grievously offended, give me the strength to resist the temptation ever to enter your house or any other liquor shop again as long as I have breath."

APRIL SHOWERS.

The penitent man was assisted to his home by some of his companions; and, upon entering the house, there they saw that frail, fair child, still kneeling on the bare floor by her little bed. She had fallen asleep in that position after praying long and earnestly for her absent father. But she awoke at their coming, and with a startled cry she ran to her father and asked what was the matter.

With her own hands she dressed his wound and, pressing her to his heart, he told her he would try not to drink any more.

"O, dear papa!" she cried, "I thought God would answer my prayer. I have prayed so much for you, and mamma used to teach me that my prayers would be heard and answered when God thought it was best. Oh, won't mamma be happy, up in heaven, to know that you won't drink any more? and little brother Jamie? And I know God will bless you, dear father, and make you strong."

"May he bless you, sweet child, and make me ever worthy of such a precious treasure. Oh, what a sinner I have been! May God be merciful unto me!"

There was little sleep in that house that night. Charles Ransom was thoroughly aroused from the torpor into which he had been plunged so long, and he marveled that he had ever fallen so low. He had been snatched as a brand from the burning, but not by his own efforts; the grace of God, so unweariedly invoked in his behalf by his praying child, had at last come to his rescue. He saw how near the gulf of destruction he had approached, and in this hour of penitence he resolved no longer to rely on his own strength but to seek the aid of divine grace to help him battle with sorrow and adversity, for he had seen that "vain was the help of man," and that human nature, unsustained and unrenewed by grace, was the veriest weakness.

Two happy days passed into months, the months into years, and we behold the reclaimed one a respected and honored member of society. The beautiful little home which he used to own, and which he had sacrificed in his insane passion for drink, he re-purchased; and Mary, the same devoted daughter to whose prayers he owed his salvation, now developed into a beautiful and gifted young lady of seventeen, trains the flowers and vines around their happy dwelling, and with her love and care and goodness makes it a home which the angels seem to watch over with peculiar guardianship, and in her prayers she never forgets to say:

"My God, I thank thee that he who was nigh unto everlasting destruction is, by thy mercy, restored, and he who was lost is found."—*R. R. Engle.*

A SINGULAR MEETING.

What strange events happen; what wonderful coincidences spring into being along the pathway of life of some persons! I have just learned of an eventful meeting between two soldiers of the Rebellion, which, with a recent meeting I had myself with an old acquaintance, I will give the readers of the *Express* as they came to me.

Among the various regiments recruited in Central New York, during the late war, was the 160th, which was sent to the Department of the Gulf, and attached to the army under the command of General Banks. This regiment took an active part in the operations against Port Hudson, and was one of the first to enter that place at the time of its surrender, July 9, 1863. It was one of the regiments of Weitzel's Brigade, and the following year took part in an expedition to Sabine Pass, between Louisiana and Texas, where a large amount of Confederate stores were destroyed. One of the companies belonging to the 160th was raised in Palmyra, N. Y., and among its members was Mr. O. S. Stevens, who served full time, was discharged at its disbandment, and is now a merchant at Palmyra.

A few days since Mr. Stevens had occasion to go to Hartford, Conn., and left home on the 5 P. M. train on the Central Railroad. After becoming well settled in one of the sleeping cars, he discovered a tall, sandy-complexioned man in the opposite section, who, though a perfect stranger, had a large Roman nose which Stevens thought he had seen before, but failing to recall any resemblance of such a face, he gave no attention to it until the train reached Syracuse, when a long arm reached across the aisle, and a brawny hand touched him on the shoulder, the stranger at the same time asking if they stopped there for supper. To this Stevens answered in the affirmative, telling him if he would go along he would show him where to get a good lunch. At that they passed out together, and after supper the stranger offered Stevens a cigar, and then went into the smoking car where the following conversation ensued:

"Well, stranger, I reckon you live somewhere in these parts?"

"Yes, I live in Palmyra," said Stevens.

"And I live way down in Texas. I was what you used to call a Johnny Reb during the war."

"Ah, what part of the South did you serve in?" asked Stevens.

Thrusting his long legs under the seat in front, and turning part way round, he said:

"I was at Port Hudson until your army nearly starved us out, and we had to surrender. After I was exchanged I was a Texas ranger, and finally got reconstructed."

"And you were a prisoner at Port Hudson? Do you remember seeing the 160th New York Volunteers there?" said Stevens.

"I think I do," said the Texan; "and if I'm not mistaken, that was the very regiment our boys first met."

"And do you remember trading canteens with one of them?"

"Yes, and I got a tin canteen with the initials O. S. S. on it!"

"And I got a wooden one with J. T. P. on it," said Stevens.

"That was mine," said the Texan; "my name is John T. Pond. By George! we have drank from the same canteen, old friend; give me your hand for life," and he brought a tremendous squeeze on Stevens' hand, which fairly brought the tears to his eyes.

If the conversation had been lively before it was doubly so then. Mr. Pond going into a full detail of his history before and after the war. He had left Connecticut twenty-two years ago, and had settled at Sabine Pass, and was part owner of a large mill, which Stevens' command had destroyed the year following the surrender of Port Hudson. He was now on his way to New Haven to visit a sister he had not seen in all these years. He said that he returned to Sabine after the war, rebuilt the mill, was successful, and now had secured a competence that enabled him once more to visit his friends in the North. Stevens gave him an accurate account of the destruction of his mill, the first he had ever obtained, and the two sat up and conversed the entire night, while the sleeping car conductor wondered why they did not return to occupy their berths. The next morning they parted at Hartford; and though their first meeting had been as enemies, they bid each other good-by with many regrets, such as the best of friends only know.—*Cor. of Rochester Express.*

NO MOTHER.

The other day, when a stern and dignified Judge ordered a prisoner to stand up and offer objections, if he had any, to being sentenced to prison for a long term of years, the prisoner rose and said:

"I never had a mother to shed tears over me!"

His words entered every heart in the court room. He was a rough, bad man, in the middle age of life, and he had been convicted of burglary, but every heart softened toward him as his lips uttered the words. He felt what he said, and tears rolled down his cheeks as he continued:

"If I had had a mother's love and a mother's tears—some one to plead with me and pray with me—I should not now be what I am!"

Ah! That's it! There is a power in a mother's love, in her tears, pleadings and prayers, whose influence is hardly to be realized. God pity the lad who has no home to go to—no mother to whom he can tell his troubles and his griefs—no mother to put her arms around his neck and beseech Heaven to keep him in right paths! There is no heart like a mother's. Her child may wound it again and again, yea, pierce it with a sword, and its last pulsations will still beat with love for the ingrate. It is the first to excuse his faults, the last to condemn. There is no love like a mother's—none so enduring, so tender, so far-reaching. It is lavished upon the child in the cradle, and it follows the boy over the ocean. It calls up the wanderer the first thing in the morning, and it remains with him until sleep closes the eyes. When a mother's love for her offspring dies out, it is a certain sign that he has become a being too atrocious to longer live among men.

There are no tears like a mother's. Nothing can so lighten the sorrow of a child—nothing so restrain a mind from wandering into evil paths. The man who looks back over his childhood and youth regrets nothing so much as that he has brought tears of sorrow and sadness to a fond mother's eyes. Every tear a mother sheds over a wayward child is recorded in the great book, and he shall answer for it.

There are no prayers like a mother's—none that reach so far, and none so earnest. The wanderer on foreign shores feels this in his heart, and he is thankful to Heaven that he can feel it. Kneeling at her bedside and asking the angel to guide the feet of her children in right paths, who doubts that a mother's prayers are heard in Heaven?

"I never had a mother to shed tears over me!"

The sorrowful words of that burglar might be the words of many evil doers. "No mother" means aching hearts, burdened minds, deadly woes, and paths which lead down to ruin. Heaven be kind to the lad who must battle through the world without a mother's tears, a mother's prayers, and a mother's boundless love to give him hope, strength and courage!"

ALWAYS DISAPPOINTED.

Did you ever see, far, far away from you, the beautiful purple mountains, and set forth to seek them, with a vague feeling that upon them the world must seem more beautiful, more romantic than it does upon the plain? But as you go on, though the roads are hilly and there is some climbing to be done, you discover that you never seem to reach those mountains—those wondrously beautiful mysteries that smile upon you from afar. You tread common earth and clamber over common rocks. The trees and bushes grow even less beautiful; they are stunted and rough; there is much that is troublesome in the path, and you cannot believe that you are higher above the earth than you were. Far away still lies the beauty and the mystery—far away, far away; and about you only mire, and dust, and stones, and common herbage. Even should you mount to some highest peak and look back, you would find the beauty in the valley you had left, not on the rugged mountain where you stood.

And so in life. Climb where you may, to whatever pinnacle, you never reach your beautiful mountain. Where you stand, another's eyes may be fixed now. To him it has the beauty, the mystery, the charm it once had to you. You have only proven to yourself that the beautiful mountains are yet farther away. And, alas! living feet never reach them, but must for ever press common earth.

Oh, the golden mountain of Wealth! Oh, the glorious mountain of Fame, purple as an Emperor's robe! what say those who stand upon them? Only this:—"They were hard to climb."

And that most beautiful and roseate mountain which two ascend hand in hand, after the wedding ring is on! Ah! well, there is rest and peace there often, when both hearts are true; but it is not what it seems to the boy and girl who yearn for it as they stand together in the sweet valley of first love.

We never reach our beautiful mountains. We never may. Yet they make the valley beautiful—and we would be worse than we are if we did not see them as we do; unhappier, if they did not arise in all their splendor above these stony, common paths of ours, to tell us what might be, if not what is.

FIRST STEAMBOAT ON THE HUDSON.

The steamboat itself is a romance of the Hudson. Its birth was on the waters, where the rude conceptions of Evans and Fitch on the Schuylkill and Delaware were perfected by Fulton and his successors. How strange is the story of its advent, growth and achievements! Living men remember when the idea of steam navigation was ridiculed. They remember, too, that when the Clermont went from New York to Albany without the use of sails, against wind and tide, in thirty-two hours, ridicule was changed into amazement. That voyage did more. It spread terror over the surface of the river, and created wide alarm along its borders. The steamboat was an awful revelation to the fishermen, the farmers, and the villagers. It came upon them unheralded. It seemed like a weird craft from Pluto's realm—a transfiguration of Charon's boat into a living fiend from the infernal regions. Its huge black pipe vomiting fire and smoke, the hoarse breathing of its engine, and the great splash of its uncovered paddle-wheels filled the imagination with all the dark pictures of goblins that romancers have invented since the foundation of the world. Some thought it was an unheard-of monster of the sea ravaging the fresh water; others regarded it as a herald of the final conflagration at the day of doom. Managers of river craft who saw it at night believed that the great red dragon of the Apocalypse was loose upon the waters. Some prayed for deliverance; some fled in terror to the shore and hid in the recesses of the rocks, and some crouched in mortal dread beneath their decks and abandoned their vessels and themselves to the mercy of the winds and waves or the jaws of the demon. The Clermont was the author of some of the most wonderful romances of the Hudson, and for years she was the victim and enmity of the fishermen, who believed that her noise and agitation of the waters would drive the shad and sturgeon from the river.

B. J. Lossing, *in Harper's for April.*

ASTOR'S CHILDREN.

Wm. B. Astor had a superior wife and she strove to do good among the poor, but there were difficulties in the way, as the public generally understood. They have two daughters, married to men of character, the names being Cary and Delano, and they live up town in handsome style. There are three sons—Henry, a weak-minded man who has been kept carefully out of the public gaze, William and John Jacob. The latter is a portly man of large build and has passed his fortieth year. He is heir apparent to the largest part of the estate, it being the intention of the old man to keep it unbroken as long as possible. Of William, the second son, so little has been heard that were it not for his expected wealth he would be merely one out of our million of inhabitants. Henry was kept for many years at the farm in Barrytown (between this city and Albany), and as he is mentally deficient it was intended to make that an asylum for him. He defeated these plans, however, by making a match with a country girl, who had no objection to hitch on to an opulent family, and the latter was taken by surprise at an event which shows how love laughs at capitalists. John Jacob married about twenty-five years ago, and the oldest son has just graduated at the law school. The object, no doubt, was to give him such an acquaintance with this profession as will enable him to manage the vast estate. Instead of setting up his sign and waiting for clients, he will have enough to do in that office which contains the deeds to forty acres in the most important city in America. To go back to the idea of the Centennial, what a difference between the young Astor of the present day and his ancestor who a hundred years ago was helping his father draw pork on the banks of the Rhine.

A CHECKERED CAREER.

There is a man in Taunton, Mass., now forty-six years old, who has had a checkered career. He has been shipwrecked once; narrowly escaped baking in a railroad accident; has been run away with times innumerable; was shot in the neck at Gettysburg; had a taste of Libby prison; fell overboard from a whaler, and, before being picked up, left two fingers in the mouth of a shark; was drafted twice; had his right arm broken in two places during the New York riot; stood on a barrel with a halter around his neck, in an Alabama town, at the outbreak of the rebellion, from sunrise to sunset; in 1863 was crushed under a falling building during a California earthquake, and was without food and drink nearly fifty hours, and, when homeward bound from the mines of the White Pine region, narrowly escaped lynching through a mistake in person. Amid all, he preserves his equanimity, and refuses to believe that luck is against him.

Sabbath Reading.

TRIBUTE TO THE LATE DR. HOWE.

The rest that earth denied is thine,—
Ah, is it rest? we ask,
Or, traced by knowledge more divine,
Some larger, nobler task?

Had fate those boundless fields of blue
One darkened sphere like this;
But what has Heaven for thee to do
In realms of perfect bliss?

No cloud to lift, no mind to clear,
No rugged path to smooth,
No struggling soul to help and cheer,
No mortal grief to sooth!

Enough; is there a world of love,
No more we ask to know;
The hand will guide thy ways above
That shaped thy task below.

[*April Atlantic.*

THE BIBLE.

There may be a few of our readers who are unacquainted with the following Biblical facts, consequently we insert them for their enlightenment: The Scriptures have been translated into 148 languages and dialects, of which 121 had, prior to the formation of the British and Foreign Bible Society, never appeared. Twenty-five of these languages existed without an oral form. Upward of 43,000,000 of these copies are circulated among not less than 600,000,000 of people.

The first division of the Divine order into chapters and verses is attributed to Stephen Langton, Archbishop of Canterbury, in the reign of King John, in the latter part of the twelfth or beginning of the thirteenth century. Cardinal Hugo, in the middle of the thirteenth century, divided the Old Testament into chapters as they stand in our translation. In 1661 Athias, a Jew of Amsterdam, divided the section of Hugo into verses. In 1561 a French printer divided the New Testament into verses as they now are.

The Old Testament contains 39 books, 929 chapters, 23,214 verses, 592,439 words, and 2,728,100 letters.

The New Testament contains 27 books, 270 chapters, 7,931 verses, 182,253 words, and 933,380 letters.

The entire Bible contains 66 books, 1,190 chapters, 31,174 verses, 753,692 words, and 3,565,480 letters.

The name of Jehovah, or Lord, occurs 6,855 times in the Old Testament.

The word "and" occurs in the Old Testament 35,543 times.

The middle book of the Old Testament is Proverbs.

The middle chapter is the 20th of Job.

The middle verse is in 2d Chronicles, 20th chapter, 17th verse.

The middle book of the New Testament is 2d Thessalonians.

The middle chapters are in Romans, 13th and 14th.

The middle verse is Acts 11: 17.

The middle chapter and the shortest in the Bible is Psalms 2: 17.

The middle verse in the Bible is Psalms 18: 9.

The least verse in the Old Testament is in 1st Chronicles, 1: 25.

The least verse in the Bible is John 11: 35.

The 19th chapter in 2d Kings and in Isaiah 37th are identical.

The 21st verse of the 7th chapter of Ezra contains all the letters of the alphabet, I and J being considered as one.

The Apocrypha (not inspired, but sometimes bound between the Old and New Testaments) has 14 books, 183 chapters, 15,081 verses, and 152,185 words.

The preceding facts were ascertained by a gentleman in 1778, also by an Englishman residing at Amsterdam in 1722, and it is said to have taken each gentleman nearly three years in the investigation.

There is a bible in the library of the University of Gottingen written on 2,470 palm leaves.

A shekel of gold was $8.09.

A talent of silver was $516.32.

A talent of gold was $18,800.

A piece of silver or a penny was 13 cents.

A farthing was 3 cents.

A gerhem was 1 cent.

A mite was 1½ cents.

A homer contains 75 gallons and 5 pints.

A hin was 1 gallon and 2 pints.

A firkin was 7 pints.

An omer was 6 pints.

The divisions of the Old Testament are four, as follows:

1. The Pentateuch, or the four books of Moses.

2. The historical books, comprising Joshua to Esther, inclusive.

3. Poetical and doctrinal books from Job to Songs of Solomon, inclusive.

4. Prophetical books from Isaiah to Malachi.

The New Testament is usually divided into three parts, viz.:

1. Historical, containing the four Gospels and Acts.

2. Doctrinal, comprising all the Epistles from Romans to Jude.

3. Prophetical, being the Book of Revelations of St. John.

The meanest principle is stubbornness. "If any one offends me I'll never forgive them," says one. Well, if you do not, you never enter Paradise, that's certain.

Ladies' Portfolio.

TWO LOVERS.

Two lovers by a moss-grown spring;
They leaned soft cheeks together there,
Mingled the dark and sunny hair,
And heard the wooing thrushes sing.
O budding time!
O love's best prime!

Two walked from the portal step;
The bells made happy carolings,
The air was soft as fanning wings,
White petals on the pathway slept.
O pure-eyed bride!
O tender pride!

Two faces o'er a cradle bent;
Two hands above the head were locked;
Those pressed each other while they rocked;
Those watched a life that love had sent.
Oh, solemn hour!
Oh, hidden power!

Two parents by the evening fire:
The red light fell about their knees
On heads that rose by slow degrees
Like buds upon the lily spire.
Oh, patient life!
Oh, tender strife!

The two still sat together there:
The red lights shone about their knees
But all the heads by slow degrees
Had gone and left that lonely pair.
O voyage fast!
O banished past!

The red lights shone upon the floor
And made the space between them wide;
They drew their chairs up side by side,
Their pale cheeks joined, and said, "Once more!"
O memories!
O past that is! [*George Eliot.*

IN THE GARDEN AGAIN.

Spring has come, I should say. At any rate the dear little bluebirds put in their appearance for the first time this year in this part of the universe this morning at daybreak, making one's heart leap for joy at the anticipation of another season of fruits and flowers. And these few nice days remind one of the preparations that need to be made to insure success the coming season in our gardens, both flower and vegetable. Now is the time to start the salvias, petunias, phloxes, potatoes, onions, etc., if we have not done so already. All will do well in boxes in our windows, if no other convenience is at hand, for early planting out. And we can soon start sweet corn on inverted sods. Place the sods in a box and fill in around with dirt or soil, and when the weather becomes settled transfer them carefully to the garden in hills prepared as usual, only deeper, with some warm horse manure in the hill, and the probability is you will have corn for the table some time before your neighbors.

We hope our lady readers are preparing themselves for some vigorous working in the garden this Spring and Summer, thereby gaining strength for the muscles by the gradual and daily use of them—not letting Pat or John do all the labor while we stand and look on, but take hold of the spade *once* or *twice* in a while ourselves, driving away indigestion and nervousness in all its horrid forms. There are few that have gained more than the writer of this by being often in the open air; once an invalid, now quite robust and strong. Then let us have fresh air constantly in our houses, especially in the sleeping apartments. Why, we have had visitors that would slam down the window sash to exclude the air from their rooms, as though they were in fear of the small-pox coming in at the window, and on getting into bed close the door tightly, and in the morning such a stench as proceeded from the room was enough to sicken even swine. But I fear I am digressing; excuse me, Mr. Editor. I hope there are none among the readers of the RURAL that are so ignorant of the laws of health.

And now let us put on our shoes with thick soles, go to the woods and gather moss and leaf mold for the potting of our plants next Fall for the house—adding some old cow manure and unleached ashes—place it convenient to receive all the slops from the chambers during the Summer—and people will wonder next winter why our plants bloom so well and why they are so free from insects.

As soon as the weather will permit plant out your little seedlings, preparing the ground yourself. Rake and remove all the rubbish from the yard some pleasant day. You see there is no use of *always* blaming the men folk for such a looking yard as we usually have, saying, "Our men folks never take time to do anything in the yard." Suppose you do what you can yourself, asking the "hired man" to assist you, if need be, when the "boss" is away for a few hours. (Oh, we have done such things; it makes us laugh, though, when we think of it.) The premises will soon assume quite a "slicked up" appearance, and if we only persevere in this out-door exercise, we shall soon be a much healthier class of women.

Catskill, March, 1876. BROWNIE.

KNOT HOLES.

I HAVE been sitting here, curled up in my chair, doing—nothing, people would say; but people would be mistaken, for I have been busy, very busy, watching and thinking.

What was I watching? I'll tell you. Just a little ray of Spring sunshine that was falling on the floor beside me, where all else was dark and somber. It came through a tiny knot hole in the shutter, and quivered and flickered, now bright, now gone entirely, as the branches danced across its path outside. After a little the sun went down behind the hill, and then there was nothing left but the knot hole, and that set me thinking. I remember just how it came there. I poked the knot one day to see if it was loose, and out it popped and left what I called an unsightly spot in the shutter. I am glad now that I punched it out for it has let so much sunlight into this dim old room. From this knot hole my thoughts went on to others. This whole day has been one grand knot hole, letting in sunlight and warm air enough to last through the stormy days that are sure to come before the Summer time is here.

How many knot holes there are in our lives that let in the light from the cheery outside world into our oftentimes weary hearts! We almost despair sometimes, yet, even though we doubt it, some one loves us, and that is the light and the smile or kind word they give us is the knot hole that the light creeps through. We could make knot holes for ourselves if we only would. Push out those rough, hard spots in our lives, and in will come the sunshine. It may not last long, but dance away as quickly as mine did to-day, yet we know it has been there and we feel that it will come again some day. We make the hole—that is our part of the work. God sends the sunshine, and that is His part of the work, and so it all comes out right. The way may be dark, but there is light outside and it will creep in if only we give it a chance. RUTH MORE.

Catskill, New York, 1876.

WOMEN PERSONALS.

MISS EVA ROSS-CHURCH, daughter of Mrs. Ross-Church (Florence Marryat), has recently made her debut on the stage in Edinburgh.

THE MISSES MULLER, Max Muller's two daughters, have passed successful examinations at Oxford in English, French and German.

MISS CELIA ELIZABETH HARRIS of Nebraska, a native of South Bend, Ind., leads the medical class of Boston University wich graduated recently.

MRS. AUSTIN G. BARNETT of West Stewartstown, has raised and sold $50 worth of canary birds since one year ago last June, all the progeny of one female bird. Besides these she has given away four and has four left.

ELIZABETH STUART PHELPS is a regular contributor to the Atlantic and the Independent. Her Florida Sketches have been read far and wide. They furnish a useful key to those who go there for health or to reside.

MRS. ANTOINETTE BROWN BLACKWELL is writing a book called "The Physical Basis of Immortality." It is to be offered to the ladies' department of the Centennial. The Putnams will also send the other works of Mrs. Blackwell.

MADAME SAND continues in the evening of her industrious life to publish novels as rapidly as in her prime, and it would seem that she has not lost her power to entertain the general public. "Flamarande" is but lately out, and it is already in a fifth edition.

LUCY LARCOM began to write verses at the age of seven. An amusing blunder occurred when one of her earliest pieces was published. The editor intended to say that they were written under the inspiration of the "muses," but the types made the word "nurses."

IDA LEWIS, the marine heroine, is poor, and plays every Monday morning on a seven and a quarter octave washboard. Yet people send her poems, silk hosiery, three-button gloves and fine jewelry. If any one wishes to send her anything let him send something substantial.

MRS. LUCY E. BURBECK of New London, Conn., widow of the Henry Burbeck who was a General in the Revolutionary war, is on the roll of the Pension Agency at Hartford, Conn. Mrs. Burbeck is ninety-four years old, but is still able to sign her name to the vouchers for the $150 which she receives quarterly.

MRS. THOMAS, widow of Major-Gen. George H. Thomas, publishes a letter denying the report that at the outbreak of the rebellion the General was a States-rights man and sought employment in the military service of Virginia. He was loyal to the United States, and never applied for service in the Southern army.

JENNIE JUNE writes—"Miss Alcott is lall, to the infinite surprise of many of her admirers, who get the impression that she is a very little person, from her books. But she is a good and thoroughly charming woman, utterly free from nonsense, shams, pretences, a quick and intelligent observer, kind, and even loving to children, who in turn soon learn to adore her."

MRS. A. M. WOOD, eldest daughter of the late President Zachary Taylor, died at Freiburg, Germany, on Dec. 2, aged sixty-five. She was the widow of Gen. B. C. Wood, U. S. A., and mother of Capt. John T. Wood, one of the most distinguished officers of the Confederate Navy. Her death leaves but two surviving children of Mr. Taylor—Mrs. R. T. Dandridge, Winchester, Va., and Gen. R. Taylor of Louisiana, ex-Confederate.

INQUIRY ABOUT THAT ROYAL STAND.—Will the lady that wrote such a pleasant article on "Out-Door Home Decorations" in RURAL of Feb. 26, tell how her Royal Stand is made? It has been a subject of dispute in our home. One member thought the wheel was placed on the cheese box, and another that the wheel laid on the ground. I should like to see her home; it must be beautiful.—RUTH WOOD, *Penn Yan, N. Y.*

Reading for the Young.

GRANDMA AND JO.

SHE has snow-white hair and a snow-white cap,
And a snow-white ruffle atop of that—
And Jo loves to climb on grandmamma's lap,
As she sits asleep in her easy chair;
For grandmamma never scolds nor says,
"Now run away, Jo," but softly she lays
Her shrunken hand on each glossy curl,
And whispers, "Grandmother's own little girl."

Grandma will never let Jo be whipped,
Cunning darling and rosy lipped,—
For grandmamma's heart is soft as the sun-
Ripened peaches when summer is done.
Mamma says—Grandmothers spoil children so:
But grandmamma sits in the golden glow
Of Heaven and cannot love whips, you know,
And that makes it very pleasant for Jo.

If grandmamma ever had any care
She has laid it down out of sight somewhere,
And now all she does is to say her prayer
And sit where the sunshine gilds her hair,
And play and whisper to little Jo
As the shadows of coloring come and go—

For grandmamma's feet are close to the shore
Of a river deep, where her friends before
Have crossed, and her dear beloved gone o'er—
And being so near to this shining shore
Of course she never weeps any more:
She knows that soon she shall see them all,
And she sometimes thinks she hears them call
Out of the chamber or sky or hall:

But she only kisses dear little Jo,
And whispers "Soon we shall know, little sweet,
How the City looks with the golden street,
And if our beloved will hasten to meet
Us who come up with travel-strained feet,—
There are CHARLIE and JACK, but you did not know
Any of them, sweet little Jo." A. E. M.

LETTERS FROM BOYS AND GIRLS.

From a Pennsylvania Girl.

COUSINS:—I stand waiting at the door for admittance! Will no one bid me enter? Thank you for at last admitting me! I have long wanted to be one of your number, but feared to try lest I should not be received into your charming circle. Now, I am going to try and write something for our dear, old RURAL. First, I'll tell you about my own interesting self. I, like another of our Cousins, have a good opinion of self, and why should not we girl-cousins have a right to our own opinions? We may not be as conceited as our boy-cousins, yet we may have (and justly) a good opinion of our own abilities. But I am digressing from my principal subject. I am a country lassie, and live in Pennsylvania. Of course you will all want to know my age; and I guess I'll enlighten you slightly on the subject. (But, by the way, let me ask a question just here. Why are the gents always so very curious to learn a young lady's age? Gent-cousins, that is one thing we of the gentler sex are not generally possessed with—an over-amount of curiosity regarding a person's age.) I have promised to tell you my age, so here goes: I am still in my teens, but will be out of them before next century. I am still young enough to attend common school. I am five feet two and one-half inches in hight, weigh one hundred pounds, have dark hair and eyes, skin the same shade, and am passably—*homely*. I can work,—do housework, fancy work, play the piano, draw and paint, and if necessary piece quilts. I have pieced one quilt in my life—when I was eleven years of age—and I sincerely hope it may be my last one! How could our Mississippi Cousin endure putting piece after piece of material together until she had the vast sum of eleven bed-quilts? Did her brain never weary while counting the almost countless number of pieces that are sometimes required to make one of those elaborate pieces of bed covering? 'Tis all nonsense, Cousins, the cutting of cloth in pieces, and then sewing it together again! I can tell my Cousins a better plan than that, if any would like to know it. I am fond of music, but do not like practice. "Practice makes perfect," so my mother tells me. I delight in literature, and my favorite authors are H. W. LONGFELLOW, Mrs. H. B. STOWE and LOUISA M. ALCOTT. I also like the writings of the poets GRAY and CAMPBELL. What has become of all the *youngsters?* I mean "Young Student," "Young Hach," "Young America" and "Young Naturalist." I fell quite in love with the latter young gentleman, but fell speedily out again for reasons. Young man, fulfill your promises and redeem your character, and perhaps I'll fall in again. Why do you not write to the RURAL again? Have you been too busy fishing and hunting to think of your Cousins? I wonder what has silenced "Young Buck." Has some fair damsel done it? Has he indeed been demolished by a wagging tongue? If so, please write us one more letter, and tell us "the truth, the whole truth and nothing but the truth" of the matter. In imagination I hear some of my Cousins say, "What a supremely silly letter, and how very uninteresting." But, dear Cousins, please excuse me if I have written in a disagreeable manner, and if you frown on my attempt this time, I shall be afraid to venture on the "sea of literature" again, and if Mr. Editor will kindly overlook and print this he will confer a great favor on the country girl who signs herself—YOUNG ARTIST.

P. S.—Perhaps I should have told you why I sign myself Y. A.: I have begun the study of drawing, and besides having made considerable progress ("some more of her egotism," I hear you say), I have a natural talent for it, so I am told, and I thought the most suitable *nom de plume* would be the most truthful one.—YOUNG ARTIST.

P. S. S.—A writer once said that all school-girls used several postscripts to their letters, and I, to keep truthful the statement, will add two to this letter, and will here say that if any of the RURAL readers would like to correspond with "Young Artist," I will, if I ever chance to write again, give my address.—YOUNG ARTIST, *Poplar Place, Pa.*

From a Nothern New York Boy.

DEAR EDITOR:—The picture and story about the pigs swimming across the river, which you printed March 11, reminds me of the bull swimming the St. Lawrence River. A farmer residing near Chippewa Bay, N. Y., bought a bull in Canada and brought him across on a scow and put him into the pasture with the other cattle, thinking all was right. But the next day the bull was gone. He had started back across the river. The river is about four miles wide at the place, and when half way across the animal was captured by two Frenchmen from Ogdensburgh, who were out fishing. They towed him ashore where my grandpa lives, and came up to the house and one of them said to him, "You lose your bull? we found one in the steamboat channel,"—and that was all he could tell. I guess the bull did not like the Yankees.—WM. H. ALLEN, *Hammond, N. Y.*

From an Illinois Boy.

DEAR MR. EDITOR:—I have been thinking a long time of writing a letter to the RURAL. We live six miles west of Woodstock. My father has taken your paper about ten years. I read the Boys' and Girls' Letters, and like them very much. We have got 155 acres of land; we got 400 bushels of potatoes from one acre. We had twenty-nine acres of corn, and the most of it was soft. The frost killed our cucumbers, and I was not sorry, because pickling them would have made my back ache; and pa wasn't sorry in the fall, because the pickle men went into bankruptcy. I must close.—WILLIE F. PARSONS, *Woodstock, Ill.*

From a Y Y Boy.

D R LITTLE COUSINS:—I am X C dingly fond of U all, & hope U will X Q Q me if you do not think this X L N T & Y Y. I wish U could C my sisters L A & K P; they R O so afraid of B H. I day we went 2 pick some P P for T, & I A saw 1 on the vines, & if U had C N how foolish she acted, U would have laughed as I did. I X pect 2 C her Y Y R, & hope I shall B somedime. From U R Cousin —L. M. K.

From a Missouri Girl.

DEAR RURAL:—I thought as so many of the boys and girls were writing I would like to write too. My friend "Wild Romp" brought the NEW-YORKER to school and I like it very much. I intend taking it. I would like to correspond with "Minnehaha," if it will be agreeable to her to do so; also "Young Tom."—LILLIE, *Canton, Mo.*

The Puzzler.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

THE DELAY IN CHEAP POSTAGE.

ABRAHAM LINCOLN once replied to an applicant who asked to have Secretary Stanton's orders overruled. "The fact is I haven't much influence with this administration." It begins to look as if the American people did not have much influence in the Government, which in theory they are supposed to create. More than a year they have been trying to secure the repeal of the increased postage swindle, and they haven't yet succeeded. Congress passed a bill restoring cheap postage some weeks since; but the matter lay untouched in the hands of the Senate Postal Committee until now Senator Hamlin has introduced a substitute, which is entirely impracticable and known to be so, and for no other reason that we can see but to continue the express monopoly. The Senate bill proposes to restore cheap postage only on short rates, charging higher prices for all third class matter to be carried 500, or 1,000 miles or more. This is practically a return to the inconvenient methods which prevailed thirty or forty years ago, and before the people had fully understood the advantage of cheap postage. It is impossible for thousands of people who are as much entitled to use the post-office as Senator Hamlin himself, to tell whether their mailable matter is within or without the area of cheap postage. One-half the postmasters even would be unable to decide in many cases what rates were legally chargeable, and from ten to twenty more clerks would be needed at all the large post-offices under such a law to answer questions.

The truth is our postal system needs simplifying, and this is almost as important as cheapness. A uniform and cheap rate for all parts of the country would add immensely to the receipts of the Post-Office Department and actually diminish the expenses. Under the present law, making absurd regulations against "frauds" the Post-Office Department pays the salaries of a good many thousand clerks whose sole duty consists in "peeking" into parcels to see that no writing is contained therein. Most of this labor is a good deal worse than wasted.

HOME NEWS PARAGRAPHS.

THE number of men supported in the Westchester County poor house is about 200, most of whom are idle nearly all the time. All those who are able will soon be set to work breaking stone, to be used for macadamizing the roads in the neighborhood.

In Kingsbury, Me., a deer came out of the woods near the residence of Thomas Kingsbury on the 13th inst. Mr. K. put on his snow shoes, chased the deer into a drift, caught and bound him with the strings of his snow shoes.

Matthew Doward's way of resenting a St. Louis girl's refusal to marry him was to throw vitriol in her face, and the law's way of punishment was to send him to prison for five years.

A remarkable natural curiosity is said to be visible in southern Louisiana. Ripe fruit of last year's growth is seen on many orange trees with partly grown green oranges from blossoms of early winter and fresh blossoms which have appeared at the proper time.

Prominent New York Republicans have taken steps to form a new organization for political reform.

Rents are 10 to 30 per cent. lower in New York City, this year than last. In some cases the reduction is more than 30 per cent.

The Howland School at Union Springs, N. Y., has had an addition of $30,000 to its endowment fund, through the generosity of one of its trustees.

The wife of a Norwegian in Iowa has recovered $9,500 damages from a liquor dealer, for selling her husband some liquor a year ago, in consequence of which he had his hands and feet so badly frozen that they had to be amputated.

The Governor of Minnesota has allowed the bill appropriating $38,000 for the relief of the grasshopper sufferers to die without his signature to it.

Vineland, N. J., the prohibition "stronghold," voted "no license" last week by a majority of nine hundred and thirteen in a total vote of ten hundred and thirty.

Captain Eads, who has the charge of the Mississippi jetties, has applied for the first payment on the work, alleging that the depth of twenty feet will be obtained in a few days. He says that the full depth of thirty feet will be secured soon after the close of the present session of Congress.

New York is not the only State which suffers from the indefinite re-election of County Treasurers. The treasurer of Midland county, Michigan, who has held the office for nineteen years, has just been found to be a defaulter to the amount of $22,000. He is under arrest.

Rubenstein, convicted of the murder of Sara Alexander, now in the New York Tombs, has had a slay of proceedings and hopes for a new trial.

A single vessel left Mobile a few days ago en route to Liverpool with 6,257 bales of cotton, worth $417,405.

A Roman Catholic's body was recently refused a place in the Roman Catholic Cemetery in Swanton, Vt., and the Protestants turned out in great numbers to bury it elsewhere.

A South Carolina boy's gun would not go off, and he heated an iron rod, dropped it into the barrel, and ran. The gun fell with the muzzle toward him, and the hot iron was driven into his body, killing him.

Peter Blackington, a wool manufacturer of South Adams, Mass., failed, and a few days after his old employees serenaded him with a brass band, gave him a gold-headed cane and one of them made an elaborate and sympathetic speech.

The Smithsonian Institution is making a collection of specimens of the animals of the United States that are hunted or trapped for economical purposes; and also of the different apparatus used in their capture by hunters, trappers and sportsmen.

It is reported that President Grant is anxious to sell his Long Branch mansion before the expiration of his term, and that he is looking for a purchaser. It also said that the President will spend the summer at Newport instead of the Branch this year.

Columbus, Ga., claims the position of the Lowell of the South. She is now running 35,000 spindles and 1,000 looms, besides many iron and other industrial enterprises. The city was destroyed in 1865, and all these have been replaced since with Southern money.

Virginia City was not a good place for a broker to go into the business of selling puts and calls on mining stocks. The miners, whenever a good lead was struck, at once came up from underground and invested their money accordingly. The broker was financially so far behind after a few days that he went out of town in the night.

The Massachusetts Board of Health have made the important discovery that most of the inhabitants of that State, above five years of age, eat pie twice a day. Massachusetts must be the place Charles] Dudley Warner had in mind when he wrote of "a region of perpetual pie."

The Fall River mills are now sending out 15,000 pieces of printing cloths per week, for the use of Manchester printers, and are preparing to increase the export to 25,000 pieces weekly.

It has been decided that the sum of $1,200, being the residue of the funds collected in England for the Stonewall Jackson statue, shall be invested in safe securities, and the interest devoted to procuring a gold medal for presentation to the first graduate in each class, year by year, of the Virginia Military Institute.

It is the purpose of the Democratic Senators to hear Mr. B. H. Dana's defense on the charge of perjury and literary piracy before voting against his confirmation. Should these charges be refuted, Mr. Dana stands a very good chance of being the successor of Gen. Schenck as Minister to England.

The explosion at Woodlawn Hights, Westchester County, by which three lives were lost, does not deserve to be called an accident. It was the natural result of a management so careless that it amounted to a crime. The inquest shows that the employes of the powder factory were in the habit of smoking cigars and pipes on the premises, and that the explosion was directly caused by throwing down a burning match after lighting a pipe. The owners of the factory are quite as much to blame as the unfortunate employe who thus brought instant destruction upon himself.

A terrific hurricane passed over St. Charles, Missouri, Sunday, March 19, Kramer's warehouse and the gas works were totally wrecked. James Ganey and his son were killed in the gas house. Sam Ganey and several others were badly injured. Rufus Robbins' residence near the city, was razed to the ground and a boy is missing. The court house, county jail, German Methodist Church, St. Charles Savings Bank, Park House, Odd Fellows' Hall, the new Zeitung, Democrat and Hour offices and the railroad depot were badly damaged. The storm lasted five minutes and presented the appearance of a huge rolling yellow cloud. Loss estimated at $500,000.

Mr. William L. Stone of N. Y. City has been appointed by the New York Centennial Commission "Centennial Historian for New York State." The Commission invite the historical, antiquarian, collegiate institutions, and public libraries of the State, as well as individuals, to furnish Mr. Stone with any materials, catalogues, &c., in their possession.

The water in Lake Pontchartrain is higher than it has been since the great flood of 1871. The Bayou St. John—the water from the lake meeting there the flood of rain water from the city—overflowed its west bank, March 19th, and much damage was done to gardens, &c., in the outskirts of the city. Nearly 20 miles of the New Orleans and Mobile Railroad are submerged and doubtless greatly damaged.

On the summit of Pike's Peak, over 14,000 feet above the sea level, where there is not a trace of any vegatation, or, indeed, any earth upon which shrubs or grass could grow, the mountain rat, an animal twice as large as a Norway rat, abounds in vast numbers, overrunning the United States signal station on the apex of the mountain.

The special committee, consisting of Messrs. Morgan, Sloane and Dickson, to whom was referred with power the plan of funding Erie coupons, have agreed with the foreign bondholders committee to recommending the funding of first consolidated bond coupons for five years, paying in cash alternate coupons, and the second consolidated bond coupons for five years without any cash payments. The foreign committee return to England by steamer of March 25. Both committee reports, in possession of President Jewett are unanimous. There are some details in the statement which the officials do not now make public.

At Newport, R. I., March 21, the steamer Old Colony was damaged $3,000 worth by a collision. She was repaired.

The "New York Woman's Guild" has arranged for a series of eight free entertainments and valuable lectures for the working women of N. Y. City in the great hall of the Cooper Union, two evenings in the week for the next month.

A girl in Richmond on Sunday week, recited the whole of the Psalms and part of Ecclesiastes, 4,600 verses in all, which she had committed during the week previous. The Sunday before she recited 2,000 verses, comprising the Epistles to the Romans, Galatians, Philippians, and one or two others. She is bound to have the prize, but is more likely to have a brain fever.

FOREIGN NOTES.

COREA and Japan have been on bad terms, but all danger of hostilities is now averted. This is fortunate, since war would have retarded progress in Japan, and injured American interests in that quarter.

The Captain-General of Cuba levied $36,000,000 in direct taxation.

Gen. Latorre has become Dictator of Uruguay.

The yacht Octavia was captured off Culebra Island, near Porto Rico, March 16, by the Spanish gunboat Hernan Cortes, and was taken to Porto Rico. She is supposed to have some connection with Quesada, who left New York March 1. Her cargo consisted of 243 boxes of powder, 48 boxes of cartridges, 12 boxes of shells, 1,000 rifles, 150 carbines, and two pieces of artillery. It is not known whether the yact had any people on board besides her officers and crew. The capture is remarkable as the Cortes is a slow steamer, her boilers being in bad condition.

The English House of Commons has voted by a large majority to give the Queen of England the additional title "Empress of India." Of course the Prince of Wales, when he becomes king will succeed to the title as Emperor of India. The Disraeli Government made this title a party measure, and the English Liberals by generally opposing it have incurred her Majesty's serious displeasure. That Queen Victoria should care for this unmeaning title shows that she has the full share of the weaknesses which pertain to human nature. Her position as Queen is more ornamental than useful and the addition of a new title can only please a very weak vanity.

The Vienna correspondent of The London Standard says a dispatch received from Cattaro announces that a treaty of alliance between Servia and Montenegro was decided upon March 16.

Signor Minghetti presented the financial statement in the Chamber of Deputies at Rome, March 16. He said the deficit for 1875 was only 20,000,000 lire, instead of 77,000,000, as was anticipated. The budget for 1876 shows a surplus of 10,000,000 lire, and that for 1877 would show a surplus of 15,000,000.

Weston's tongue is outdoing his legs in England. He tells the Britons in speeches that, at home, he is a Methodist clergyman and an editorial writer for The Sun.

Just ten years ago the English sculptor Gibson died at Rome, and bequeathed $300,000 to the Royal Academy, provided his works should be exhibited. This has not yet been done.

A letter from India says that the visit of the Prince of Wales to the theater in Calcutta, intended to be made an ovation, was badly managed. The managers supposed that the Indian rajahs and princes would pay for admission any price that might be demanded, and the scale was fixed at $15 for a stall, $250 for a box holding four persons, and $500 for a box holding six. There would have been less than 100 present had it not been for the speculation of a native. He bought most of the stalls to sell again, but was compelled to offer them for about $2 apiece or find no buyers.

Intelligence has been received at Bombay announcing the appearance of the plague on the banks of the Euphrates.

The Moscow Gazette says that on the 6th of February a troop of wolves attacked near Moscow a number of persons traveling on sledges. One person only succeeded in making his escape, thanks to the swiftness of a horse; twenty-three persons were torn to pieces.

President MacMahon has again evinced his readiness to be in accord with popular opinion, by superseding or placing on half pay 13 Prefects, and transferring 11 others. Since their victory at the polls, the Republicans have regarded the positions of these refractory officials as a part of the spoils, which as victors they could not forego.

A grand winter garden is being erected by the King of the Belgians close by his palace at Lacken. It will have a roof 120 feet high, so constructed as to need no support in the center, and permit the tallest trees to branch out freely.

The Treasury Department received a telegram from London, March 23, giving the price of silver at 52¼ pence, British standard, corresponding with 103¼ cents per ounce United States standard making a dollar in silver coin worth 83 2-10 cents in gold.

An exhibition which is to last 100 days, was opened at Kioto, in Japan, on March 15. During this period and for a week after foreigners will be permitted to visit Kioto, and also to exhibit any article.

At a fire in Edinburgh the firemen stole jewelry from the burning houses, and got so drunk that many were found, hours afterwards, lying in the street. Consequently the brigade is to be reorganized.

There has just been sold at auction in Paris a kandjiar (a sort of sword) which belonged to the father of the present Shah of Persia; it had 42 notches on its blade, showing that it had destroyed the lives of 42 men; it brought $8.40; just 20 cents each victim.

English shipbuilders have just completed several ironclad gunboats for the Argentine Republic. They are of the most powerful class, draw only eight feet of water, are fitted with twin screws, and have a speed of about ten knots an hour. Each carries a 26½-ton 11-inch rifled gun, which is loaded by hydraulic machinery.

THE SEASON, CROPS, PRICES, ETC.

Richland District, Ohio Co., West. Va., March 24.—This has been one of the most remarkable winters that it has been my lot to see. Some days warm enough to plant corn, and it may be the next day cold as Greenland. But to take it on an average, it has been rather a mild and open winter. There was but one day the mercury fell as low as zero; but we had several spells as cold as 3 and 12 deg. Such a day as March 20 we seldom ever saw. It commenced snowing in the morning and continued all day and part of the night till it laid on the ground about 10 inches deep, and it is still there; but there is some hope of it going off, as it has commenced raining. I tell you, Mr. RURAL, it begins to look a little discouraging to those who have much sod to break, as the ground is so wet it will take it a long time to get dry. Concerning fruit, as far as my observations have went and judgment goes, I don't think we shall have anything like fruit of any kind. The early peaches were killed in February; but the late and common varieties were all right till the last freeze of the 18th and 19th of March, which has finished everything. The apple buds were nearly all bursted open, and since then they have all turned black. Wheat on good and dry land looks very promising; but that on wet and spouty ground is badly frozen out. Stock has come through the winter in pretty fair condition, except sheep, which look a little the worse on account of so much wet weather. Grain still continues low, except wheat, which is a fair price, $1.25@1.50; corn, 40@45c.; oats, 40c.; hogs, 8c.; grass cattle, $3,50@5.50; butter, 35c.; eggs, 12c. Hired help, $15 per month and board.—L. H. BRUNER.

Chapel Hill, N. C., March 20th, 1876.—For the last four or five days I have been at a great wedding. You have heard of "the couple" before. The occasion has not been at all pleasant. The bridegroom is old Mr. December, with his snowy locks and swarthy face; the bride is Miss May with her blooming cheeks and budding beauty. Weeks ago I sent you some little flowers from the open border. Since then garden and orchard have arranged themselves in lovely bloom. The flowers that are prized only for their beauty appear to be more weather-wise and weather-proof than many that are prized as the promises of luscious fruit. Not many of the former have been cut down by this withering storm; but the peaches and pears, and cherries have risked all, or nearly all, and have lost all. It saddens us to think that we are denied the pleasure and profit of the peach for still another year. I have hope that some of the pears are so backward as to have escaped. Very few of the apple trees have bloomed. Only one of 16 in my yard and garden appears sufficiently advanced to be seriously affected. At Ridgeway, in this State, there are very extensive orchards of the peach, and I learn the whole crop was destroyed by the cold on the night of the 17th ult. After a very delightful, spring-like season, the weather turned cooler on the 16th ult. The 17th of March came out on a Centennial rampage. I do not remember ever to have known such a storm of wind without a tempest cloud. The temperature fell rapidly. The night seemed intensely cold. The 18th day and night, was very severe. The 19th the wind subsided, and the weather moderated. But we were all astounded this morning to find the ground covered with snow, while an Eastern wind was driving the mingled snow, hail and rain. To-night it is much warmer. The rain is pattering and the snow and sleet will soon be gone. 21st, cold and windy.—N. C.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 25, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	56,693	Rice, bbls	1,595
Whisky	2,254	Cut meats, pkgs	9,147
Corn meal, bbls	710	Lard, pkgs	2,352
Corn meal, bags	6,000	Tobacco, hhds	1,377
Wheat, bush	218,518	do. cases	3,768
Corn, bush	43,000	Butter, pkgs	12,211
Oats, bush	113,156	Cheese, bxs	16,411
Rye, bush	—	Cotton, bales	9,389
Malt, bush	37,881	Rosin	7,114
Barley, bush	16,200	Spts. turp., bbls	939
Beans, bbls	8,580	Dried Fruits, pkgs	362
Grass seed, bags	6,022	Eggs, bbls	17,700
Beef, pkgs	1,578	Peanuts, bags	1,428
Wool, bales	156	Dressed Hogs	1,061
Hops, bales	1,357	Leather, sides	96,794
Pork, bbls	5,821	Sugar, hhds	15
Tallow	570	Oil cake	8,640
Molasses	32		

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise, many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else.

BEANS AND PEAS.—Exports of beans past week, 1,500 bbls.; since Jan. 1st, 16,325 do.; same time last year, 6,063 do. Exports of peas past week, 9,461 bush.; since Jan. 1st, 218,322 do.; same time last year, 121,340. Medium beans are a shade steadier, owing to reduced receipts. No large business yet to note. The export demand for mediums is not large, but enough to support prices. Pea beans are not in large supply—not many seem to be wanted. Kidneys of all kinds remain quiet. Peas are generally nominal; if there is any variation since our last, it is in buyer's favor. We quote:

We quote Beans, pea, new, prime, $1.25@1.30; other, $1.00@1.20; medium, new, prime, $1.15@1.20, good, 90c.@$1; very poor, 50@80c.; marrow, new, prime, $1.65@——; other, $1.30@1.60; white kidney, prime, $1.50@1.70; fair to good, $1.30@1.50; red kidney, new, prime, $1.35@1.40; fair to good, $1.00@1.20; California Lima, choice, $2.40@2.50. Peas, Canadian, bbls., new duty paid, $1.15@1.19; gulk, in bond, 95c.@$1; green new, ₱ bush., $1.50@1.55; Southern B. E., ₱ 2 bush. bag, $2.75; split peas, Canadian, free, ₱ bbl., $6.

BEESWAX.—Offerings of choice lots are light, and full prices prevail. Western quoted at 32½@33c., and Southern at 34@34½c. Exports past week, 3,735 lbs.; since Jan. 1st, 31,083 do.; same time last year, 38,069.

BROOM CORN.—There is very little doing, with prices held as before.

We quote Brush, short green, 9@10c.; hurl, green, 8½@10c.; green, medium, 5@7c.; red and red-tipped, 3@4c.

BUTTER.—There is little new to remark about old butter; its firmness increases with its diminution and the market bids fair to be well cleared out by the time we get well into new, if not before. Really fine table grades are not put out as freely as the demand would like. Some of our dealers are forced to retain a reserve of such qualities as long as they can, as they have a class of trade that will not use early stall-fed stock. New butter arrives regularly but sparingly, and our prices are firm. Roll butter is scarce. At this season a few directions are in order to those who are not posted. One of our exchanges very clearly gives the ideas of the trade, as follows:

"Use only salt tubs; let them be as near uniform in weight as possible so as to make little variation in tares. Let each dairyman select a certain sized tub and adhere to it throughout the season so that his dairy will be in packages of uniform size. We also suggest that sizes should be selected which would hold a close average of 40, 50, 60 or 80 lbs. net weight of butter. Avoid using loose salt in the bottom of the tubs or on the sides. Soak the tubs thoroughly in strong brine before putting in the butter. Leave this salt off the top of the tub also—use instead a cloth, free from starch, thoroughly soaked in brine and not wrung out—when the dairy is sent to market. These remarks refer particularly to dairymen of this State, but they may well be read by Western makers also."

We would further caution the use of coloring matter. The attempt to impart a "grassy tint" is rarely successful, and as a general thing does more harm than good. Dont limit new butter to a price, its management at this season above all other times should be discretionary with the merchant.

New butter, prime, 40@——c.; fair to good, 35@38c.; half-firkin tubs, prime, 38@40c.; fair to good, 33@35c.; Welsh tubs, prime, 37@38c.; fair to good, 33@35c.; Pails, Western creamery, prime, 40@——c.; fair to good, 35@37c.

Old State dairies, extra, 36@37c.; entire, good to prime, 32@35c.; fair to good, 31@33c.; firkins, selected fresh, 37@38c.; good to prime, 33@35c.; fair to good, 28@31c.; half-firkin tubs, selected, 40@42c.; good to prime, 36@38c.; fair to good, 32@36c.; poor to fair, 22@32c.; State, Welsh, tubs, fall made, 30@33c.; dairies, 31@33c.; good to prime, 31@33c.; fair to good, 30@33c.; poor to fair, 20@26c.; Pennsylvania, store packed, 18@33c.; Western, dairy tubs, selected, 33@35c.; good to prime, 31@33c.; tubs selected fresh, 30@31c.; good to prime, fresh, 31@33c.; fair to good, fresh, 27@30c.; poor to fair, fresh, 17@26c.; Western, early packed, selected, 26@28c.; good to fine, 24@25c.; fair to fine, 20@22c.; poor, 16@18c. Roll butter, Mich. & N. Ills., fancy, 32@33c.; good to prime, 29@31c.; fair to good, 27@29c.; poor to fair, 22@26c.

CHEESE.—There has been a moderately active market only, but prices have scarcely varied. Fine, with the small stock, held firmly.

New State factory, fancy, 14¼——c.; fine, 13¼c.; do. good to prime, 12@13c.; fair to good, 10@12c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12¾@13c.; good to prime, 11@12c.; fair to good, 10@11c. Western factory, cheddar, fine, 12¾@13¼c.; good to prime, 11@12c.; flat fair, 8@11½c.; poor to fair, 7@8c.

COTTON.—A very fair export trade has been reported, and prices are higher and strong. Closing prices are 13 17-32c. for March, 13 17-32c. for April, 13 25-32@13 13-16c. for May, 14 1-16@14 3-32c. for June, 14 9-32@14 5-16c. for July, 14 7-16@14 15-32c. for August, 13¾@14¼c. for September, 11¾@11¾c. for October, 11 1-16@14¼c. for November, and 14 1-16@14¾c. for December.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	10¾	10¾	10¾	10¾
Good ordinary	11¾	11¾	11¾	11¾

Strict ordinary	11	Middling	12¾

DOMESTIC DRIED FRUITS.—Apples are moving off slowly, and easy prices are necessary on large lots. Peaches, blackberries and cherries are lower and dull. We quote:

Apples—State, sliced, 9¾@10c.; do., quarters, 9c.; Western quarters at 8½@8¾c.; southern sliced, 1875, prime, 10c.; fair lots, 8@9c.; Tennessee qrs., 8¼@8½c. Blackberries, 10@10½c. Peeled peaches, good and prime Georgia, 14@15c.; do. fancy, 16c. Unpeeled peaches, new, 12@12¼c. for halves, and 10@11c. for quarters. Plums, 20c. Raspberries, 25c. Cherries, 18@20c.

EGGS.—The movement has been better and the annexed rates have ruled quite steady. Early in the week there were indications of an advance, but the stock is too large for high rates to rule, and sellers have offered freely. We quote:

Jersey, single barrels, ₱ bbl., 18c.; State and Penn., 17¾c.; Western, prime, 17c.; do. fair marks, 16@16½c.; Southern and Southwestern, 16@17c.

ESSENTIAL OILS.—We quote:

"H. G." oil peppermint, $4, in glass; Hale & Parshall do., $4@4.20 do.; pure in tin, $3 50; sassafras, 55c.; wintergreen, $3.12; spearmint, $3.50; pennyroyal, $4.

FEATHERS.—Unchanged. Live Western geese, 54@56c.; mixed, 35@45c. Common poultry feathers not wanted.

FRESH FRUITS.—Exports of apples past week, —— bbls. Since Jan. 1st, 3,981 do.; same time last year, 12,145 do. Apples are active; dealers are inviting further supplies of good stock. Florida oranges are in demand but not plenty. Catawba grapes are quotable at 6@9c. for a few special State marks. Cranberries strong. Strawberries from Charleston are abundant.; Floridas have to drop to the quotations given for Charleston. We quote:

Strawberries—Southern, prime, ₱ quart, 75@80c. Cranberries—Jersey, choice, standard crates, $4.25@4.50; good to prime, $4@4.25; "pony" crates, $3.50@4.00; choice bbls., $13@14. Nuts—Peanuts are in light demand and about steady; Hickory nominal. We quote: Peanuts—Virginia, per bush., $1.55@1.70; Wilmington, $1.80@2.00; do. Tennessee, 95c.@$1.15. Hickory nuts, shellbark, $1.

FLOUR.—An active business has been reported on export account, and prices strong.

Superfine State, $4.40@4.80; extra do., $5.10@5.15; superfine Western, $4.40@4.80; extra do., $5.10@5.75; No. 2, $3.30@4.10; extra round-hoop Ohio, $5.10@5.40; trade brands do., $5.45@7.25; white wheat extras, $5.90@7.25; St. Louis, $5.35@9.00; City Mills extra, $5 20@6.75; Southern at $4.35@5.00 for superfine; $5.25@6.45 for poor to choice shipping extras; $6.50@8.75 for trade and family brands. Rye at $4@5.10. Buckwheat flour at $1.90@1.90.

FURS AND SKINS.—The late table will be probably revised this coming week. Common skins have a wide range. Recent cable news from London quote coon, skunk, muskrat, opossum and otter lower, enough to mark our rates down, for most items, 20 per cent. Silver, cross and red fox, and fisher, steady.

GRAIN.—The export movement in wheat has been of a more restricted character. Accounts from abroad have been of a less favorable nature, and shippers have been disinclined to operate unless at a marked decline to prices, with slightly easier prices made. Latest sales of No. 3 Milwaukee spring afloat, fresh receipts, at $1.18; prime No. 2 Milwaukee spring in store at $1.28; $1.15½ for ungraded Milwaukee in store; No. 3 Chicago and Northwest spring at $1.14@1.15; ungraded and mixed spring at $1.08@1.20; rejected and inferior spring at $1@1.00; fair amber Western in store at $1.31; $1.22@1.47 for winter red and amber; $1.36@1.50 for white; $1.34@1.38 for No. 1 spring. Rye sold at 90c. for prime State. Barley malt at 95c. for two-rowed State. Corn is higher and active, the principal demand from the English market. Sales at 65¾c. for mixed Western, N. Y. inspection, afloat; 64¾@65¾c. for ungraded mixed Western; 65@65¾c. for yellow Jersey; 66@66c. for yellow Southern. Oats are more freely dealt in and higher sales at 48@52c. for white Western; 48@48¼c. for New York No. 2; 47½c. for New York No. 3.

HIGHWINES.—Selling at $1.13.

MAPLE SUGAR.—The demand is only moderate for sugar. Syrup slow of sale.

New prime sugar ranges at 14@16c.; fair to good, 12@13c.; old, run over, 10@11c.; old, ordinary, 8@9c. Syrup ₱ gal. of 11 lbs., 1@1.10.

HAY AND STRAW.—Exports past week, 600 bales; since Jan. 1st, 6 72; same time last year, 8,076. An active trade has been in progress for shipment, but at easy prices, on account of the liberal arrivals.

Bale hay is quoted:—Shipping, 55@80c.; retail qualities, 95c.@1.05; clover, 60@70c.; salt, 65@70c. Straw is quoted at $1.05@1.15 for long rye; 75@80c. for short rye; 60@65c. for oat.

HOPS.—The rise in prices here bitterly restricts export trade. Quotations are the same as last week, but it is difficult to get 19c. for fine stock. Receipts continue liberal—something over 1,600 bales for the week—while shipments are only 617 bales.

N. Y. State, 13@19c.; Eastern, 11@17c.; Wisconsins, 11@17c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias, 17@20c.

PROVISIONS.—Hog products generally have been active and at advanced prices; demand largely from shippers. Mess pork $23.35 for spot, March and April, $23.45 for May. Extra prime, $19, and prime mess $21@21.50. Boxed, dry salted shoulders, 9¼c. Tierced pickled hams, 13@14c. Bacon at 13c. for Western long clear, 13½c. for city do., 13¾c. for Western long and short clear, together, 13¾c. for short clear. Lard—Western steam at 14-35c. for spot lots and March, 14-30c. for April, 14-37½c. for May, 14-47½c. for June, and 14-57½c. for July. Stearine at 15½c. for choice. Tallow at 9c. for prime. Beef hams at $21@25. Beef—New extra mess at $12.50@13.50; do. plain $12,50; new tierced at $13 for prime mess, and $25 for India mess. City extra India mess, $31.50@32.

SEED.—Clover is less active on account of the high prices asked. State, choice, 17c.

POULTRY AND GAME.—Dressed poultry is scarce, and were it not for the opening of frozen we would hardly have had a supply. We quote Philadelphia chickens at 20@22c.; capons at 30@31c. for large, and 25@27c. for small capons and slips.

Chickens, Bucks Co., good to prime, 19@20c.; Jersey, good to prime, 17@19c.; State, good to prime, 16@18c.; Western, good to prime, 15@17c.; fair to good, 12@15c.; poor, 6@10c. Turkeys, Jersey, good to prime, 20@22c.; State, good to prime, 19@21c.; Western, good to prime, 16@18c.; inferior, 12@15c. Ducks, Jersey good to prime, 22@24c.; State, good to prime, 21@23c.; Western, good to prime, 20@22c.; fair to good, 18@20c.; poor, 14@16c. Geese, Jersey, prime, 15@16c.; State, good to prime, 12@14c.; Western, good to prime, 12@15c.; do., poor to fair, 10@13c.

Frozen poultry quoted at 18@20c. for turkeys, 19@22c. for ducks, 14@15c. for prime chickens. Frozen chickens are not keeping well; they rarely do turn out as good as turkeys.

Live poultry has sold well in the absence of dressed. Young chickens are offered in advance of the demand. We quote:

Turkeys, Jersey, ₱ lb., 16@17c.; do. Western, 15@16c.; Geese, Jersey, ₱ pair, $2.50@3; do. Western, $1@1.50; ducks, Western, ₱ pair, 70@80c.; ducks, Jersey, ₱ pair, $1@1.50; fowls and chickens, State and Jersey, ₱ lb., 15@16c.; do. Western, 14@15c.; roosters, 8@9c.

In game, wild pigeons are scarce and high. Market not oversupplied with any kind. Western wild ducks continue poor in quality.

Wild ducks at $1@1.25 for Canvasback; 75@$1 for Redhead & 25@35c. for Mallard; Havre de Grace Canvasback have sold at $1.50@1.75 per pair. Wild pigeons, feathered, ₱ doz., $2.37@2.50; English snipe, $4@4.25; plover, $3.25@3.50.

TOBACCO.—Export trade still light, most parties awaiting developments through the increasing supplies of the new crop.

KENTUCKY LEAF.—NEW CROP.

	Light. Cents.	Heavy. Cents.

VEGETABLES.—Exports of potatoes past week, 3,054 bbls.; since Jan. 1st, 38,413 do.; same time last year, 27,553 do. Exports of onions for the week, 165 bbls.; since Jan. 1st, 4,138 bbls.; same time last year, 1,158 do. It is the old story about potatoes: trade is dull, prices low and shipments this way altogether discouraged. Good Ohio Peach Blows in double heads offered at $1. Onions are firm. Bermuda potatoes quoted at $6@6.50 ₱ bbl. Tomatoes, $2.50 ₱ 6 quart box. Florida green peas, $2@3 ₱ bush. Old cabbage preferable to new Southern.

Early Rose, bulk, ₱ bbl., 90c.@$1.25; Peach Blows, $1.00@1.37; Prince Alberts, 87c.@$1.12; common, 50@80c. Sweet potatoes, $2.50@3.00. Cabbages, ₱ 100, $4@6; red, $6@10. Squash, Marrow, bbl., 75c.@$1; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.37@3.50. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00. Southern spinach, ₱ bbl., $2.50@2.75. Kale, $1@1.25.

WOOL.—There continues a very dull and unsatisfactory market. Manufacturers are indisposed to purchase other than small lots, with rather a pressure to sell against arrivals of the new clip.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., March 25, 1876.

TRANSACTIONS this week have been light and there has been no improvement in prices. Several lots of cheese were sent forward on commission. Farm dairies may be quoted at 9@11c., and factories at 12@13c. The Fairfield Association is still holding its goods at 14c.

About 200 tubs of butter were offered, two dairies of which was from new milk. The new make went at 28@32c., and in some exceptional cases 33@34c. were paid. Old grass made brought 27@31c.; winter, 24@28c.

We have advices from Europe to the first week of March. Our London correspondent says:

Fine English cheese scarce; medium is plentiful but dear, comparatively; Dutch is short and of bad quality, though realizing long prices. American stocks are moderate and nearly all medium and low. Fine September make is scarce and wanted at extreme quotations.

English cheddar brings 82@94s.; Wiltshire double, 68@80s.; Cheshire medium, 56@68s.; fine, 74@86s.; Scotch, 70@78s.

There is no fine butter landed, but intermediate and substitutes sell well, with every prospect of none being left over. The prices are as follows:

Jersey sells for 100@148s.; Horsgts. 176s.; Danish and Swedish, 100@176s.; Friesland, 156s.; Normandy extra, 140@168s.; American and Canadian, 80@130s. ₱ cwt.

Oleomargarine or artificial butter, 56@130s.

BEEVES.—Trade opened with a slightly better feeling on last Monday, and the markets closed firm, with only a few head of horned cattle unsold; the quality of the herds on hand ranged from poor to good, only 20 head of choice quality beeves being on sale. Prices were 9@13c. ₱ lb.; weights, 5¾@10 cwt. Wednesday, trade slow but firm; the herds on sale were chiefly of coarse quality, and sold at 9@12¾c.; weights, 5¾@8¾ cwt. Thursday, sales slow at 9¾@11¾c.; weights, 6¾@8¾ cwt. Friday, the markets closed fair at 9¾@12¾c.; weights, 6@9¾ cwt. From 85 to 88 lbs., net, has been allowed to the cwt. Spanish steers, corn-fed, sold at 9¾c.; oxen, 8¾c.; native steers, 9@12c.; grade steers, 12¾@13c.; mixed herds, 9@11c.; State and Western oxen, 9@11¾c. Bulls on live weight, 3½@4½c.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13	12 @13¾
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	8 @ 9¾	8 @ 9¾
Gen. selling rates	9¾@11	9¾@10¾

MILCH COWS.—Trade still more depressed and quality inferior. General sales at $10@55 ₱ head; extreme range, $30@75; 8 cows sold at $10@60 ₱ head; 5 at $50@90; 10 at $35@65; 7 at $45@53.50—calves always included.

VEALS AND CALVES.—Trade fair in smooth quality veals at 9@10¾c. ₱ lb.; sales slow in coarse quality meal-fed calves at 7@8¾c.; grass calves not quoted. State calves from Western New York sold at 7@8c.; Pennsylvania, 9½@10¼c.; Jersey, 10¾@11¾c.

SHEEP AND LAMBS.—Monday last trade opened slow. Sheep sold at 6@6c. ₱ lb. Wednesday, sheep fair of sale at 6¾@8¼c.; yearling lambs, 7¾c. Thursday, trade small in sheep at 6¾@7¾c. Friday, the markets closed fair; sheep, 6¾@8¾c.; lambs, 8¾@9¾c. Michigan sheep sold at 7¾@8c.; Ohio, 6¾@8¾c.; State, 6@7¾c.; Pennsylvania, 7¾@8¾c.; State lambs, 7¾c.; Michigan, 8¾@8¾c.

HOGS.—Trade not reported in live hogs up to Wednesday at noon; on Thursday and Friday still none on sale. City dressed opened slow on Monday at 10¾@11c., and were no easier of sale on Wednesday, when prices were 10¾@11¾c. Thursday and Friday trade slow; both days rates were 10¾@11¾c.; Western dressed, 10¾@10¾c., supply light.

HORSE MARKET.—During the recent cold weather city trade in horses was nominal, but with a return of a milder temperature business improved. One pair choice quality heavy draft horses sold at $600; 1 pair stylish carriage horses, $1,000; 5 pair family do., $300@550; 19 head poor quality light harness horses, $52@95; 22 head ordinary do., $110@250; 7 head of roadsters with fair trotting action, $279@325; 1 trotter, $500. Thirty-two horses arrived per Erie Railroad via Oak Cliff Station.
